Fredericksburg Historic District Extension (111-0009) in Relation to other NRHP-Listed Historic Districts in the City of Fredericksburg

02/2018

\\DTS2\Main Job\14-015 RAPS\GIS\2018Work\14_015_AH_PhII.mxd | Last Updated: 03.08.2018

Fredericksburg continued to prosper as a port town into the nineteenth century. In fact, by 1840, over $4 million worth of goods were being shipped annually from its ports (Willis and Felder 1993:6). To facilitate the movement of those goods, local merchants and officials began discussing plans for a new canal system. Construction on the Rappahannock Navigation System, which comprised a network of dams, locks, and canals, began in the late 1820s, but a lack of funds delayed its completion until 1849 (André and Moore 2008:52). The new canal was one of the many reasons that the city boundaries were, once again, expanded. This increase, occurring in 1851, included many large tracts that are part of the Fredericksburg Historic District Extension (Johnston and Smith 2001:8–22). One of the new canal sections extended through the proposed district along the present-day route of Kenmore Avenue. Despite, or perhaps because of, the construction of the canal, residential development in this area continued to be sparse during this period. While the canal system was originally designed to help funnel water to provide water power throughout the city, many residents found the new canal ditches to be extremely convenient places to deposit household refuse, human waste, and other detritus. The canals soon became blocked and putrid (Fredericksburg Area Tourism Department 2017).

The town's burgeoning prosperity changed drastically in the early 1860s, with the onset of the Civil War. Numerous battles occurred within and around Fredericksburg, including a particularly bloody engagement known as the First Battle of Fredericksburg. On December 13, 1862, Union troops crossed the Rappahannock River, marching through the town to attack Confederate lines entrenched along some high ground to the west of downtown (today's Marye's Heights). Confederate forces deployed behind a stone wall bordering the present-day Sunken Road repelled a series of attacks until, finally, on the night of December 15th, Federal forces were finally forced to withdraw back across the river during (Marvel 1993:3; Willis and Felder 1993:52). This attack traversed almost the entire stretch of land that is now part of the historic district extension (Figure 3-102). The mostly undeveloped broad vista was the scene of indescribable horror, and the buildings in the soldiers' wake were damaged—some beyond salvation.

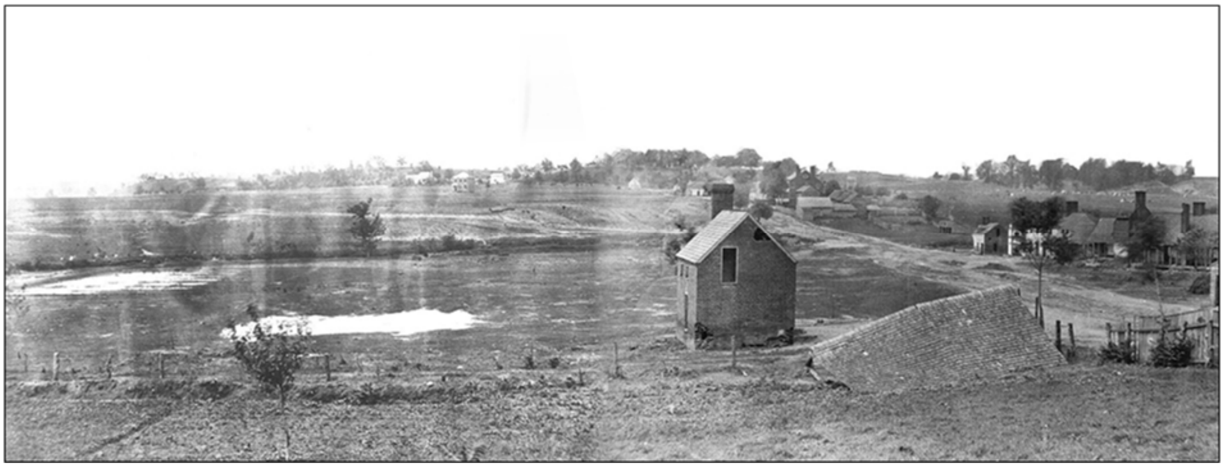

FIGURE 3-102: VIEW OF HANOVER STREET CORRIDOR AND MARYE'S HEIGHTS (REAR) DURING THE CIVIL WAR, LOOKING WEST (CIVIL WAR TRUST 2018). THIS VIEW IS LOOKING AT THE PROPOSED DISTRICT EXTENSION AREA.

The Civil War decimated the physical and cultural fabric of not only the extension area but the whole town and surrounding areas. The next decade was marked by economic decline and, as a result, new development was limited (Johnston and Smith 2001:8–23). Despite the destruction, however, area inhabitants remained in town, determined to rebuild their lives and their homes.

The community's population expanded after the war as emancipated slaves and white farm owners whose properties had been destroyed during the conflict, flooded into town looking for work in one of the growing number of industrial factories and mills.

The town grew so rapidly and so large that Fredericksburg was incorporated into a city in 1879 (Willis and Felder 1993). The rebuilding of the railroad in the 1870s, which had been rendered useless after destruction during the war, made the canal system essentially obsolete, but bolstered the community's emerging industrial economy (Malvasi et al. 2010:101). New roads were also built to and from Fredericksburg for area farmers and merchants to deliver and receive goods. Development sprawled from the commercial center to encompass new neighborhoods to the north and south of town, including the extension area.

By the 1880s, Fredericksburg had largely recovered from war's destruction, and new opportunities for growth were emerging. As a result, the areas surrounding the downtown district saw a spike in new residential development (Johnston and Smith 2001:8--24). The Fredericksburg Development Company (FDC), organized by a group of local businessmen, purchased a significant amount of land in and around town (Figure 3-103). This group, as well as several other ventures, purchased parcels in the extension areas and platted out smaller urban lots for future residential structures. A nationwide financial panic in 1893 stalled development activities for several years, and the FDC and other groups were forced to sell most of their holdings (Johnston and Smith 2001:8–30). Given this, development remained limited until the turn of the century even though some parcels in the extension area had been cleared and platted.

The late-nineteenth and early-twentieth-century industrial successes of Fredericksburg led to a tremendous need for housing, most notably for the emerging middle class. The lots in the extension district, already platted and within a moderate walking distance of town, were the perfect solution. Domestic residences sprang up along its streets by the dozens, and limited commercial, ecclesiastic, educational, and industrial buildings accompanied this growth.

In 1927, a new section of Route 1 connecting Richmond with Washington, D.C. was completed. The roadway passed through downtown Fredericksburg bringing traffic along Princess Anne Street and what is now Lafayette Boulevard. A year or two later, Kenmore Avenue was extended southward to Lafayette Boulevard covering the canal mentioned above. By the 1950s, a Route 1 bypass was created outside of town and through-traffic was diverted, most of the lots in the extension area had been developed. The few open lots were subsequently built upon in the second half of the twentieth century, leaving a densely populated and architecturally rich fabric.

3.8.2 Architectural Description

The Fredericksburg Historic District Extension (111-0009), encompassing approximately 40 blocks bordering the north, west, and south margins of the city's original 50-block downtown district, includes almost 500 buildings. The area encompasses a mixture of mostly nineteenth- and twentieth-century residential enclaves, with pockets of industrial and commercial development located along sections of the Princess Anne Street, Kenmore Avenue, William Street, and Lafayette Boulevard corridors. The existing housing stock exhibits a variety of materials and a wide range of architectural styles, including Italianate, Queen Anne, Shingle, Colonial Revival, and Craftsman, expressed in both formal and vernacular designs. Collectively, they reflect and embody the area's evolution from eighteenth-century outskirts to an inner-city neighborhood.

The oldest resource, Federal Hill (111-0030), is a frame dwelling at 504 Hanover Street, constructed circa-1794. The house exhibits a transitional design, blending elements of both Georgian and Federal styles (Figure 3-104). The building's odd angle when compared to the linear street grid reflects its early origins. Two dwellings in the district date to the early-nineteenth century, both of which survived the Civil War—the Freeman House on Littlepage Street and the Rowe House at 801 Hanover Street (111-0107) (Figure 3-105).

Although the vast majority of the building stock dates to the twentieth century, several domestic structures reflect popular late-nineteenth-century styles, such as the Italianate dwelling at 601 Spottswood Street and the Queen Anne-styled houses along Lewis and Winchester streets (Figures 3-106 and 3-107). While some early-twentieth-century residential buildings continued the tradition of using stylized and patterned designs, such as the dwellings constructed in the foursquare form found in the 800 block of Charlotte Street (Figure 3-108), some of the smaller lots in the extension area were the ideal site for working class homes. These dwellings tended to be frame construction and two stories in height and typically one room wide to fit on increasingly divided lots. A sample of these can still be seen in the 600 block of George Street (Figure 3-109).

The 1920s and 1930s brought an eclectic building stock to this area. While most of the construction tended to revolve around single-family dwellings, the designs varied from Colonial Revival, Tudor Revival, and Craftsman-styled houses to those embracing the bungalow and Cape Cod forms (Figures 3-110 through 3-112). Most of the buildings from the 1950s and into the late-twentieth century continued to be one- to one-and-a-half story residences with simple forms.

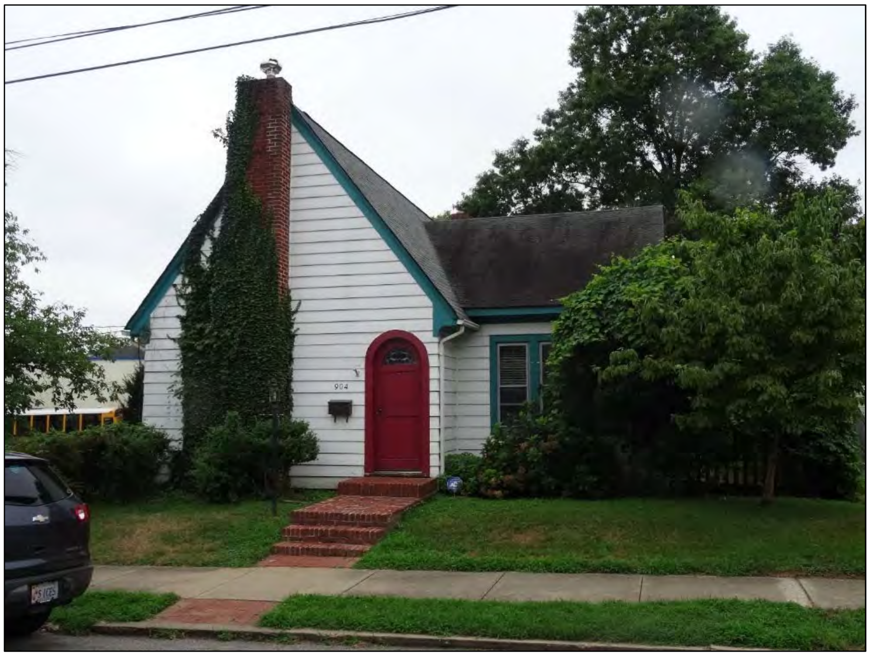

FIGURE 3-112: EAST ELEVATION OF A TUDOR REVIVAL-STYLED DWELLING AT 914 HANOVER STREET

Although the majority of the building stock comprises residential structures, early- and mid-twentieth-century commercial properties populate much of the north side of Lafayette Boulevard—a product of the corridor's one-time role as part of Route 1—and William Street. These include gas stations, restaurants, and service buildings (Figure 3-113). The Matthew Fontaine Maury School at 900 Barton Street (111-0009-0014), constructed in 1919, represents educational development which was needed as the city's population expanded (Figure 3-114). The extension area is also home to several churches, including, among others, the Classical Revival-styled Fairview Baptist Church at 900 Charlotte Street, built in 1925, and a 1930 brick church at 821–823 Lafayette Boulevard, which is now the local headquarters for the Salvation

Army (Figure 3-115). The Fredericksburg City Cemetery and north-adjoining Confederate Cemetery (111-0009-0129) also lie within the proposed extension area, on the northwest corner of William Street and Washington Avenue.

The twenty-first century is represented by pockets of new construction, including a new, mixed-use development (townhomes with ground-floor commercial space) on the north side of the 500 block of William Street and the Cobblestone Apartments complex built in 2012 between Lafayette Boulevard and the CSXT rail line at the south end of the proposed district extension (Figure 3-116). Instances of new residential, infill development were also noted throughout the project area.

3.8.3 NRHP Evaluation

The proposed Fredericksburg Historic District Extension (111-0009) embodies and helps to narrate the city's growth and evolution from late-eighteenth century, riverside port town to a modern city. The extension area as a whole retains sufficient integrity of location, setting, feeling, association, design, materials, and workmanship despite some modern infill, lingering neglect in some areas, and replacement of historic materials, which are common characteristics of consistently growing historic cities or towns.

Land that was once farmland on the outskirts of town became an important hub for residential occupancy during the late-nineteenth and early-twentieth centuries. While most of Fredericksburg's upper and upper middle class inhabited the areas closer to downtown, this part of the city was within walking distance to many of the city's establishments but offered those of the working class and middle class the opportunity to own a home on moderate-sized lots. The building stock directly reflects the eras of financial prosperity and economic hardships faced by this community. Beyond the residential development, the commercial buildings on the perimeter of the district directly reflect this area's importance as cross-route town as travelers traversed what was then Route 1 along Princess Anne Street and Lafayette Boulevard. It is therefore recommended that the district is eligible for the NRHP under Criterion A for its overall contribution to trends in community planning and development that exhibit broad patterns of history within Fredericksburg.

The resource has no known association with any significant event or person and therefore is recommended not eligible for the NRHP under Criterion B.

The architectural stock in the district ranges from modest, small-scale, vernacular, worker housing to large, high-style dwellings, interspersed with commercial, educational, ecclesiastic, and industrial places. Signs of deterioration and structural integrity issues were noted in the area resulting largely from vacancy, protracted neglect, and deferred maintenance. Other integrity issues observed include the replacement of historic fabric with modern materials, such as vinyl siding and windows; however these are common modifications. Some new, larger-scale, contemporary development was noted within the district extension area, including, for example, multi-story townhomes along the 500 blocks of Amelia, Winchester, and William streets, built 2015–2017, and a multi-unit residential complex known as the Apartments at Cobblestone, built 2010, at the south end of the extension area. Despite these integrity issues and some infill, the preponderance of the buildings in the district date to the late-nineteenth and early-twentieth century and provide an excellent cross section of building styles and forms which most directly represent the use of this area as a suburban-turned-urban residential enclave and exhibit many of their original character-defining features. This area also exhibits good examples of adaptive reuse, notably the former G. H. Manufacturing Plant, which was converted for use as office space, and the Matthew Fontaine Maury School (111-0009-0014), which now houses condominiums. Due to its disparate yet rich character and integrity, it is recommended that the district is eligible under Criterion C for its architectural merit. As an architectural resource, this property was not evaluated under Criterion D.

In sum, the Fredericksburg Historic District Extension (111-0009) is **recommended as eligible for listing in the NRHP under Criterion A for its overall contribution to the developmental history of Fredericksburg and Criterion C for its architectural merit with a period of significance of 1794, the year Federal Hill was constructed, through 1967.**

The Fredericksburg Historic District Extension (111-0009) encompasses an approximately 40-block area bordering the north, west, and south margins of Fredericksburg's original 50-block downtown Fredericksburg Historic District (111-0132), listed in the NRHP in 1971 (Figure 3-117). The eastern boundary of the extension district runs along the Rappahannock River at the north end, then follows the west side of the existing Fredericksburg Historic District midway between Prince Edward and Winchester streets, and along the west side of Dixon Street at the south end. To the west, the boundary extends southward along Charles Street for roughly three and a half blocks, where it intersects with the Washington Avenue Historic District (111-5262), Sunken Road, and the City of Fredericksburg and Confederate Cemeteries. At the south end, the margin stretches along Lafayette Boulevard, the Virginia Central Railway Trail, Hazel Run, and Dixon Street.

3.9 SLAUGHTER PEN FARM (088-0254)

The Slaughter Pen Farm property (088-0254) is located at 11190 Tidewater Trail (State Route 17), in the northeast corner of Spotsylvania County, Virginia. It adjoins the tracks of the former RF&P Railroad, approximately 2.5 miles southeast of downtown Fredericksburg, Virginia (Figure 3-118). This resource is a 200.61-acre historic farm with a Civil War landscape component. The extant built complex includes a circa-1898, two-story, frame dwelling and several frame outbuildings.

3.9.1 Historic Context

The Slaughter Pen Farm property, known also at different points as the "Wayside Farm" and "Pierson Farm," was originally part of a larger 4,972-acre land patent conveyed by the Virginia Colony Assembly to Major Thomas Laurence Smith in 1679. In 1728, Mann Page of Gloucester County, acquired a 3,500-acre patent in what is now Spotsylvania County described as the "westernmost corner of a patent granted to Lawrence Smith and Robert Taliaferro, both deceased" (Library of Virginia n.d.). The first member of the Page family to reside in Spotsylvania County however was Mann Page, III (1749–1803). He arrived in the early 1770s and erected a grand stone mansion along the south bank of the Rappahannock River (opposite the present-day Slaughter Pen Farm property), near the port of Fredericksburg. The new house became the center of large plantation estate Page had named "Mannsfield" (Gordon 1936:1–2).

When Mann Page, IV died in 1803, his estate was divided between his heirs. His widow, Mary Page, received as her dower the Mannsfield home and approximately 800-plus acres at the north end of the family's Spotsylvania landholdings (Spotsylvania County Will Book [SCWB] W-D C:200). Several years later, Mary remarried and moved to Prince William County. Her share of the Mannsfield estate was sold through several transactions to William Bernard (SCDB S:365, U:126, BB:463). The latter had relocated from King George County around 1811 and begun acquiring real estate in the Fredericksburg region, including, in addition to Mannsfield, an 845-acre tract known as Garnetts Quarter and a 160-acre property called Merry Hill (SCDB R:453, AK:76).

In 1836, a portion of Bernard's Mannsfield tract was conveyed to the RF&P Railroad Company (chartered in 1834) for a new rail line they were constructing (Griffin 1994; SCDB FF:371). A section of the railway, which reached Fredericksburg in 1837, extended along the boundary of the current Slaughter Pen Farm parcel's western boundary. Seven years later, in 1844, William Bernard passed away. His Mannsfield estate was divided into two sections and, his sons, Arthur H. H. Bernard and Nathaniel A. Bernard, drew lots to determine which part they would receive. Arthur was granted the Mannsfield manor house and 563 acres of surrounding land, and Nathan received the remainder (SCWB W-BB:16).

The Mannsfield estate was among the largest plantations in the area during this period. In addition to the main house and grounds, the built complex included an array of outbuildings of varying form and function spread out over the property's 1,800 acres. Among these were several clusters of slave quarters, built to house the Bernard family's 70-plus slaves. One of these, consisting of at least three, one-story, frame cabins and a stone-lined well, occupied a low knoll just west of the current Slaughter Pen property. A circa-1860s map depicts the small enclave (identified as "Bernard's Cabins") (Figure 3-119) (Hennessy 2010b; Swain 2008).

\\DTS2\Main Job\14-015 RAPS\GIS\2018Work\14_015_AH_PhII.mxd | Last Updated: 02.19.2018

The Civil War had a substantial impact on the Fredericksburg area and the Slaughter Pen Farm. On December 13, 1862, the Slaughter Pen Farm was the site of a violent clash between Union and Confederate forces during the Battle of Fredericksburg. Federal troops led by Major General William B. Franklin, crossed the open fields at Slaughter Pen to attack Confederate defensive positions located on some high ground in the woods just west of the RF&P rail line (Figure 3-120). Elements of a Union regiment commanded by General George Meade and John Gibbon successfully advanced to the woods, even reaching and crossing the railroad tracks, but were repelled by reserve Confederate forces called up by General Stonewall Jackson to counter the attack. The Federal troops were pushed back to the road (present-day Tidewater Trail/SR 17) and retreated. When the fighting had stopped, approximately 5,000 soldiers were dead (Rafuse 2011; Schemmer 2009; Sullivan 2011). The fighting was so intense and deadly that, in the aftermath, some Union soldiers gave the site a name: the “Slaughter Pen” (O’Reilly 2006:236). Sometime between December 1862 and May 1863, the Mannsfield estate’s main house was destroyed in a fire (Miller and Lanier 1911:22; Northington 1936). On the 1862 map, which was published in 1867, the word “ruins” appears next to the site (which is incorrectly identified as belonging to “Burnett” rather than Bernard).

An article on the Mannsfield estate written by a war correspondent for the *New York Times* in May 1865 noted that just prior to the Battle of Fredericksburg, the property's owner, A.H.H. Bernard, "a wealthy Secessionist, middle-aged bachelor," had reportedly attempted to cross the Union lines, but was captured and imprisoned. The article also mentions that the Mannsfield mansion house, which had been used as a hospital during the battle, had since accidentally burned (Northington 1936; Tiernan 1901).

It is unclear whether Arthur H. H. Bernard ever permanently returned to Spotsylvania County (the 1870 U.S. Census lists him as a resident of Richmond, Virginia). He died in 1891 and three years later, his heirs sold 290 acres of the family estate to Thomas P. Yerby for $1,500 (SCDB AH:288; Fredericksburg Free Lance 1891). The 1893 plat map shows the Bernard's partitioned Mannsfield estate (Figure 3-121). The 290-acre portion bordering the south side of the "Road" (present-day Tidewater Trail/Route 17), included the Slaughter Pen Farm tract, then 240 acres in size, and a north-adjoining, 50-acre parcel that, according to land records, had formerly been part of the larger Merry Hill Farm tract (Spotsylvania County Plat Book [SCPB] AG:224).

Following his acquisition, Yerby conveyed a deed of trust on the 290-acre tract, apparently to fund some planned improvements (SCDB AF:70). An extract from a 1904 suit between W. S. Embrey (plaintiff) and Thomas P. Yerby, Sr., recorded in a City of Fredericksburg Circuit Court order book, offers details concerning the new construction that occurred on the property during this period. According to the court records, a log tenant house with a two-story frame addition attached to one end was built on the Slaughter Pen tract in the "early winter" of 1894 (City of Fredericksburg Circuit Court 1904). Other improvements included a new barn/stable, a carriage building, a windmill, two tenement houses, additional outbuildings, fencing, and drainage ditches. The barn, erected at a cost of $1,800, was reportedly large, housing 40 stalls and space for feed storage. The court record also noted that the extant two-story, Italianate-styled, frame dwelling was constructed around 1898 by a local carpenter named Mason Garner (City of Fredericksburg Circuit Court 1904). A review of land records from this period also indicate that Yerby, who resided with his family on an 800-acre plantation to the south called Belvoir, apparently named his newly acquired property "Wayside" (SCDB 90:381, 488; 94:148).

Yerby sold small portions of the tract, including 5 acres on the south side of the RF&P rail line, to Richard M. Doswell in 1898 (SCDB AI:262) and another 2.0 acres from the southwest corner of the property to the RF&P Railroad in 1906 (SCDB AV:255). At some point in the early 1900s, Thomas Yerby developed health problems and moved his family to their Wayside property so he could be closer to his physician. In February 1907, he passed away following a bout with pneumonia (Findagrave.com 2017a). In the 1910 U.S. Census, his widow, Jane R. Yerby, is listed as the head of a household that included her daughter, Lena P. Yerby, and three grandchildren. Lena, was reportedly managing the family farm (U.S. Census 1910). In 1911, Thomas' daughter, Jane D. Yerby, married a gentleman from Caroline County named Victor R. Pierson (The Times Dispatch 1911). A decade later, in 1920, the U.S. Census listed Victor R. Pierson in residence at Slaughter Pen Farm with his wife, Jane ("Jenny") D. Pierson, and their three children. Victor's profession was described as a dairy and grain farmer.

Ownership of the property eventually passed to their son, John Wallace Pierson, who resided on the farm until his own death in 2005. In his obituary, published in the *Fredericksburg Free Lance-Star*, he was described as a "retired dairy farmer and an avid gardener" (Findagrave.com 2017b). In 2006, his heirs sold the tract for $12 million to the Civil War Trust; a nonprofit organization dedicated to the preservation of the country's significant Civil War-era battlefields (Schemmer 2014). After acquiring the property, the Trust placed the property under a preservation easement held by the DHR (DHR 2007:67).

In 2014, the Civil War Trust hired a contractor to demolish several buildings on the property, including a vacant house near the boundary with Shannon Airport, a frame milking barn, several frame sheds, and two wells (Schemmer 2014).

3.9.2 Architectural Description

The property known as Slaughter Pen Farm currently consists of a circa-1898 main dwelling, circa-1894 tenant house, two agricultural buildings, two domestic outbuildings, and a ditch fence (Figure 3-122). When initially surveyed in 1996, a substantial number of secondary resources were recorded in association with this property. In recent decades at least 11 buildings have been demolished at Slaughter Pen Farm, many of which were related to its twentieth-century agricultural use. However, the farm itself is best known for its role in the 1862 Battle of Fredericksburg.

3.9.2.1 Primary Resource Exterior

As detailed in previous investigations, the main dwelling at Slaughter Pen Farm is a late-nineteenth-century, two-story, three-bay, Italianate residence (Figure 3-123). It rests primarily on a continuous brick foundation, laid in American bond and extending to a one-story rear ell; however, the foundation of the north wing has been replaced with continuous poured concrete. The house's frame structural system is currently clad in vinyl siding and covered by a hipped roof sheathed in standing-seam metal. A wood cornice wraps around the two-story main massing of the house and is ornamented by dentils and scrolled brackets. Two interior, corbelled, brick chimneys pierce the roof of the main massing while a third chimney appears to have been relocated from the center of the rear ell to the exterior of the same. The main entry and other fenestration at the first floor was boarded over at the time of survey, but upper level windows are two-over-two (vertical muntins), double-hung, wood sashes. At the rear, or southwest elevation, a two-story, projecting, gabled bay extends from the center and a one-story ell extends from the south corner of the house—both of which appear original to its design (Figure 3-124). Two four-light, wood-framed, casement windows are located in the gabled ends of these extensions. A one-story, lean-to addition was made to the north side of central projecting bay, likely at the same time that the foundation around the north wing of the house was replaced. A lean-to porch was also added to the north elevation of the rear ell sometime in the early-twentieth century.

3.9.2.2 Secondary Resources

Two domestic outbuildings are located in proximity to the main dwelling, previously identified as a kitchen and shed (Figure 3-125). The circa-1900, one-story, one-room, summer kitchen has a frame structural system clad in weatherboard which is currently resting directly on the ground. The building is covered by a front-gabled roof sheathed in v-crimped metal and features a small interior-end brick chimney at the southeast elevation. A single-leaf entrance is located on the northwest elevation while a single, six-over-six, double-hung, wood-framed, sash window marks the center of both the northeast and southwest elevations. At the interior, the kitchen walls have been covered in drywall and a portion of the brick flue removed.

The building previously identified as a shed is better described as a cold storage building. Constructed from primarily concrete block circa 1950, this building rests on a poured concrete slab and is covered by a front-gabled roof sheathed in v-crimped metal. The roof is supported by a nailed, king-post, truss system made from two-by-fours clad in weatherboard at the gabled ends. Fenestration is limited to the northwest elevation where a single-leaf entry provides access to the building and gabled ends on both the northwest and southeast elevations feature a louvered wood vent at the gable allows warmer air to escape. A small concrete-block pump house covered by a metal-clad shed roof extends from the southeast elevation (Figure 3-126). At the interior, a simple wood work table lines the southwest wall.

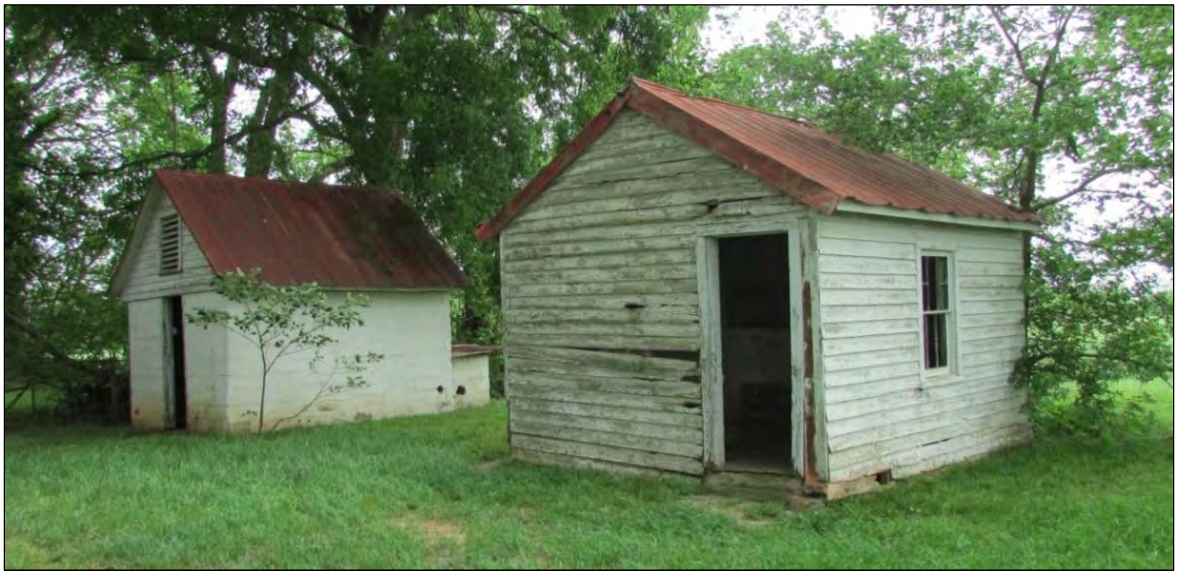

FIGURE 3-125: SLAUGHTER PEN FARM, VIEW OF DOMESTIC OUTBUILDINGS LOOKING NORTHEAST

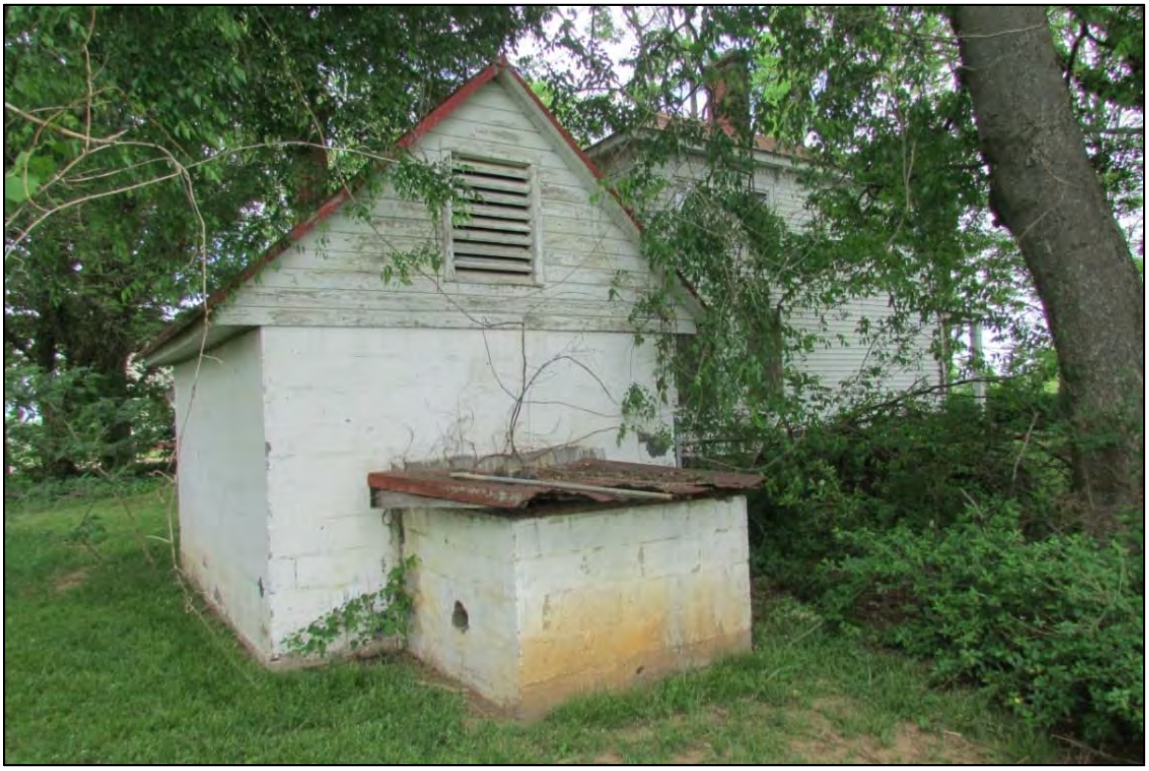

FIGURE 3-126: SLAUGHTER PEN FARM, SOUTH OBLIQUE OF COLD STORAGE SHED

Located closest to the main dwelling is a frame building previously identified as a barn, but which is more accurately described as a granary or storehouse (Figure 3-127). This building appears to have been built circa 1920 and used to store crops and other goods, perhaps for direct sale from the property to area farmers. This building has multiple additions, many of which rest on a continuous poured-concrete foundation and have a frame structural system clad in diagonal plank sheathing. At the two-story, three-bay, original section of the storehouse, this sheathing is further clad in asbestos siding while a large rear addition, likely used to store hay, is sided with corrugated metal. Both of these sections are covered by a front-gabled roof sheathed in v-crimped metal. A single-leaf wood door provides access to the granary from the primary or southeast elevation. A concrete-block addition extends from the east corner of the building and has been modified in recent decades, opening the southeast side to serve as a four-bay machine shed. Another smaller addition extends from the north corner of the building and is covered with overgrowth. It rests on continuous poured concrete, has a frame structural system clad in diamond-shaped asphalt shingles, and is covered by a shed roof. A lean-to porch addition extends from the middle of the southwest elevation to shelter two large loading bays, one of which is covered by a sliding wood door. From the northeast elevation, a window in the foundation lets light into a basement area.

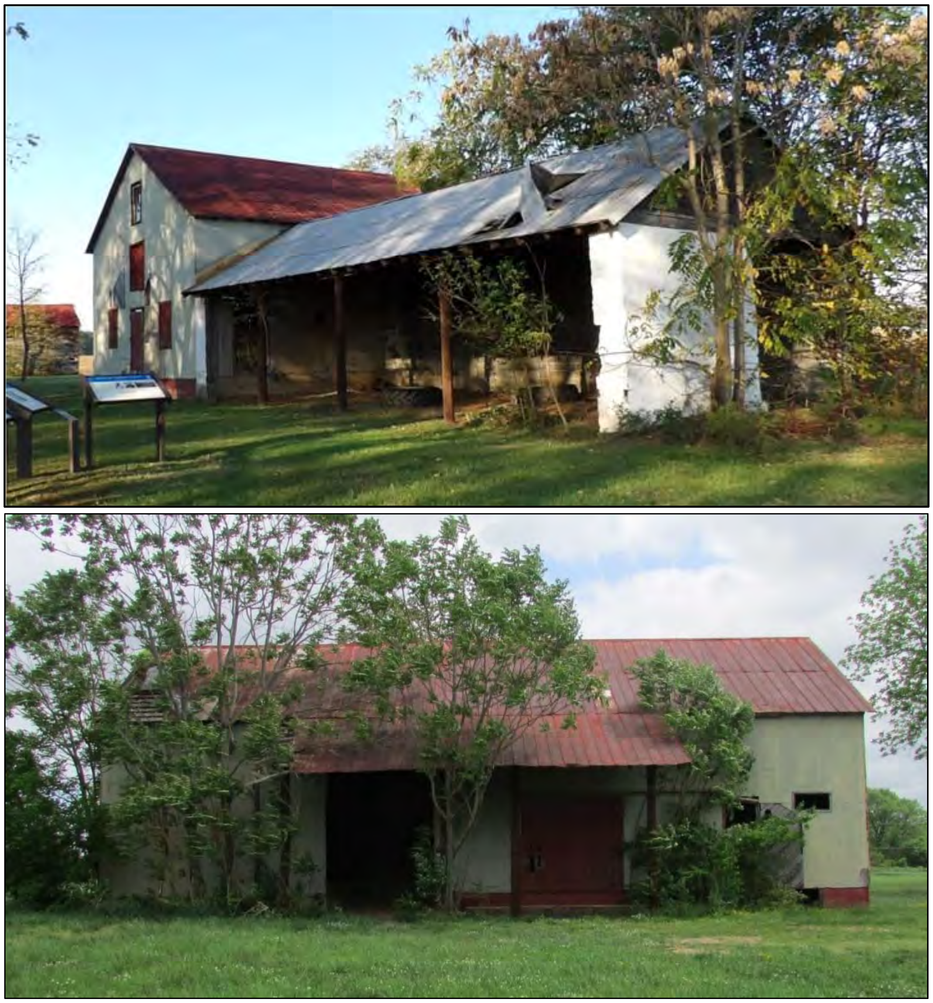

FIGURE 3-127: SLAUGHTER PEN FARM, EAST OBLIQUE OF GRANARY (TOP); SLAUGHTER PEN FARM, SOUTHWEST ELEVATION OF GRANARY (BOTTOM)

A barn previously identified as a "Horse and Wagon Barn," does not appear to have served either in recent decades. The original section of the barn was likely constructed circa 1920. It rests on a continuous poured-concrete foundation and has a balloon-frame structural system clad in weatherboard siding. It is covered by a gambrel roof sheathed in v-crimped metal and features a large hay hood at the southeast elevation (Figure 3-128). At some point in the mid-twentieth-century, the southwest wall of the barn was removed and replaced by a series of metal posts with a poured-concrete floor below and a lean-to addition made that included a feedway for cattle (Figure 3-129). Another lean-to addition was made to the southeast side of this earlier expansion and may have provided a space for machine or wagon storage. A third barn, last surveyed in October 2015, has been recently demolished. This barn appears to have been of pole-type construction and may have been the circa-1900 horse barn mentioned in local court records (City of Fredericksburg Circuit Court 1904). Some of the large poles used to support this barn remained on site, but most of the materials have been removed.

A circa-1894, one-and-a-half-story, tenant house—part of which is log construction—was also noted in local court records (Figure 3-130). Shortly after initial construction, a frame addition was made to the northwest end of the house. Both sides of the house are clad in weatherboard siding and covered by a side-gabled roof sheathed in v-crimped metal. An interior-end brick chimney is partially visible at the southeast end of the house and an exterior-end brick chimney is centrally located on the northwest elevation. The building was covered in overgrowth and could not be closely inspected during the current survey. However, a partial-width, one-story porch was observed across the southwest elevation and is believed to shelter the main entrance. Windows are six-over-six, wood-framed, double-hung sashes throughout the house. A one-story rear ell is located at the north corner while a lean-to addition extends across much of the southeast elevation of the house.

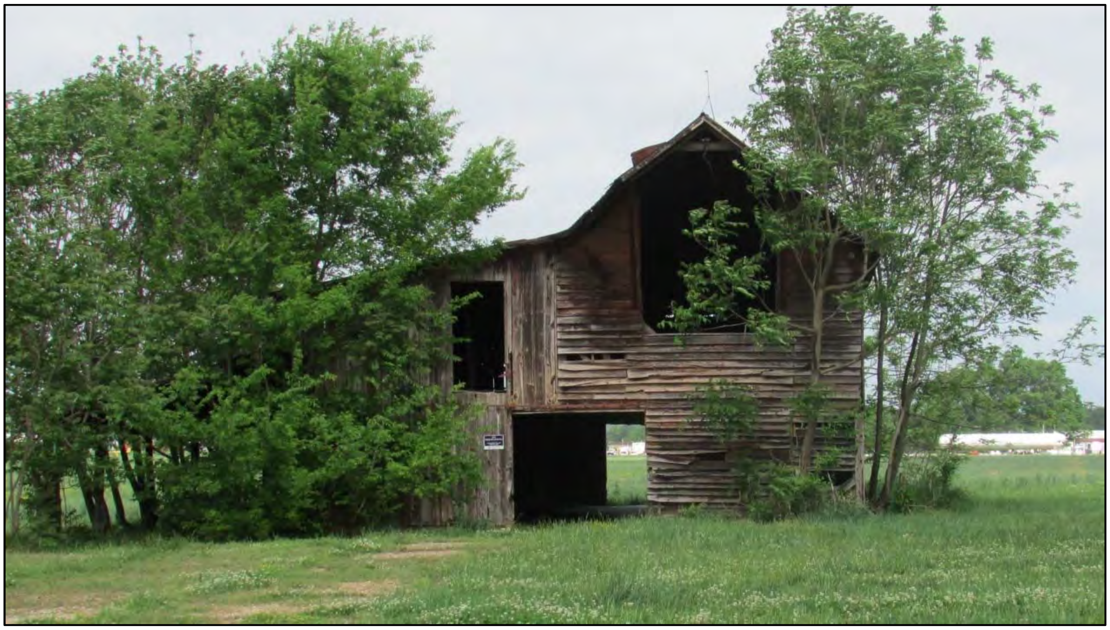

FIGURE 3-128: SLAUGHTER PEN FARM, SOUTHEAST ELEVATION OF BARN

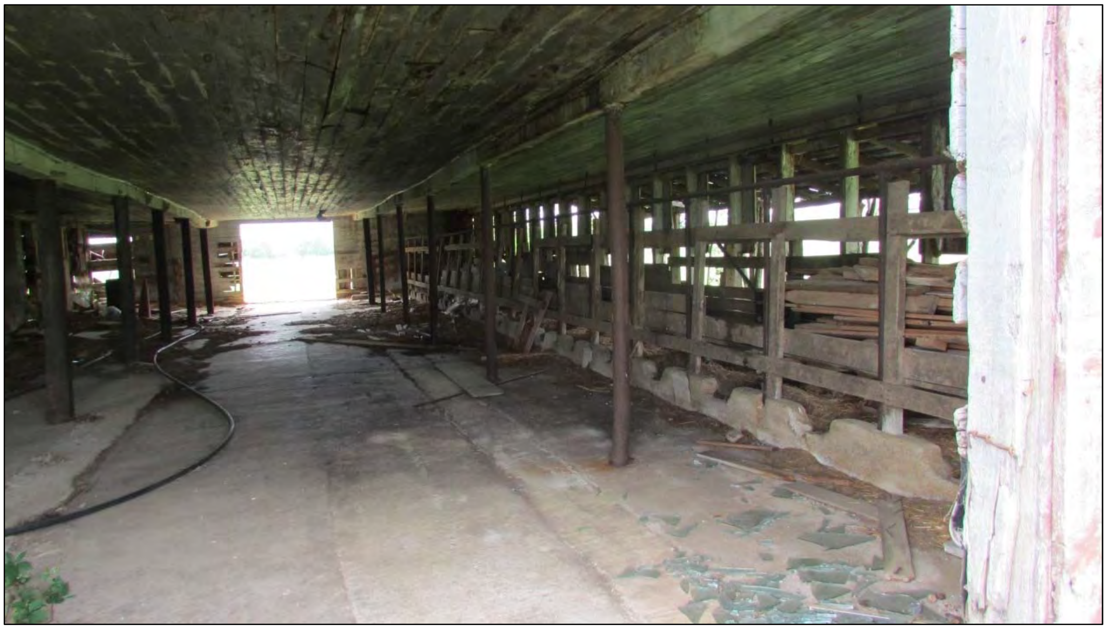

FIGURE 3-129: VIEW OF CENTRAL AISLE AND FEEDWAY AT RIGHT IN BARN LOOKING SOUTHEAST

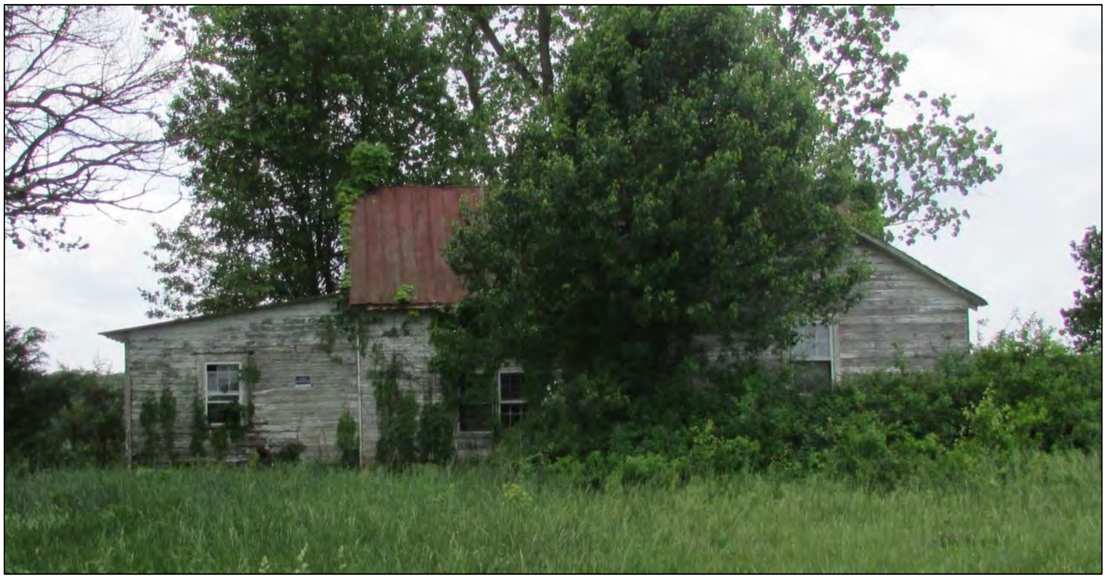

FIGURE 3-130: NORTHEAST OR REAR ELEVATION OF TENANT HOUSE

According to signage posted by the Civil War Trust, a “Virginia Ditch Fence” runs in a northwest-southeast direction across the center of Slaughter Pen Farm (Figure 3-131). This feature predates the Civil War and continues to divide the farms pastures and fields, improving drainage throughout the property. Over time, the ditch has become shallower and narrower, but remains clearly visible from the ground and in historic aerials of the farm. Though few other built features survive from the time of the Civil War at Slaughter Pen Farm, the area remains underdeveloped with many battle viewshed left intact (Figure 3-132).

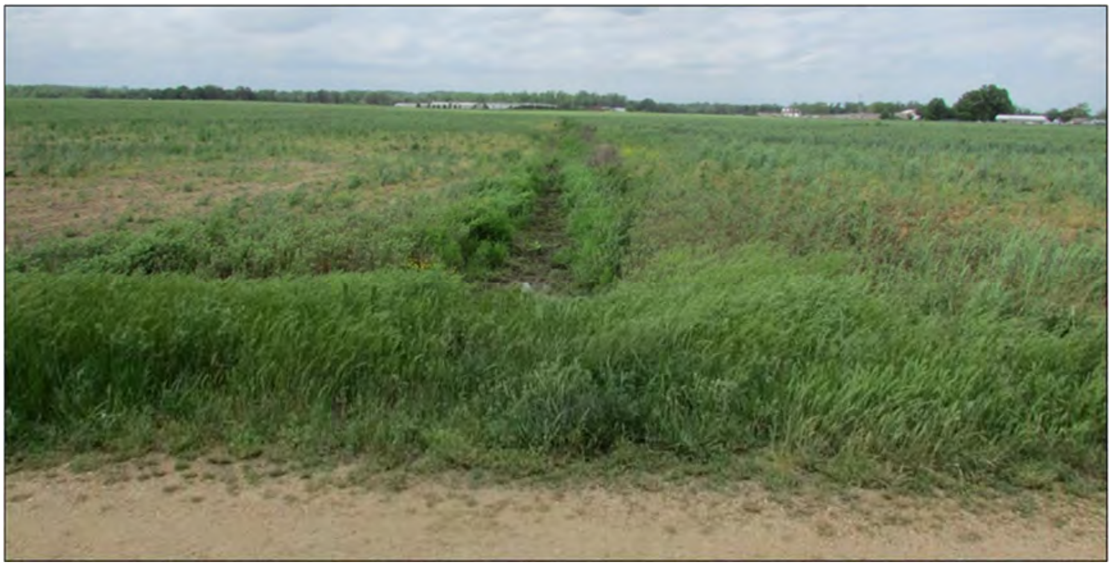

FIGURE 3-131: VIEW OF DITCH FENCE AND FIELDS CROSSED BY GENERAL JOHN GIBBON'S UNION TROOPS DURING THE BATTLE OF FREDERICKSBURG, LOOKING NORTHEAST FROM DRIVEWAY

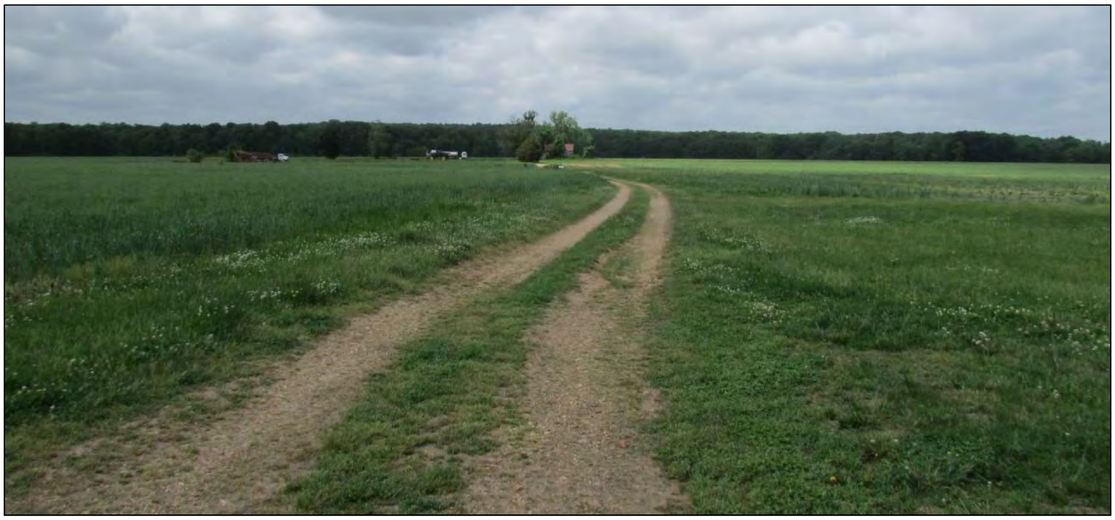

FIGURE 3-132: SLAUGHTER PEN FARM (088-0254), VIEW ACROSS FIELDS TOWARDS RF&P RAILROAD AND JACKSON'S CONFEDERATE TROOPS DURING THE BATTLE OF FREDERICKSBURG, LOOKING SOUTHWEST ALONG DRIVEWAY

3.9.3 NRHP Evaluation

The Slaughter Pen Farm property (088-0254) was the site of a fierce engagement during the Battle of Fredericksburg in December 1862. On December 13th, Federal troops led by Major General William B. Franklin, crossed the property's open fields to attack Confederate defensive positions in the woods just west of the RF&P rail line. Though Federal troops briefly succeeded in breaking through the Confederate line, they were repelled by a counterattack and forced to retreat.

The action at Slaughter Pen Farm was one of the most intense engagements of the Battle of Fredericksburg and the Civil War as a whole. The fighting resulted in more than 5,000 casualties and the awarding of five Congressional Medals of Honor. The Union forces' penetration of the Confederate line, though brief and ultimately repelled, was one of their only successful actions of the entire Battle of Fredericksburg (Civil War Trust 2017).

Though a post-Civil War dwelling and small farm complex were erected on the property, the site retains much of its Civil War-era layout and appearance, and possesses sufficient integrity of setting, feeling, location, and association. For these reasons, the Slaughter Pen Farm property (088-0254) is recommended eligible for listing in the NRHP under Criterion A for its significance and association with the December 1862 Battle of Fredericksburg with a period of significance dating between 1861 and 1865.

The resource has no known associations with any particularly significant people and, therefore, is recommended not eligible for the NRHP under Criteria B. Though the property's circa-1898, Italianate-style primary dwelling remains extant, it has been vacant for a number of years and is in a deteriorating state. These condition issues have impacted the building's integrity of design, materials, and workmanship. Moreover, though the surrounding property retains its rural character, the demolition of associated outbuildings and structures has impacted the dwelling's integrity of setting, feeling and association with regard to its significance as an element of agricultural complex. Lastly, the building does not embody characteristics of a type, period, or method of construction, represent the work of a master, possess high artistic value, or represent a significant and distinguishable entity whose components may lack individual distinction. For these reasons, this resource is recommended not eligible for listing in the NRHP under Criterion C. This property was not evaluated under Criterion D.

In sum, the Slaughter Pen Farm property (088-0254) is **recommended as eligible for listing in the NRHP under Criterion A for its significance and association with the December 1962 Battle of Fredericksburg with a period of significance dating between 1861 and 1865.**

In 2014, DHR staff determined that the resource contributes to the eligibility of the Fredericksburg and Spotsylvania County Battlefields National Military Park Historic District (111-0147). The DC2RVA Team **recommends that it continue to contribute to the historic district.**

The proposed NRHP boundary for the resource at Slaughter Pen Farm at 11232 Tidewater Trail follows the legal lot description for one Spotsylvania County parcel: Parcel Number 25-A-27 (Figure 3-133). It is bounded to the southwest by the current CSXT railroad tracks, to the northwest by a private airport, to the northeast by Tidewater Trail, and to the southeast by several industrial properties. The proposed boundary for Slaughter Pen Farm includes a dwelling, kitchen, shed, granary, barn, Virginia Ditch Fence, and agricultural fields.

3.10 THE CITY OF RICHMOND DEPARTMENT OF PUBLIC WORKS MAINTENANCE YARD (127-6840)

The City of Richmond Department of Public Works Maintenance Yard (127-6840) at 2728 Hermitage Road is located within a predominately industrial area of the city. The resource is currently bounded on the west by the CSXT railroad (historically the RF&P Railroad, 500-0001) and situated south of the Richmond Flying Squirrel baseball stadium and Avenue of Champions (Figures 3-134 through 3-136). This resource was recorded in 2016 as part of the DC2RVA rail identification-level survey. At that time, access to the resource was not obtained and the DC2RVA Team recommended that additional studies would need to be completed in order to gather sufficient data to make an NRHP eligibility evaluation. In a letter dated November 30, 2016, DHR concurred with this recommendation.

In early 2017, this City of Richmond Department of Public Works Maintenance Yard was demolished. The current narrative provides a brief history of the complex and lot followed by photographs of the lot as it currently appears and an updated recommendation on resource eligibility to complete the evaluation process.

3.10.1 Historic Context

Throughout the nineteenth century and the turn of the twentieth century, the area in which the City of Richmond Department of Public Works Maintenance Yard was located was near Henrico County's southern border (Richmond Assessor of Real Estate 2011). Although infrastructure in the county, such as the RF&P Railroad and present-day Hermitage Road, Brook Road, and North Boulevard, were in place by the late 1800s, Richmond's dense development along its northern edge was bounded by Broad and Lombardy streets throughout the first two decades of the 1900s, leaving southern Henrico County relatively rural during this period (Figure 3-137) (United States Geographical Survey [USGS] 1895).

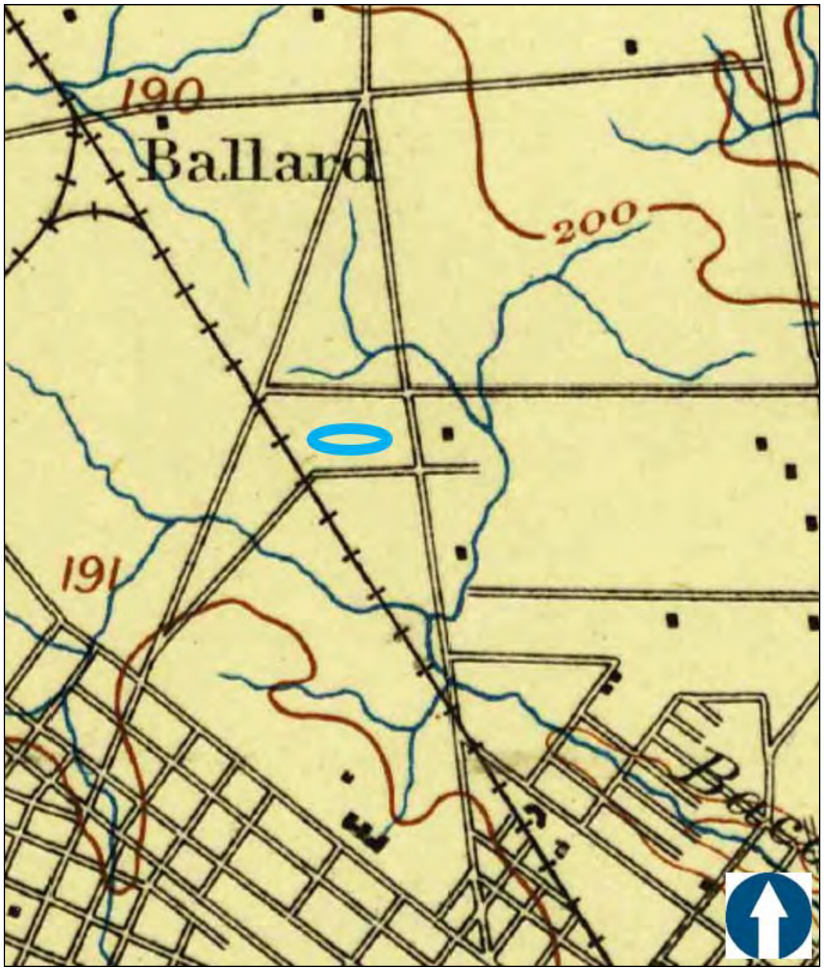

FIGURE 3-137: 1895 USGS 15-MINUTE TOPOGRAPHIC MAP OF RICHMOND, VIRGINIA (USGS 1895). THE APPROXIMATE LOCATION OF THE RICHMOND DEPARTMENT OF PUBLIC WORKS MAINTENANCE YARD IS NOTED IN BLUE. (MAP NOT TO SCALE)

In 1906, the Virginia State Agricultural Society established the Virginia State Fair on a triangular piece of land bounded by the RF&P Railroad, North Boulevard, and Hermitage Road (Figure 3-138) (State Fair of Virginia Records 2017). In addition to the development of railroad spurs and a series of internal roads that provided convenient multi-modal access to the grounds, the owners advertised and contracted outside firms for construction of a race track, grand stand, and a variety of other buildings and structures (Sanborn Map Company 1950; The Times Dispatch 1906a; USGS 1934). For the first time in its new location, the Virginia State Fair captivated audiences from October 9 to October 13, 1906. The owners boasted a new track for horse races and trotting events, a midway complete with amusement features from Coney Island, a hot air balloon, visiting military from other cities and states, parade, a medieval tournament with knights, "The Great Air Ship," which was the "first Air Ship ever brought to Virginia," and a wide variety of exhibits including those on farming machinery, women’s work, dairy products, fruits and vegetables, and livestock (Figure 3-139) (The Times Dispatch 1906a, 1906b, 1906c, 1912).

FIGURE 3-139: ADVERTISEMENT FOR THE 1912 VIRGINIA STATE FAIR (THE TIMES DISPATCH 1912)

Over the next several decades, the State Fair continued to operate in this location and its presence, along with continued advances in streetcars, roadway technology, and automobiles, likely helped spur additional development beyond Broad and Lombardy streets into neighboring Henrico County (Figure 3-140) (USGS 1934). In 1914, the City of Richmond annexed a large swath of land in southern Henrico County primarily populated with early-twentieth-century suburban neighborhoods; this area was also dotted with industrial buildings, especially along the RF&P Railroad, including the Virginia State Fairgrounds at Boulevard (Richmond Assessor of Real Estate 2011).

During the 1930s and 1940s, the City of Richmond constructed a variety of buildings at the southern edge of the fairgrounds, including maintenance garages, auto and truck repair shops, storage buildings, offices, and workshops and the southern end of this group of warehouses is the City of Richmond Department of Public Works Maintenance Yard (Figures 3-141 and 3-142) (Sanborn Map Company 1950, 1952). The State Fair remained in this location on North Boulevard until 1946, when Atlantic Rural Exposition, Inc. relocated the fairgrounds to a new site on Laburnum Avenue in Henrico County (Richmond Times-Dispatch 2009).

Although the State Fair moved from this location, this area in Richmond continued to be a spot for local attraction when, in 1954, a stadium that was built as part of the old fairgrounds was formally repurposed for baseball; it was known as Parker Field (Figure 3-143). In 1985, the baseball complex known as Parker Field was demolished and replaced by the current stadium known as the Diamond, currently the home of the Richmond Flying Squirrels (United Press International, Inc. 1985). The area south and southeast of the baseball complex remains heavily industrial. In 2017, the City of Richmond Department of Public Works Maintenance Yard was demolished.

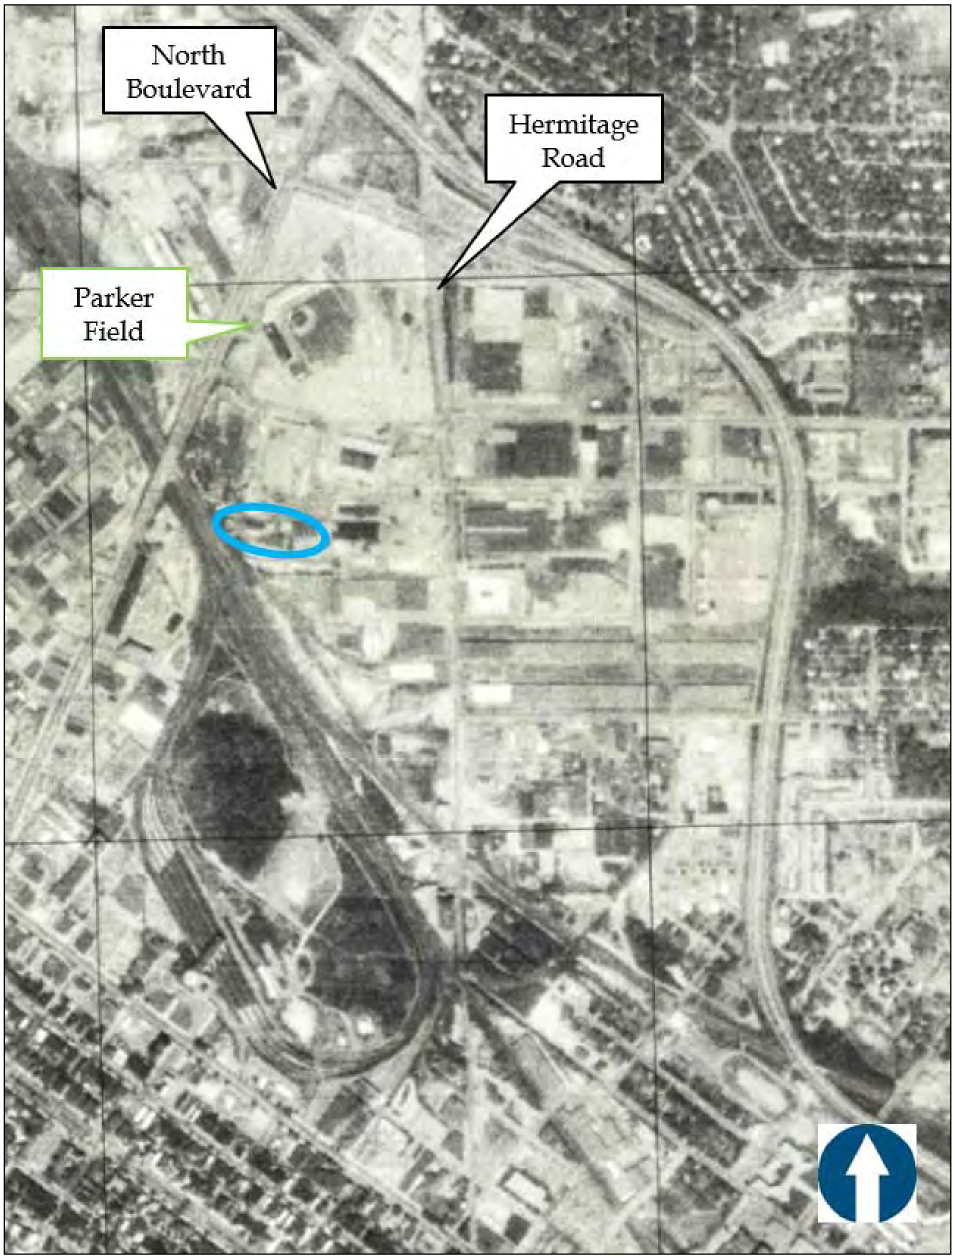

FIGURE 3-143: 1974 AERIAL MAP (RIGHT) (USGS 1974). THE CITY OF RICHMOND DEPARTMENT OF PUBLIC WORKS MAINTENANCE YARD IS NOTED IN BLUE. (MAPS NOT TO SCALE)

3.10.2 Architectural Description

City of Richmond Department of Public Works Maintenance Yard once comprised an office, workshop, auto repair shop, and a machine shed. In early 2017, this resource, including all buildings, parking lots, roads, and other infrastructure, was demolished. Today, the lot is covered in grass; no above-ground elements remain of the once-extant complex (see Figure 3-134).

3.10.3 NRHP Evaluation

The City of Richmond Department of Public Works Maintenance Yard at 2728 Hermitage Road was an industrial complex associated with machine and auto repair. It was demolished in early 2017, resulting in a complete loss of historic integrity. As such, the City of Richmond Department of Public Works Maintenance Yard is **recommended not eligible for the NRHP under Criteria A–C.** It was not evaluated under Criterion D; however, photographs taken of the demolition show notable subsurface disturbances completed during the demolition process. The probability for encountering intact, significant archaeological deposits is low.

3.11 CHESAPEAKE & OHIO RAILROAD SEGMENT (127-6793)

The Chesapeake and Ohio Railroad Segment (C&O Railroad Segment) (127-6793), the currently documented segment of a much larger railroad system, runs from the Shockoe Valley area of downtown Richmond near North 20th Street, westward along the northern bank of the James River and ending at Powhite Parkway (Route 76) (Figure 3-144).

3.11.1 Historic Context

The C&O Railroad Segment was a private railroad designed to connect the Tidewater region of Virginia with the Ohio River, a major water transportation route in the west. However, the railroad did not begin with such wide-reaching goals in mind; instead, it began with a small, local railroad linking the citizens of Louisa County with commercial opportunities in Richmond.

Following the successful chartering of the RF&P Railroad (500-0001) in 1834, citizens in Louisa County, Virginia, were eager to establish their own railroad connection between their farm markets and the large consumer base of Richmond. In 1836, after approximately a year of surveying, a group of interested county residents petitioned the General Assembly to charter the Louisa Railroad Company to build a line of track from Doswell to Gordonsville (Turner 1975). Rather than connecting directly with Richmond, the company decided to pay the RF&P Railroad in passenger and freight returns for the use of their newly constructed track between Doswell and Richmond. Progress was slow but steady, reaching Louisa Court House in December 1838 and Gordonsville on January 1, 1840. Throughout the 1840s, construction slowed drastically as an economic slump and legal battles with the RF&P Railroad hampered the company's efforts to independently connect with Richmond and Charlottesville. It took until 1850 for the railroad to connect independently to Richmond, but it celebrated its new range by renaming itself the Virginia Central Railroad (Figure 3-145).

The Virginia Central Railroad continued to push westwards across the Blue Ridge Mountains throughout the 1850s. To help the railroad's efforts, the Commonwealth chartered the Blue Ridge Railroad specifically to handle construction across the mountain range while the Virginia Central worked west across the Shenandoah Valley to the Allegheny Mountains. The Commonwealth chartered a second railroad, the Covington and Ohio Railroad, to work across the Alleghenies but work was suspended during the Civil War. The Virginia Central Railroad was used to transport supplies, food, and occasionally troops for the Confederacy and as a result suffered significant damage at the hands of Union forces in both the Shenandoah Valley and around Richmond. By 1865, the railroad was left virtually bankrupt with only 5 miles of usable track left (Chesapeake and Ohio Historical Society 2016). Desperate to remain solvent, the Virginia Central Railroad courted Northern and foreign interests and eventually tempted railroad magnate Collis P. Huntington to purchase a majority interest in the company. Huntington wanted to establish a transcontinental railroad that would stretch from the Atlantic to the Pacific and felt that the Virginia Central and Covington and Ohio lines would be the perfect eastern section of his railroad. He financed the railroad as far as the Ohio River and, in recognition of the new extent of the line, renamed the railroad the C&O Railroad.

FIGURE 3-145: CIRCA-1860 MAP OF VIRGINIA CENTRAL WEST OF THE BLUE RIDGE MOUNTAINS (CITTI CA. 1860)

The C&O Railroad was hit hard during the financial depression of 1873 and went into receivership in 1878, eventually reorganizing into the C&O Railway Company. Fortunately for the company, the majority of its most recently constructed track cut directly though West Virginia coal country and throughout the 1880s, the C&O Railroad was able to regain its financial security by shipping huge quantities of bituminous coal back east, especially to the port in Newport News along the historic Virginia Central Railroad track through Richmond. In 1889, the C&O Railroad merged with the Richmond & Alleghany Railroad, a descendent of the James River & Kanawha Canal, to open a shallower-graded route from the base of the Alleghany Mountains down to Richmond and make shipping coal even more efficient.

More mergers and expansions from the 1890s to the 1920s opened up lines to Kentucky, Chicago, Cincinnati, Columbus, and numerous other cities throughout Ohio (Dixon and Griffin 2010). Even during the Great Depression, the C&O Railroad remained a healthy company and was even able to rebuild existing infrastructure and pursue new construction projects, based almost entirely on its coal trade (Figure 3-146) (Chesapeake and Ohio Historical Society 2016). With its newly renovated resources, the railroad thrived during the transportation boom of World War II and carried its success into the post-war years.

Because the railroad had actually grown during the Great Depression years and carried that momentum through the 1940s, the C&O Railroad was especially well-placed to lead the advance in railroad technology. To encourage ridership and track development, the company established the slogan "Sleep Like a Kitten and Arrive Fresh as a Daisy in Air-Conditioned Comfort" (Chesapeake and Ohio Historical Society 2017). The C&O Railway Company was the first railroad company to use a large-scale computer system, was one of the early adopters of diesel power, and worked to diversify its traffic, giving the company greater financial security and allowing it to challenge trucking for freight service.

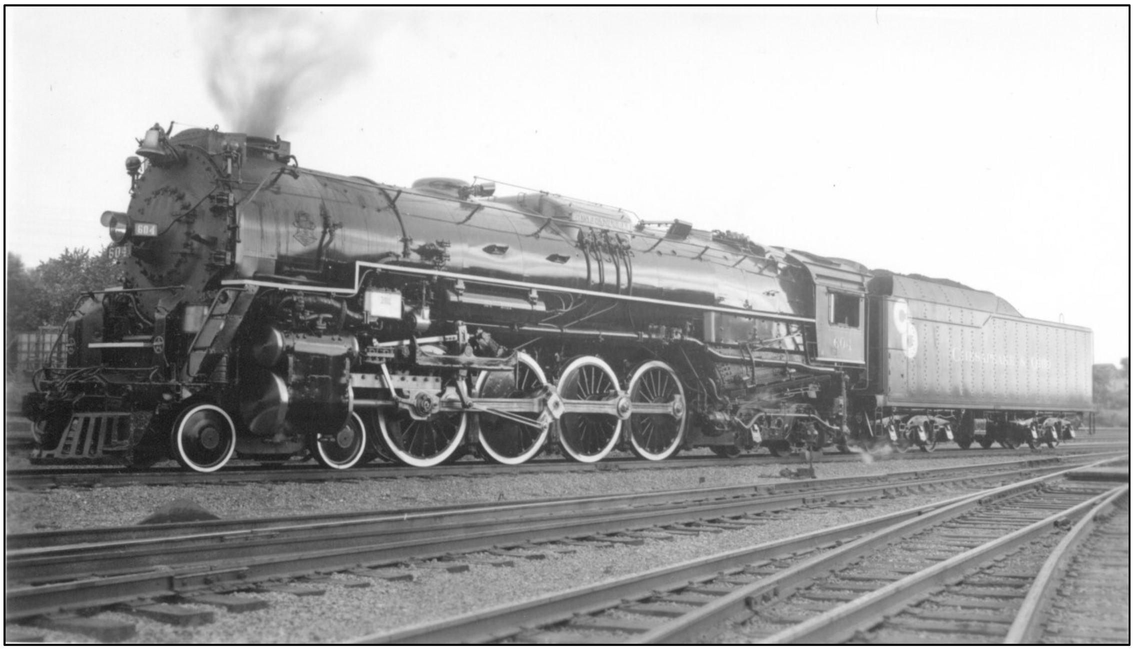

FIGURE 3-146: THE NEW C&O LOCOMOTIVE "EDWARD RANDOLPH" BEFORE GOING INTO SERVICE, 1935. THE C&O WAS ABLE TO PURCHASE AND REFURBISH ROLLING STOCK AND INFRASTRUCTURE THROUGHOUT THE 1930S AND 1940S. (SHORPY.COM 2017)

In the 1960s, the C&O Railway Company was still gaining in power and prestige and began to merge with larger railroads like the Baltimore & Ohio. In 1972, the C&O Railway Company merged with the Baltimore & Ohio Railroad and the Western Maryland Railroad to become Chessie Systems. Eight years later, Chessie Systems merged once again, this time with Seaboard Coast Line Industries, under the name CSXT. CSXT continues to operate as a freight line and is one of the most dominant rail companies east of the Mississippi (Figure 3-147).

FIGURE 3-147: CSXT ENGINE AND ROLLING STOCK, CIRCA-1980 (CSXT 2017)

3.11.2 Architectural Description

The C&O Railroad Segment first began as a local spur connecting Louisa County, Virginia, with the RF&P Railroad and its Richmond terminal. Over the course of nearly two centuries, the railroad grew to encompass a line stretching from Norfolk, Virginia in the east to the Mississippi River in the west and Lakes Huron and Michigan in the north. A majority of its line runs east-to-west, moving through Richmond and working its way through several large cities like Charlottesville, Virginia; Charleston and Huntington, West Virginia; and Lexington and Louisville, Kentucky. Three main north-south routes branch off the line: the eastern-most connects the western end of the original Louisa-Richmond line with Washington, D.C.; the central line runs from Huntington, West Virginia up through Columbus and Toledo, Ohio into Michigan; and the western line passes through Cincinnati, Ohio and terminates in Chicago, Illinois. Numerous smaller lines branch off the main lines throughout the system, although this is more prevalent throughout West Virginia and Ohio than along the oldest sections around Richmond. Current survey was limited to the rail line within the RF&P Railroad corridor.

In the Richmond area, the C&O Railroad Segment consists of two lanes of elevated track along the northern embankment of the James River, within the city's flood wall (Figure 3-148). The tracks sit on a steel-plate, deck girder structure that is connected with rivets and bolt repairs. The girders sit on a variety of support members from reinforced concrete or steel bents with rounded ends supported by paired, square, poured concrete piers, steel I-beam piers with varied transverse bracing and longitudinal cross bracing. A few places along the rail line, a metal grated pedestrian walkway with metal roping is along an elevation (Figure 3-149).

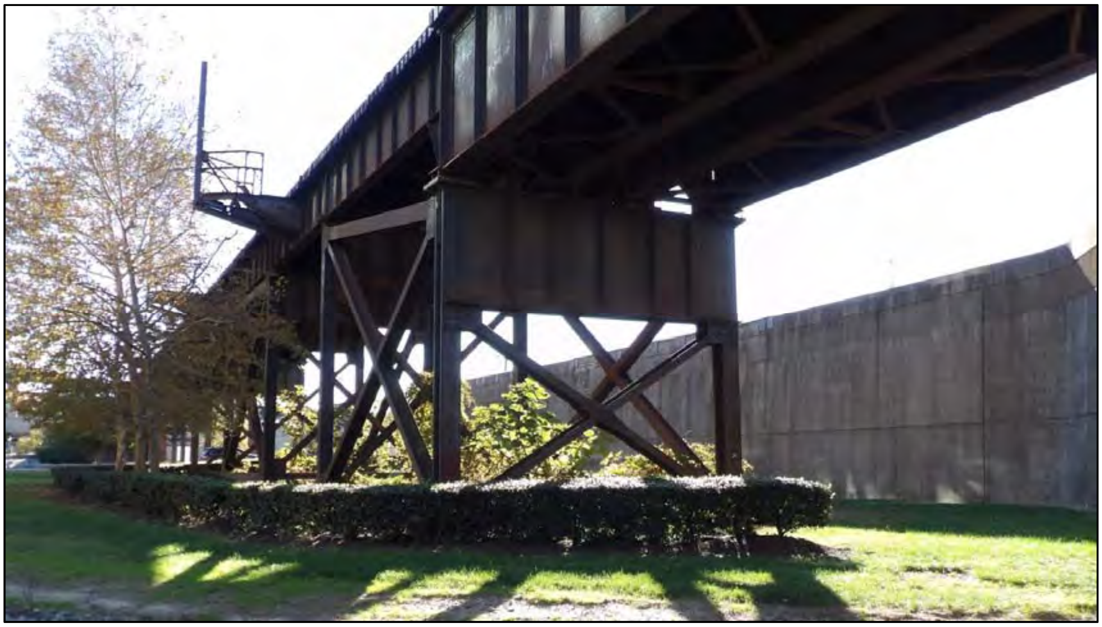

FIGURE 3-148: A C&O ELEVATED STEEL-PLATE-GIRDER BRIDGE AT SOUTH 14TH STREET, RICHMOND, VA, LOOKING SOUTHWEST

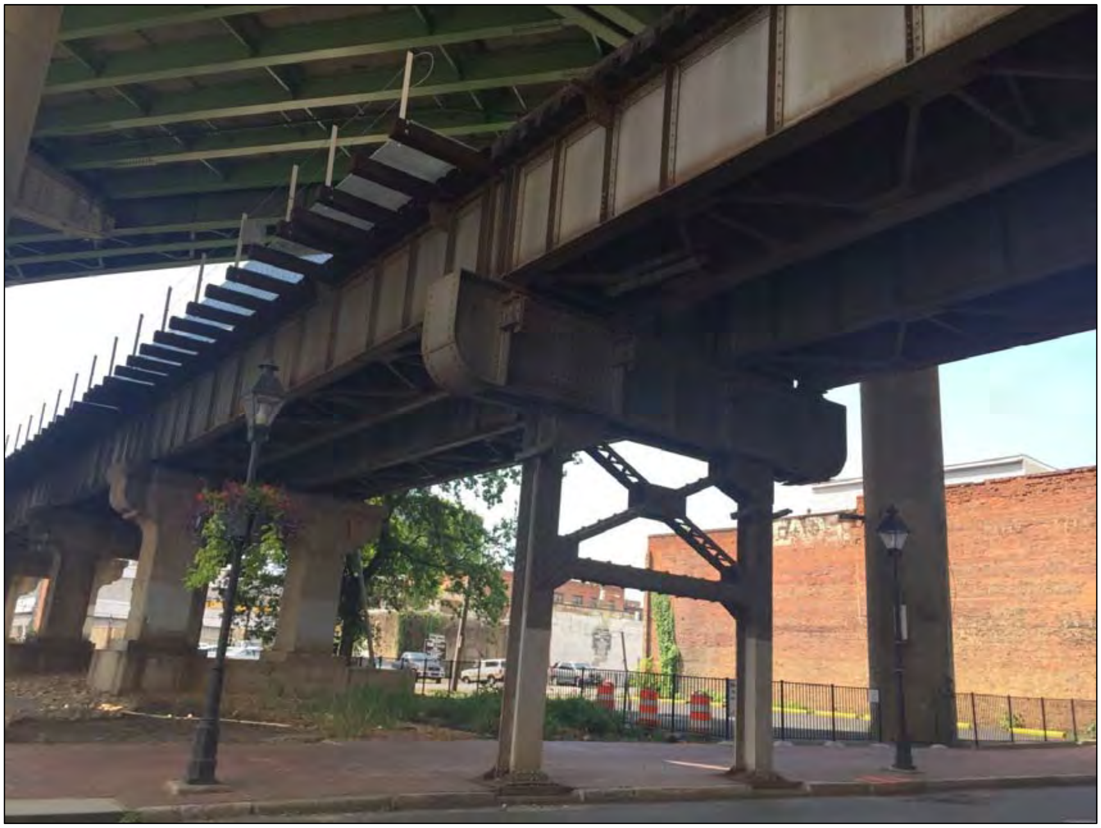

FIGURE 3-149: ELEVATED SUBSTRUCTURE OF THE RAIL LINE IN RICHMOND, LOOKING WEST FROM THE VIRGINIA CAPITAL TRAIL

3.11.3 NRHP Evaluation

The C&O Railroad Segment (127-6793) was first established in 1836 as the Louisa Railroad to connect Louisa County with the town of Doswell and the RF&P Railroad. With the notable exception of the Civil War years (1861–1865) and their immediate successors, the nineteenth and twentieth centuries were a time of consistent growth for the company, both in terms of its net worth and its material assets. The C&O increased their track mileage through independent construction projects and savvy mergers with other railroads in mid-Atlantic region.

As the company grew over a long period of time and incorporated assets from numerous other companies, most of the railroad's resources, when taken as a whole, are heterogeneous in style and form. However, specific areas within the overall system, like the original corridor between Louisa and Richmond, often display similarities in form, materials, style, and feeling as they were typically built and renovated in the same time period.

The historic C&O Railroad Segment corridor has been surveyed in parts on several occasions within the Richmond vicinity. It was a significant transportation resource throughout the eastern United States and remains an active force in the region as part of CSXT. It was especially important in the development of a strong transportation network in central Virginia as a whole and in the Richmond area specifically. Therefore, it is recommended that the C&O Railroad Segment is eligible for listing in the NRHP under Criterion A for its association with Transportation at the regional level.

It has no known association with any individuals of historical significance and is therefore recommended not eligible for listing in the NRHP under Criterion B. The railroad corridor has undergone numerous changes throughout its history, primarily related to general, routine maintenance practices; this did result in the updating or replacement of most of its materials. This diminished the railroad's integrity of materials and workmanship resulting in it being recommended not eligible for listing in the NRHP under Criterion C. As an architectural resource, it was not evaluated under Criterion D.

In sum, the C&O Railroad Segment is **recommended eligible for listing in the NRHP under Criterion A for Transportation**.

The proposed NRHP boundaries follow the historic C&O Railroad Segment line as outlined in the architectural reconnaissance survey of structures for the DC2RVA Project (Figure 3-150) (Chase 2017). It begins in the Shockoe Valley area of the City of Richmond approximately 1,000 feet east of Interstate 95 and runs westward along the north embankment of the James River to the Powhite Parkway. The period of significance for the C&O Railroad Segment begins in 1865, when the many smaller rail lines linked and became the C&O Railroad and extends to 1968. This end date follows the NPS guidelines which say: "Fifty years ago is used as the closing date for periods of significance where activities begun historically continued to have importance and no more specific date can be defined to end the historic period" (NPS 1997).

3.12 SOUTHERN RAILWAY SEGMENT (127-6792)

The Southern Railway Segment (127-6792), a short segment of a much larger railroad system, runs along the south end of the Shockhoe Bottom area of Richmond, Virginia, adjacent to the James River and then crosses the river, traveling southwest along the railroad tracks west of the Mayo Bridge (127-5808; 127-5809). The railway then follows the southern embankment along the river to the Powhite Parkway (Route 76) (Figure 3-151).

3.12.1 Historic Context

The Southern Railway Company was formed by the consolidation of six southern railroads, the largest of which was the R&D Railroad Company in 1894 (Southern Railway Historical Association 2017). Its earliest predecessor line, however, was the South Carolina Canal & Rail Road Company in South Carolina, chartered in 1827. The R&D Railroad, chartered in 1847, connected Richmond to the City of Danville, located just above the Virginia/North Carolina border, and opened in 1856 on a 5-foot-wide, broad-gauge system (Figure 3-152) (American-rails.com 2017a; Langley Jr. 2010:4). The R&D Railroad played an important role in the Civil War, connecting Richmond with the rest of the Confederacy, but it suffered some damage including burned bridges during the fighting around Richmond (Figure 3-153). After repairing wartime damages, the R&D Railroad began to expand its territory by acquiring small, local railroads, such as the Orange and Alexandria Railroad (O&A Railroad) and connecting them to their existing lines (Figure 3-154). Although most of their initial growth occurred in Virginia, the railroad tried to become a Southern regional carrier by branching out of Virginia into North Carolina. The line was connected to Greensboro, North Carolina, by 1864 via the Piedmont Railroad and in 1873 the system served Atlanta through the Piedmont Air-Line (American-rails.com 2017a).

The growth of the R&D Railroad was severely limited by a caveat in the original charter that only allowed the railroad to control lines to which it was already connected. To get around this issue, the R&D Railroad helped form the Richmond & West Point Terminal Railway and Warehouse Company in 1880. As a separate organization, the Terminal Railway could acquire any company they desired. The Terminal Railway began by assuming control of the R&D Railroad through stock ownership and then acquired numerous local lines to lease to the R&D Railroad, thus increasing their practical holdings without violating their charter (Langley Jr. 2010:4). In 1882, the R&D Railroad began operating along with five other, smaller local companies as the Piedmont Air-Line System (Figure 3-155); the Terminal Company continued to manage the R&D Railroad throughout this era.

FIGURE 3-155: AN ADVERTISEMENT FOR THE PIEDMONT AIR-LINE SYSTEM, 1882 (CHATAIGNE 1882)

The Terminal Company suffered from chronic mismanagement and was on the verge of bankruptcy in 1892; the Company opened negotiations with John Pierpont Morgan that year to take control of the company. Negotiations lasted for two years but finally led to Morgan receiving full control of the Terminal Company in *1894* (Harrison 1901). He promptly disbanded it and all of its affiliated railroads and formed the Southern Railway Company using the existing infrastructure; the R&D Railroad alone contributed over 1,500 miles of track to the new company. The Southern Railway Segment, known as one of the "Big Three" rail lines, began in Richmond, southwesterly through the Carolinas, and later further south through Atlanta, Birmingham, Columbus, Meridian, and New Orleans (Langley Jr. 2010:3). It then expanded further acquiring rail lines to reach Asheville, Chattanooga, Cincinnati, Knoxville, Lexington, Louisville, Memphis, Norfolk, and St. Louis (Figure 3-156). In 1895, Southern Railway Company purchased the Atlanta & Florida Railway; a year later, leased the Georgia Midland Railway. In 1899, Southern Railway controlled the South Carolina & Georgia Railroad along with the Augusta Southern Railway (Storey 2017). Samuel Spencer served as president of Southern Railway Company from 1894 to is death in 1906; during that time, 3,000 miles rail lines had been added and 68 railroad entities and their over 100 charters were assimilated into the company (Langley Jr. 2010:18).

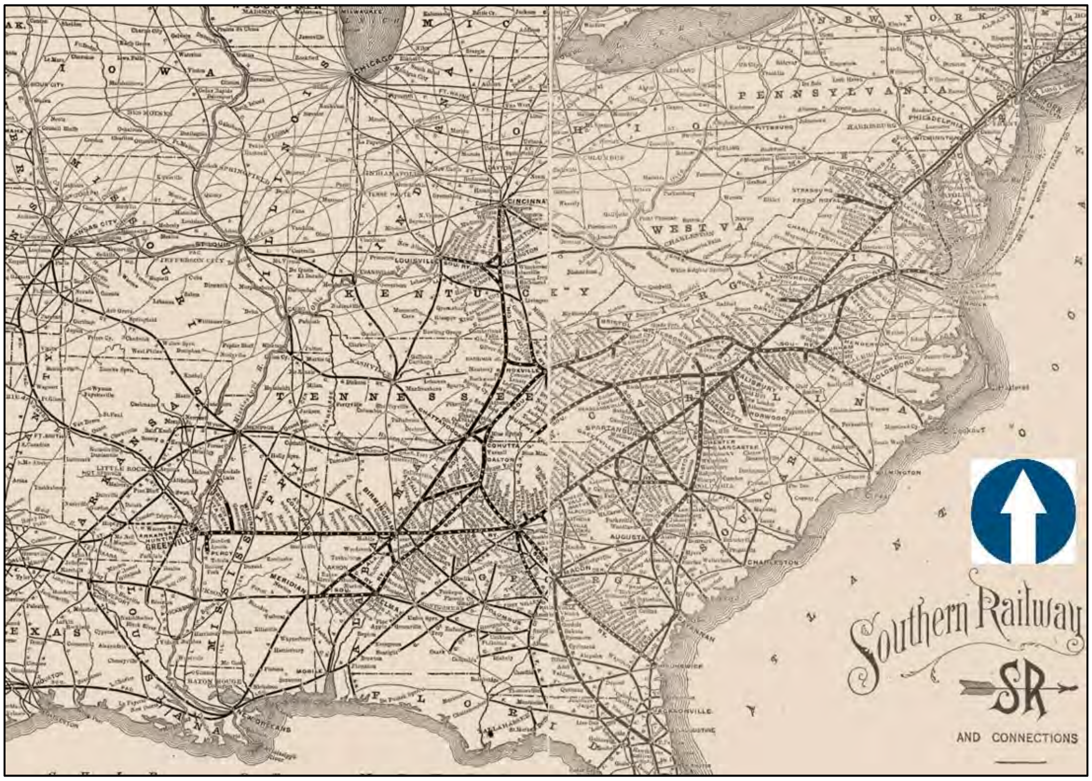

FIGURE 3-156: MAP OF THE SOUTHERN RAILWAY AND ITS CONNECTIONS, 1896 (NATIONAL RAILWAY PUBLICATION COMPANY 1896) (MAP NOT TO SCALE)

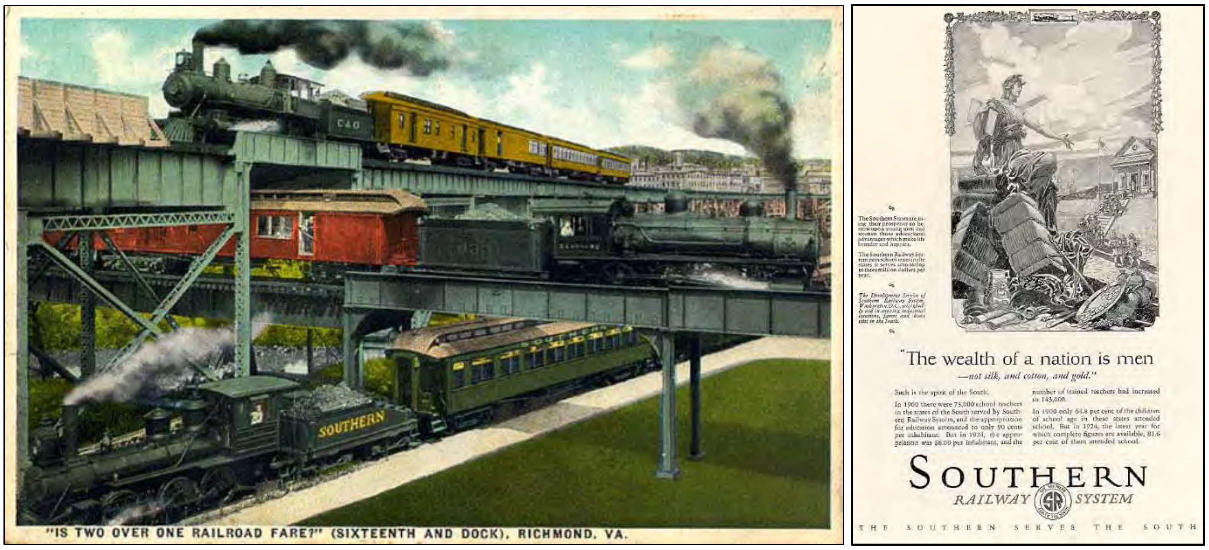
The Southern Railway Company flourished throughout the 1900s and early 1910s (Figure 3-157). However, the outbreak of World War I in 1914 virtually eliminated the European market for southern-produced goods and drastically reduced the railroad's freight traffic until the U.S. entered the war in 1917 (Langley Jr. 2010). Following the cessation of hostilities, the railroad continued to expand its holdings and improve infrastructure until the 1929 stock market crash (Figure 3-158). The company was able to secure loans that kept them afloat during the Great

Depression but these loans put the company deeply in debt. Throughout the 1930s, the Southern Railway Company remained on tenuous ground as the Great Depression kept profits low and their loan debt mounted.



C&O
SOUTHERN
"IS TWO OVER ONE RAILROAD FARE?" (SIXTEENTH AND DOCK), RICHMOND, VA.

The Southern States are using their prosperity to bestow upon young men and women those educational advantages which make life broader and happier.

The Southern Railway System pays school taxes in the states it serves amounting to three million dollars per year.

The Development Service of Southern Railway System, Washington, D.C., will gladly aid in securing industrial locations, farms and home sites in the South.

"The wealth of a nation is men

—not silk, and cotton, and gold."

Such is the spirit of the South.

In 1900 there were 73,000 school teachers in the states of the South served by Southern Railway System, and the appropriation for education amounted to only 90 cents per inhabitant. But in 1924, the appropriation was $8.00 per inhabitant, and the number of trained teachers had increased to 143,000.

In 1900 only 64.8 per cent of the children of school age in these states attended school. But in 1924, the latest year for which complete figures are available, 81.6 per cent of them attended school.

FIGURE 3-158: SOUTHERN RAILWAY COMPANY SYSTEM MAP, 1921 (SOUTHERN.RAILFAN.NET 2005) (MAP NOT TO SCALE)

With the outbreak of World War II in Europe in 1939, the Southern Railway Segment saw an uptick in traffic as lend-lease material production stimulated the economy and increased the need for freight shipping. When America entered the war in 1941, the Southern Railway Segment serviced the huge numbers of training camps that appeared in the south and transported troops and supplies to embarkation areas. The company also assisted the government in training soldiers to operate rail lines overseas (Langley Jr. 2010:22).

Following the war, the company continued to expand, although only within the South (Figures 3-159 and 3-160). In 1963, it purchased the Central of Georgia Railway and the Georgia & Florida Rail line (Storey 2017). Three years later, they purchased Georgia Northern and the Albany & Northern Rail lines; in 1971 they acquired the Tennessee, Alabama & Georgia Railway. As its competition diversified their holdings throughout the 1960s and 1970s, mainly through mergers, the Southern Railway Company began a series of ultimately unsuccessful attempts to establish independent service into Chicago and points further west. In 1980, Chessie System, Inc. and Seaboard Coast Line Industries merged to form CSXT, which rapidly became one of the most dominant railroad companies in the East. Later that year, Southern Railway began merger negotiations with the Norfolk & Western Railway Company in an attempt to remain competitive with CSXT. In 1982, the new Norfolk Southern Corporation began operations throughout the eastern United States, serving markets from Florida to New York to Missouri and continues to use the line.

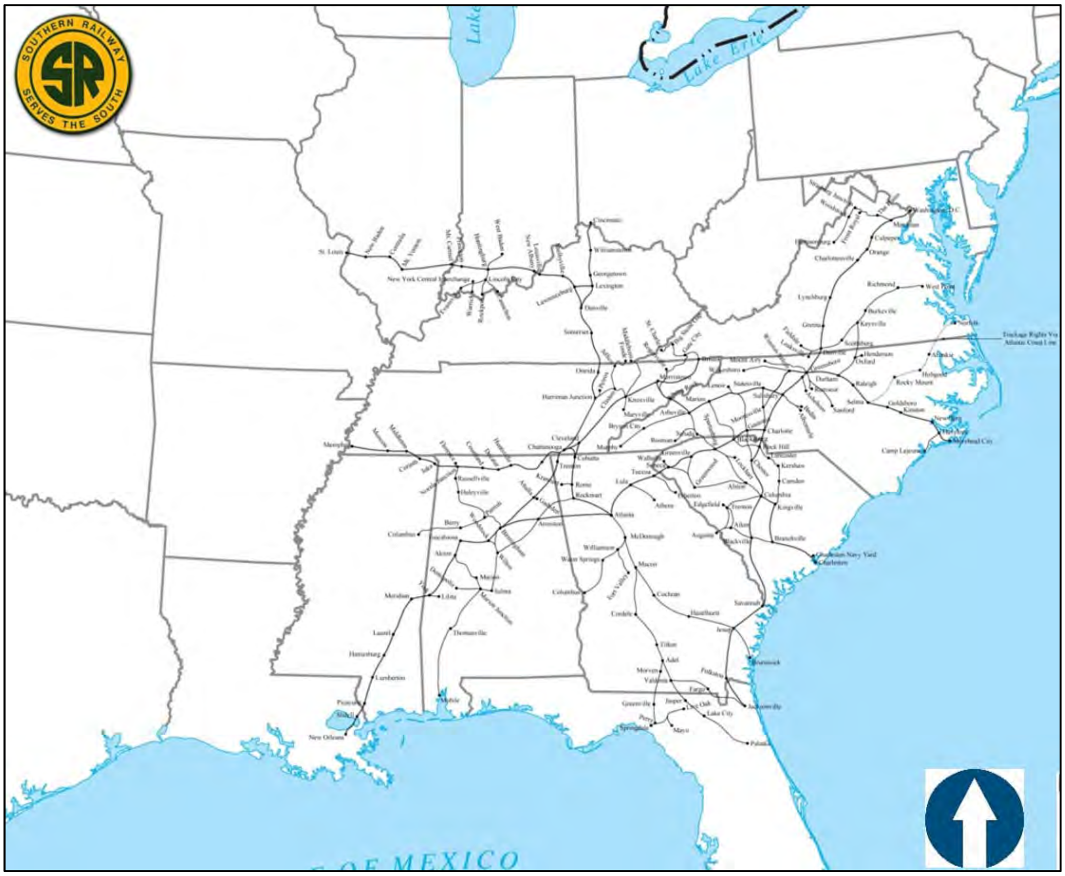

FIGURE 3-159: A 1962 MAP OF THE SOUTHERN RAILWAY COMPANY'S NETWORK (AMERICAN-RAILS.COM 2017A) (MAP NOT TO SCALE)

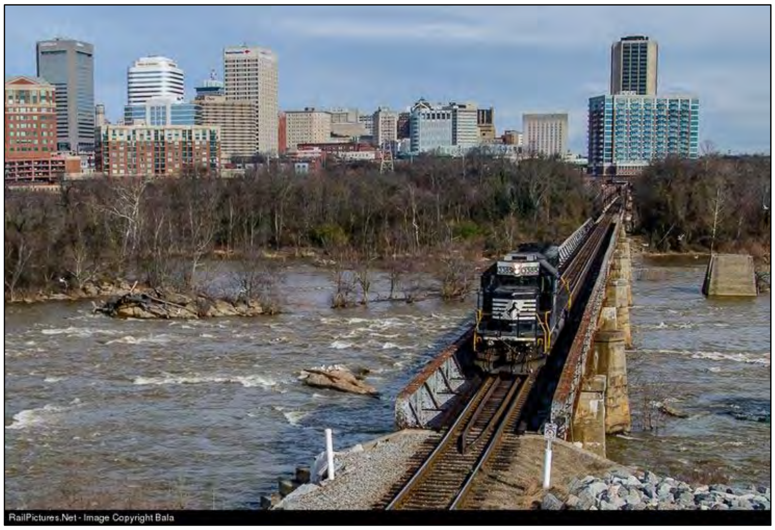

FIGURE 3-160: NORFOLK SOUTHERN TRAIN CROSSES THE JAMES RIVER SOUTH OF RICHMOND, VIRGINIA (RAILPICTURES.NET 2016:562087)

3.12.2 Architectural Description

The Southern Railway Company grew from several small, local railroads chartered in the 1840s and 1850s, most notably the R&D Railroad (1847) which ran from Richmond to Danville along the North Carolina border. While the railroad eventually operated throughout the southeast, the historic R&D line and the many smaller railroads it operated in Virginia and North Carolina formed the Railway's core. As the Southern Railway Segment stemmed from numerous regional railroads, it featured a wide variety of engineered rail lines and associated structures such as signals, towers, stations, tunnels, yards, culverts, and bridges. The surveyed portion of the rail line extends from the Triple Crossing in Richmond near the Riverfront Canal Walk, south over the James River, on the edge of a former Atlantic Coast Line Railroad (ACL) Shops Yard, crossing under the Manchester Bridge (9th Street Bridge, 127-0240) and the Robert E. Lee Bridge (Route 301, 127-0366). It then runs along the northern edge of suburban residential housing, passing under the Boulevard Bridge (Westover Hills Boulevard, 127-5147) and the Richmond Railway Bridge (44HE0840) before turning south along the east side of Powhite Parkway (Route 76) and terminating at the intersection of Powhite Parkway and Forest Hill Avenue.

From the Triple Crossing, the rail line is carried across the James River by a steel-plate, half-through (pony) girder, railroad bridge with poured concrete piers, a through truss bridge, and crosses under the city's flood walls (Figure 3-161). Just south of the flood wall, is a steel-plate deck girder that carries the rail line over a low-lying area. The rail line contains one track that joins with additional track on the river's southern embankment through the former ACL Railroad Shops Yard (Figure 3-162) (Hawkins 2011). Once past Cowardin Avenue (Route 1), Southern Railway runs westward with two tracks, parallel to the James River Bike Path and returns to one track near Hillcrest Circle.

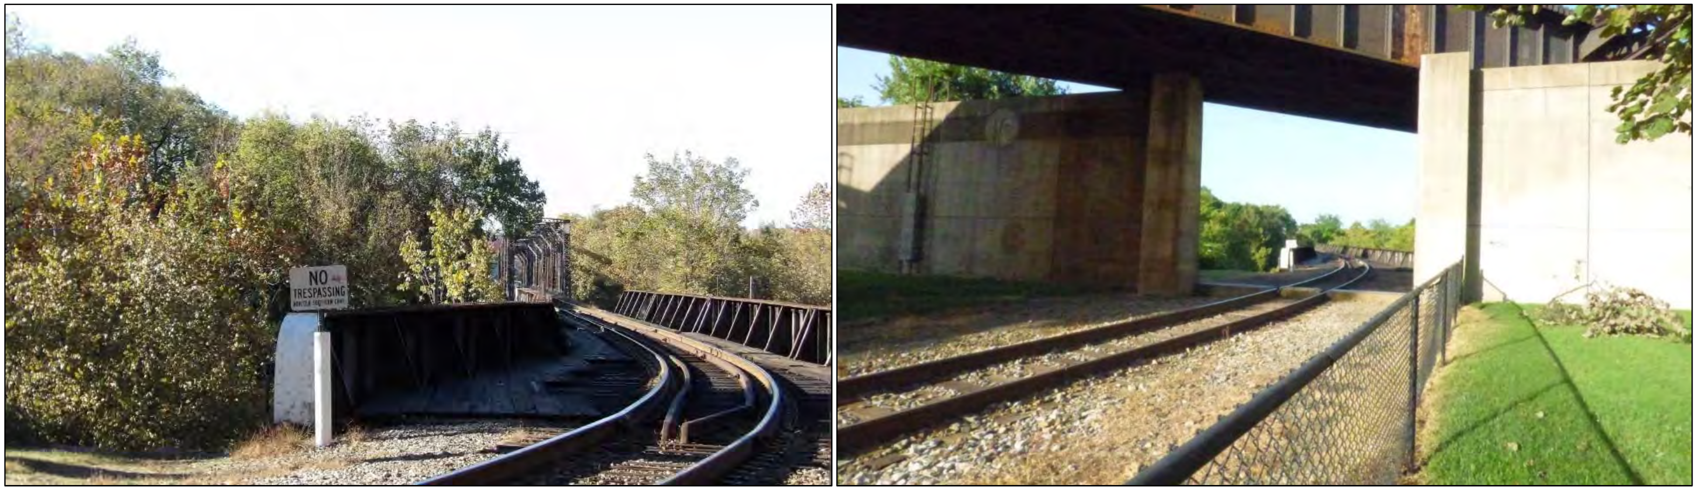

FIGURE 3-161: NORFOLK-SOUTHERN RAILROAD STEEL-PLATE PONY TRUSS BRIDGE IN RICHMOND, LOOKING SOUTHWEST TOWARD A THROUGH TRUSS (LEFT); VIEW OF SOUTHERN RAILWAY SEGMENT'S ONE TRACK, LOOKING SOUTHWEST (RIGHT)

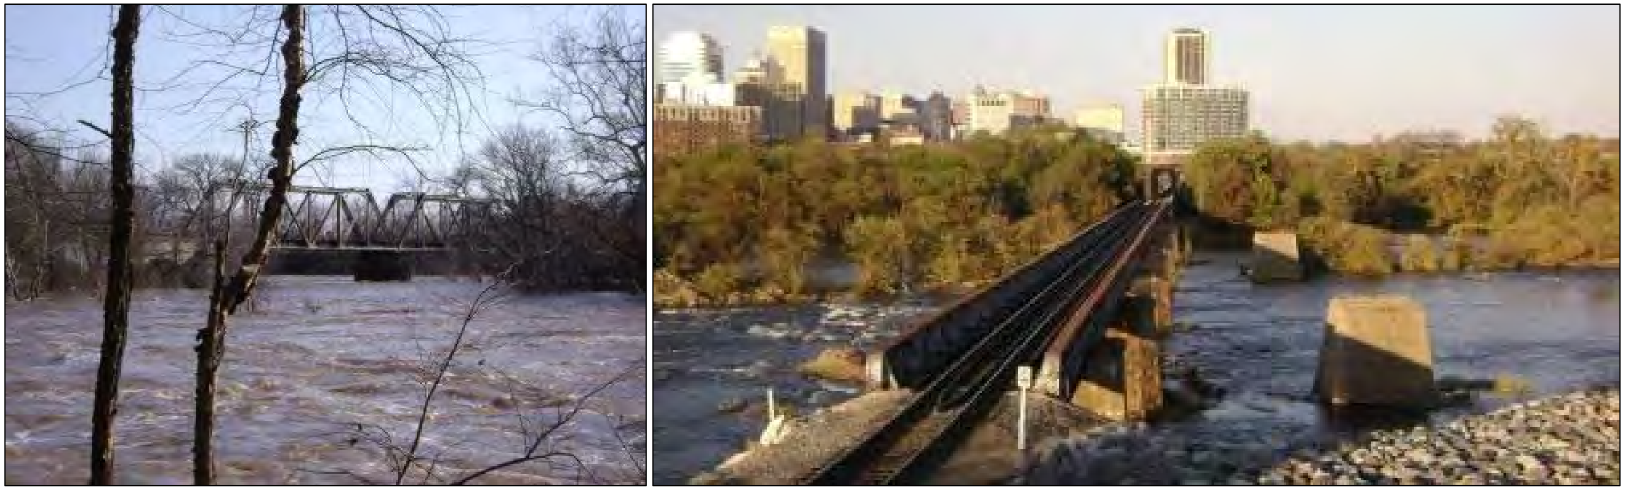

FIGURE 3-162: VIEW OF THE THROUGH TRUSS BRIDGE CARRYING THE SOUTHERN RAILWAY SEGMENT ACROSS THE JAMES RIVER, LOOKING SOUTHEAST (LEFT); VIEW OF THE JAMES RIVER BRIDGE CARRYING THE SOUTHERN RAILWAY SEGMENT, LOOKING NORTHEAST (RIGHT) (BRIDGEHUNTER.COM 2017C)

3.12.3 NRHP Evaluation

Based on archival research, the Southern Railway Segment (127-6792) was found to be a prominent regional railroad operating throughout the South, with its historic core anchored in Richmond, during the mid-nineteenth and early-twentieth centuries. Formed around six smaller, regional carriers, the Southern Railway transported passengers and freight throughout the South and brought Southern goods to more national markets in the north and west. It was the largest railroad in the south and served a majority of the southeast (American-rails.com 2017a). The line is a product of approximately 150 predecessor lines in the southeast (Southern Railway Historical Association 2017). In order to remain competitive in the modern, oligopoly-focused market, Southern Railway merged with the Norfolk and Western Railroad to form the Norfolk Southern Railroad; this company operates along the historic Southern Railway corridors, as well as in expanded northern and western markets.

The historic Southern Railway Segment corridor has been surveyed in parts on several occasions. As the railroad had played such a significant role in transportation development in both the area around Richmond and in the state as a whole, the railroad has not changed significantly and has retained the majority of its original path and continues to be operated by Norfolk Southern, it is recommended that the Southern Railway Segment is eligible for listing in the NRHP under Criterion A for Transportation.

It has no known association with any individuals of historical significance and was therefore recommended not eligible for listing in the NRHP under Criterion B. Most of its resources have undergone significant changes to their physical makeup and had lost a great deal of their historic character and integrity, leading to the railroad being recommended not eligible for the NRHP under Criterion C. As an architectural resource, it was not evaluated under Criterion D. In sum, the Southern Railway Segment is **recommended eligible for listing in the NRHP under Criterion A for its association with important events that led to broad patterns in regional Transportation.**

The proposed NRHP boundaries follow the historic Southern Railway as outlined in the Architectural Reconnaissance Survey of Structures for the DC2RVA Project (Figure 3-163) (Chase 2017). The segment begins in the Shockoe Bottom area of the City of Richmond and intersects with Bridge #2835 (1275149) running westward on the north embankment of the James River and then runs south across the river and continues westward along the southern embankment of the river. The period of significance for the Southern Railway Segment starts in 1850, its date of construction, and extends to 1968. This end date follows the NPS guidelines which say: “Fifty years ago is used as the closing date for periods of significance where activities begun historically continued to have importance and no more specific date can be defined to end the historic period” (NPS 1997).

3.13 RICHMOND, FREDERICKSBURG, & POTOMAC RAILROAD HISTORIC DISTRICT (500-0001)

The RF&P Railroad Historic District (500-0001) is made up of the RF&P Railroad and a wide variety of associated secondary resources, such as bridges and culverts. The railroad was a privately operated, local railroad that provided rail service between Richmond, Virginia, and Washington, D.C., by way of Fredericksburg, Virginia (Figure 3-164) (V-CRIS 2017). The railroad primarily runs parallel to Interstate 95 and Route 1 on a north-south orientation, although the railroad bed does move laterally to the east and west in areas like Ruther Glen, Guinea, and Woodbridge (Figure 3-165).

From Washington, D.C. to Woodbridge, the railroad bed passes through heavily populated areas including the City of Alexandria and numerous suburban communities; however, in most cases, the railroad does not pass directly though residential areas (with the exception of Alexandria) and instead borders industrial or commercial corridors. As the railroad passes through Marine Corps Base Quantico, the land surrounding it becomes more rural and less densely populated. While this pastoral setting is interrupted as the railroad passes through downtown Fredericksburg, it is the predominant environment as the railroad moves further south through Guinea and Ruther Glen. Numerous small railroad towns are located along its length in this area and owe much of their existence to the rail line. The railroad then passes directly through the heart of downtown Ashland, actually running down the middle of the main road, before returning to a more rural environment. As the railroad approaches Richmond, it passes through more populated areas including the suburbs of Glen Allen and Laurel. Historically, it terminated in the heart of the city at both Broad Street Station and later Main Street Station.

3.13.1 Historic Context

The RF&P Railroad was originally chartered in 1834, making it only the sixth railroad to be chartered in the state and only the third to use steam-powered locomotives (Griffin 1994). The RF&P Railroad, operated by the RF&P Railroad Company, initially received its charter to complete a line linking Richmond to a spot north of Fredericksburg where the railroad could connect with steamship travel on the Potomac River or one of its tributaries (Figure 3-166) (McGehee 1992). By 1837, the railroad had reached the City of Fredericksburg and completed its path to Aquia Creek in 1842. By the 1850s, proposals were already being made to extend the rail line all the way to Alexandria to fully connect Richmond and Washington, D.C. A new company, the Alexandria and Fredericksburg Railroad Company, was chartered in 1851 to complete the project (Mordecai 1940). However, with the outbreak of the Civil War in 1861, expansion plans were tabled.

Throughout the war, both Union and Confederate forces sought to control the railroad and prevent the enemy from utilizing the valuable transportation corridor (Figure 3-167). Both sides tactically destroyed bridges and sections of rail to cover their retreats and to disrupt enemy troop movements while also repairing damage wrought by the opposing army (Figure 3-168). While these cycles of destruction and reconstruction lasted throughout the war, by 1865 most of the railroad was in ruins and virtually unusable. However, the RF&P Railroad quickly began rebuilding and had restored its pre-war service by 1866 and completed the proposed link with the Alexandria and Fredericksburg in 1872 (McGehee 1992).

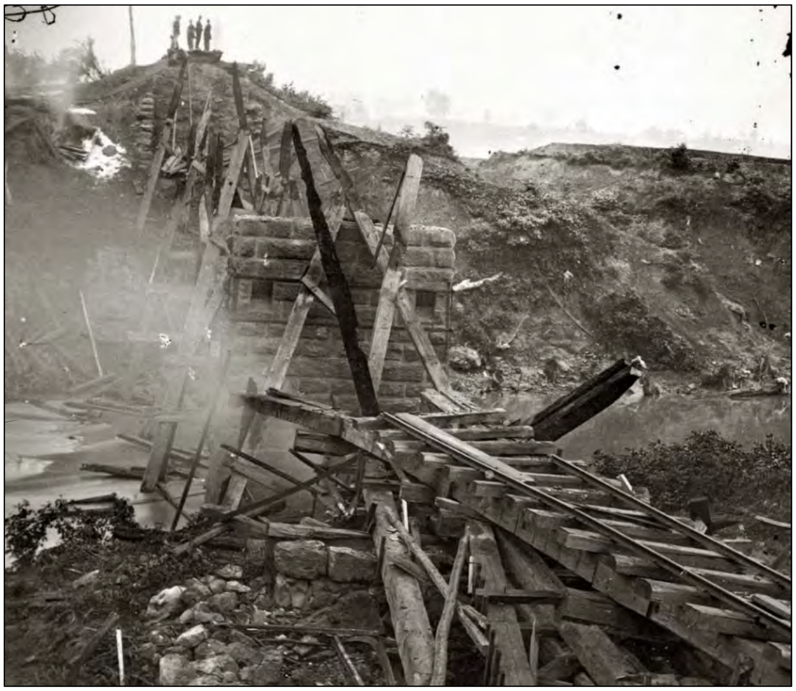

FIGURE 3-168: RUINS OF NORTH ANNA RIVER BRIDGE, MAY 25, 1864 BY TIMOTHY H. O'SULLIVAN (O'SULLIVAN 1864)

As the nineteenth century progressed, the route flourished. The two companies operating the route, the RF&P Railroad Company and the Alexandria and Fredericksburg Railroad Company, prospered, although they continued to function independently of each other until 1901. In September of that year, a holding company called the Richmond-Washington Company was incorporated to own the entirety of both railroads' capital stock and bring them together under a single management structure without outright merging the companies (Mordecai 1940). Under this new management, the RF&P Railroad did not expand its material holdings but continued to grow in regional respect and prosperity. In 1903, the rail line modernized its track by double tracking the entire route from Richmond to Washington, D.C. In Richmond, the RF&P connected with the C&O Railway, the Atlantic Coast Line Railroad and the Seaboard Air Line Railroad. In the Alexandria area, the rail line connected with the Pennsylvania Railroad, Baltimore & Ohio Railroad, Southern Railway, and Washington & Old Dominion Railroad.

The RF&P Railroad operated out of several major switching yards throughout Virginia. One of the largest is the Acca Yard located on the northwest edge of Richmond. The yard was first constructed circa 1895 as a simple siding to serve as a junction between the James River Branch and Belt Line that would divert freight traffic around the city center (Prince 1973). By the early 1900s, the original footprint, while advantageously located, was too small to accommodate more traffic and to facilitate connections with other railroads. It was therefore expanded to become the main RF&P Railroad yard in Richmond and continued to grow with traffic needs throughout the 1910s. In the 1920s, the switching yard expanded to include an engine terminal with a 30-stall roundhouse and massive coaling station (Prince 1973). All locomotive shop work moved into Acca in 1937 and the railroad ran all of its repair and maintenance operations out of Acca from that time onwards. The RF&P Railroad operated the Acca Yard as its primary, and eventually only, yard throughout the rest of the twentieth century, eventually becoming part of the CSXT network in the 1991 acquisition.

First opened in 1906, Potomac Yard quickly became one of the primary yards used by numerous railroads passing through Washington (McGehee 1992). The facility operated two receiving yards, classification yards, gravity humps used to sort cars, and a roundhouse in addition to numerous other amenities for passing trains (Figure 3-169). Originally operated by the Richmond-Washington Line, the RF&P Railroad took over the yard's ownership in 1920 (Prince 1973).

After the 1929 stock market crash and the onset of the Great Depression, the RF&P Railroad faced many of the same challenges as most small, regional railroads across the country. Many Americans either outright curtailed travelling or opted for less-expensive, motorized public transportation. Freight transportation also dropped significantly with marked cutbacks in the overall consumption of goods (Griffin 1994). However, the railroad had always been somewhat involved in real estate ventures to acquire land for track expansions and this section of the business helped sustain the company through the Depression. A separate division was later created within the company in the 1950s, titled the Richmond Holdings Company, to more efficiently handle the RF&P Railroad's land assets.

During World War II, American rail traffic increased significantly as the economy recovered, gasoline and tire rubber were rationed, and troops and war materiel moved all across the country (Mordecai 1948). However, the war-time boom for railroads like the RF&P Railroad was short lived. With the double tracking and faster, heavier locomotives, the rail line continued to improve its track with grade reductions, curve straightening, and structures to accommodate additional weight (American-Rails.com 2017b). While freight-driven companies like the C&O Railroad continued to thrive on shipments of coal and manufactured goods, the RF&P Railroad and other passenger-driven companies faced stiff competition from the burgeoning popularity of the personal car and commercial air travel. The development of the Interstate Highway System, especially Interstate 95 on a parallel route to the railroad, made personal-vehicle transportation even easier and further cut into the railroad's business (Figure 3-170). As rail ridership continued to decrease throughout the 1960s, the Richmond Holdings Company gradually became the primary source of income for the company. By 1970, passenger traffic had dropped so dramatically across the country that the federal government issued the Rail Passenger Service Act to create a single, strong, public-private railroad known as Amtrak (Amtrak Reform Council 2000). Amtrak took over passenger service for the RF&P Railroad later that decade, leaving the company to focus on its freight traffic and real estate development (Figure 3-171).

Since the railroad was no longer providing passenger service, the company began focusing almost exclusively on developing its real estate branch. In 1988, the company underwent a massive restructuring to officially make its focus real estate; to that end, it created the RF&P Corporation, which specialized in real estate investing, leasing, and management (McGehee 1992).

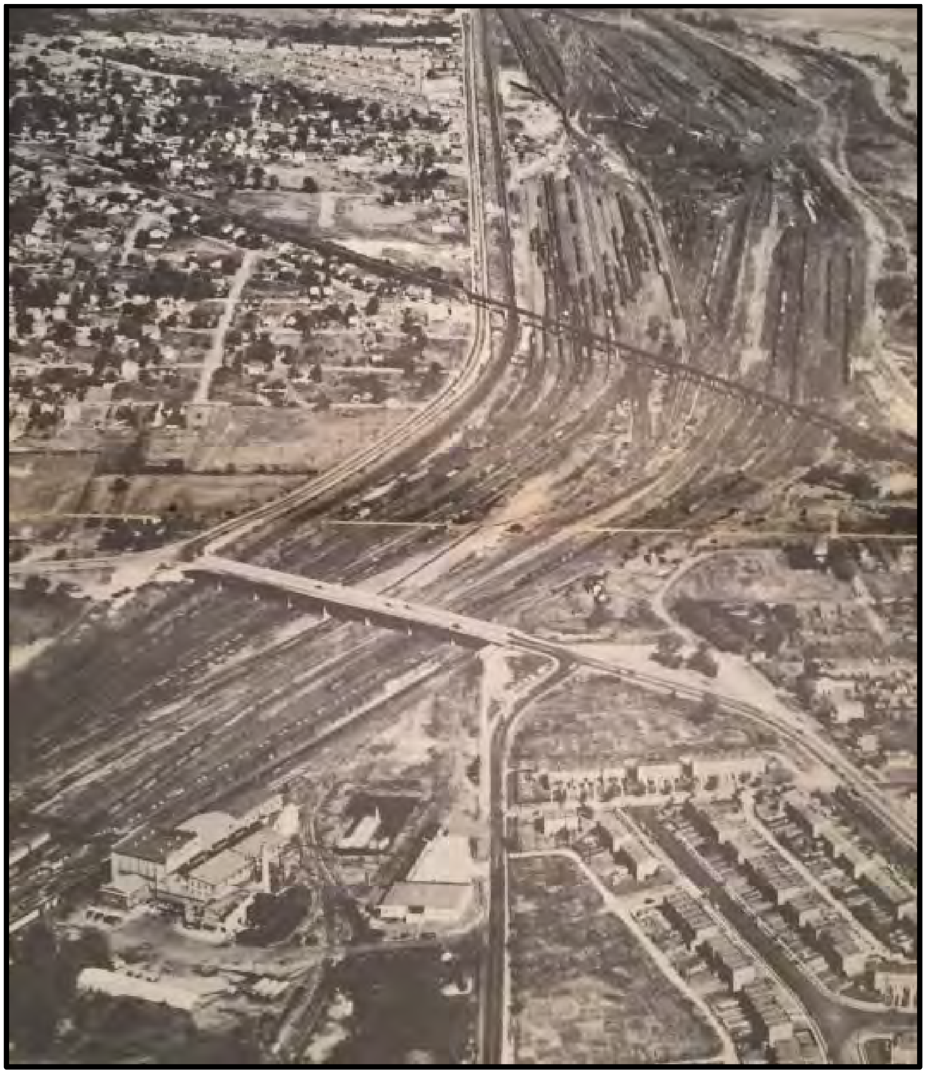

FIGURE 3-169: AERIAL VIEW OF POTOMAC YARD CIRCA-1945 (MORDECAI 1948)

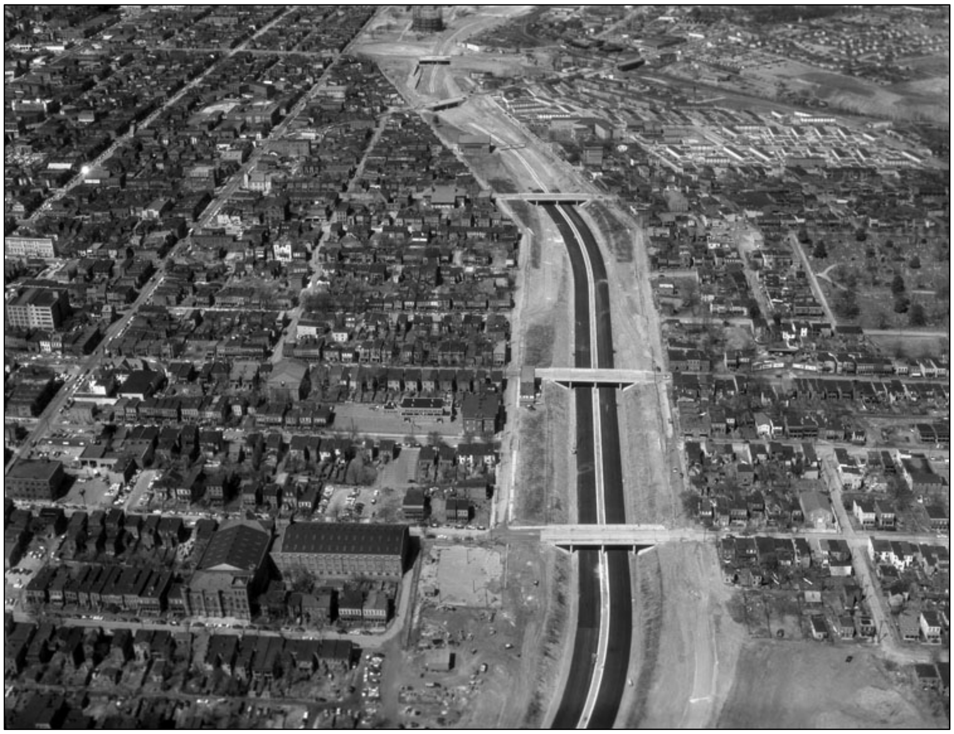

FIGURE 3-170: INTERSTATE 95 IN RICHMOND, 1958 (KOLLATZ 2015)

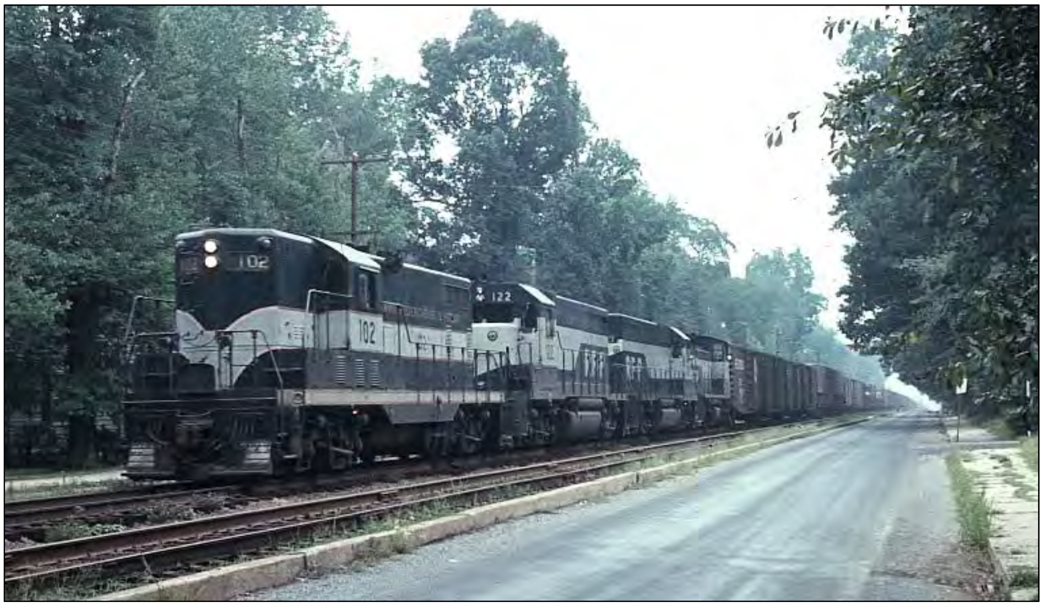

FIGURE 3-171: AN RF&P FREIGHT TRAIN IN ASHLAND CIRCA-1970, AFTER PASSENGER SERVICE WAS DISCONTINUED (BERNARD 2013)

By the 1970s, the Richmond-Washington Company still held over 60 percent of the RF&Ps voting stock. But while the Company held majority control over RF&P Railroad stock, its own stock was held by two major, eastern railroad companies: Chessie Systems Inc. (formerly the C&O Railway) and the Seaboard System Railroad. When these two companies merged in 1980 to form CSXT, they sought to acquire the RF&P Railroad from the Richmond-Washington Company (McGehee

1992). The RF&P Railroad held out against the acquisition throughout the 1980s to see out their corporate restructuring.

In 1991, CSXT struck a deal with the other major RF&P Railroad stockholder, the Virginia Retirement System (VRS), to acquire the railroad. VRS acquired 99 percent of the RF&P Corporation's shares and then sold the entirety of the railroad stock to CSXT. VRS kept the real estate branch for a while before selling it off as well. With these two deals, the RF&P ceased to exist as its own independent enterprise (McGehee 1992). However, many of its historic rail line and its associated structures remain and are still used by CSXT and Amtrak traffic (Figure 3-172). The Virginia Railway Express (VRE) began in 1992 and continues to operate during the week on the former RF&P line, providing passenger service from Richmond to Washington, D.C. (Vre.org 2017).

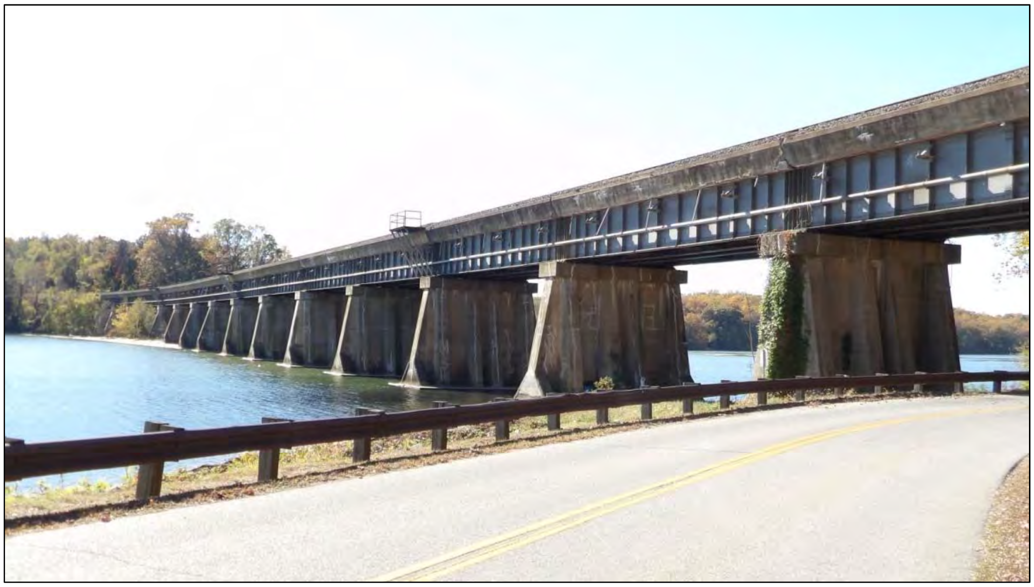

FIGURE 3-172: THE CIRCA-1945 AQUIA CREEK BRIDGE (500-0001-0028)

3.13.2 Architectural Description

The RF&P Railroad is a double-tracked line running primarily through rural areas and modestly-populated towns almost exclusively at ground level (Figure 3-173). As the railroad passes through more urban areas, such as downtown Richmond, Fredericksburg, and Alexandria, the rail bed is typically elevated to accommodate vehicular traffic and ease congestion in the urban centers (Figure 3-174). Numerous bridges, primarily dating to the first two decades of the twentieth century, carry the railroad across some of the major waterways in the area including the Rappahannock, North Anna, South Anna, Occoquan, and Potomac rivers and large creeks like the Aquia and Chopawamsic (Figure 3-175). Other structures carry track over highways, minor roads and waterways, and former livestock crossings (Figure 3-176).

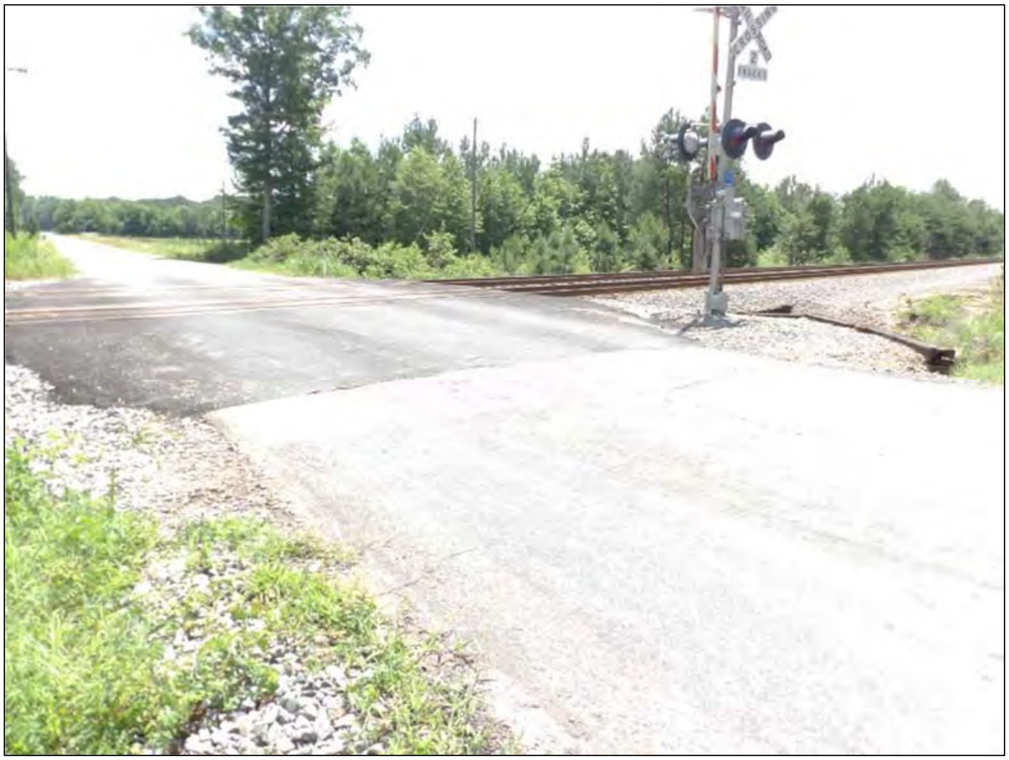

FIGURE 3-173: VIEW OF THE RF&P RAILROAD CROSSING AT PAIGE ROAD IN WOODFORD, LOOKING WEST

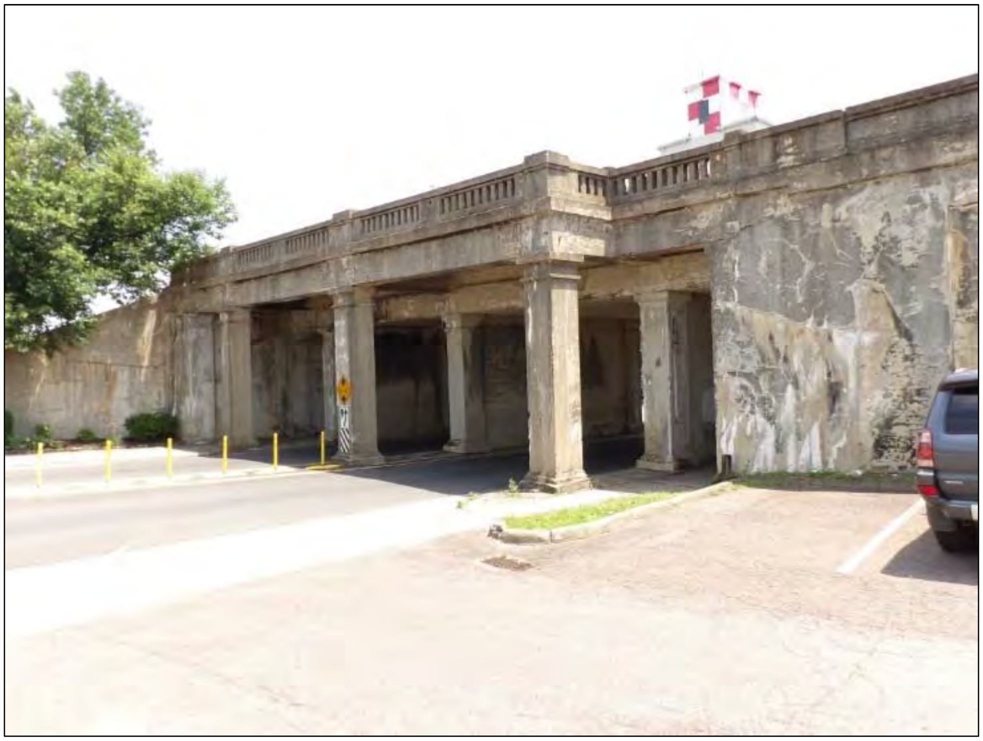

FIGURE 3-174: VIEW OF THE ELEVATED TRACK OF CHARLES STREET BRIDGE IN FREDERICKSBURG, PART OF THE RAPPAHANNOCK RIVER RAILROAD BRIDGE (111-0132-0025)

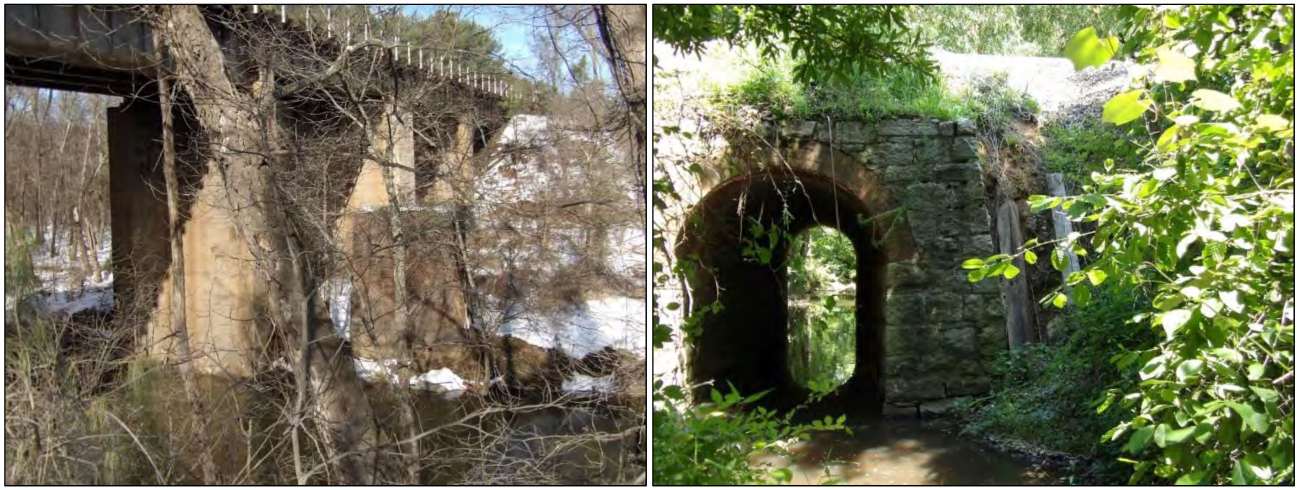

FIGURE 3-175: A RAILROAD BRIDGE OVER THE NORTH ANNA RIVER (042-0731), NORTH OBLIQUE (LEFT); A RAILROAD CULVERT OVER A STREAM NEAR LORTON MARKET ROAD (500-0001-0019), LOOKING EAST (RIGHT)

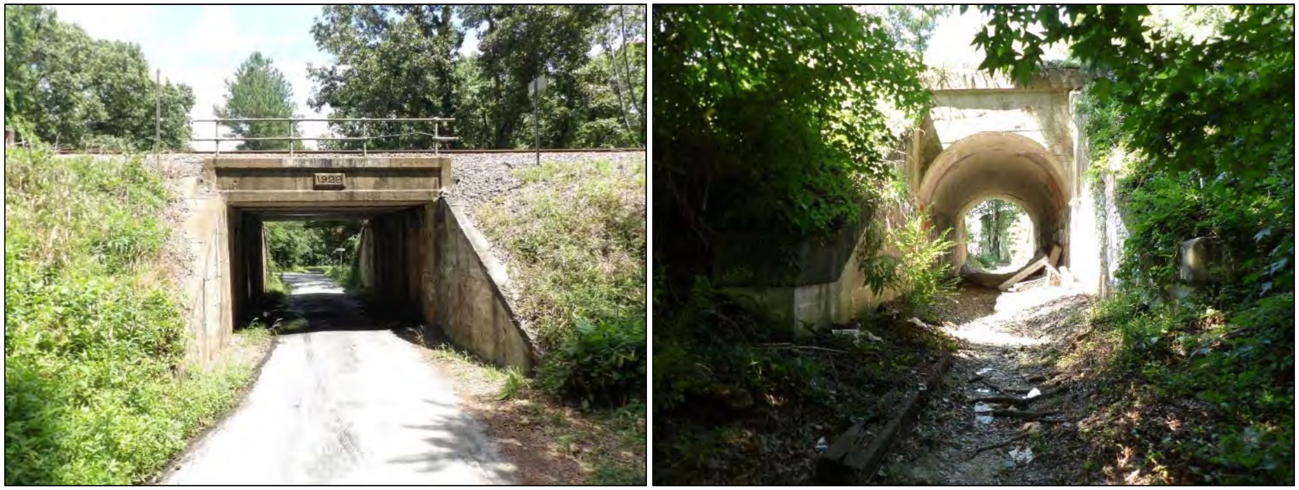

FIGURE 3-176: A RAILROAD CULVERT WEST OF DABNEY ROAD, USED TO ALLOW LIVESTOCK TO PASS (500-0001-0023), LOOKING WEST (LEFT); BRIDGE AT TAYLORSVILLE ROAD (042-5306), LOOKING EAST (RIGHT)

Much of the structures of the Acca Yard relating to the early twentieth century have been removed from the landscape. Over the years the yard has been downsized with the outer acreage developed for other commercial and industrial purposes. The current yard includes numerous tracks with a few maintenance buildings dating to the 1960s or later.

The other major switching yard used by the RF&P Railroad was the Potomac Yard located in Alexandria, just south of Four Mile Run. While the Acca Yard remained a vital part of the RF&P's operations throughout the twentieth century, Potomac Yard's significance waned as the company lost passenger and freight traffic in the 1960s and 1970s. When the railroad reorganized in the 1980s, Potomac Yard closed permanently and has since been significantly developed with multi-family residential and commercial buildings between Route 1 and the Potomac River (Lamb 1991).

3.13.3 NRHP Evaluation

The RF&P Railroad Historic District (500-0001) is an historic rail corridor that stretches from the Potomac River to Main Street Station in the City of Richmond. From 1837 to 1943, the railroad played a critical role in the development and evolution of the region and was a prominent local railroad within the mid-Atlantic region. Previously, the RF&P Railroad was documented into two segments: a segment in Prince William and Stafford Counties (076-0301) and a segment in Spotsylvania, Caroline, Hanover, and Henrico Counties (088-5413). These were previously determined to be potentially eligible for the NRHP under Criterion A for their association with Transportation in Virginia (2016 and 2012, respectively). Since that time, the rail line from the Potomac River to Broad Street Station has been surveyed, encompassing these two segments into one rail corridor. The trains under CSXT, Amtrak, and VRE continue to run along the former RF&P rail line. Given the long and significant history of this line and the important economic role it has played in the development of cities along its path, it is recommended that the RF&P Railroad Historic District, from Washington, D.C., to Richmond, Virginia, is eligible for listing in the NRHP under Criterion A for Transportation.

It has no known association with any individuals of historical significance and, is therefore, recommended not eligible for listing in the NRHP under Criterion B. Although some of the elements within the railroad corridor like bridges and switch towers may be individually eligible for the NRHP, the corridor as a whole has undergone numerous physical changes that have impacted its overall integrity. It is therefore recommended not eligible for the NRHP under Criterion C. As an architectural resource, it was not evaluated under Criterion D. The bridges, culverts, towers, and other structures along the line were individually surveyed at the reconnaissance-level as part of the DC2RVA Project and documented for their potential as a contributing element to the rail line. In sum, the DC2RVA Team **recommends that the RF&P Railroad Historic District is eligible for listing in the NRHP under Criterion A for its association with important events that led to broad patterns in regional Transportation**.

The proposed NRHP boundaries follow the historic RF&P Railroad line as outlined in the architectural reconnaissance survey of structures for the DC2RVA Project (Figure 3-177) (Chase 2017). The period of significance for the RF&P Railroad Historic District starts in 1837, its date of construction, to 1943. This end date follows the NPS guidelines which say: "Fifty years ago is used as the closing date for periods of significance where activities begun historically continued to have importance and no more specific date can be defined to end the historic period" (NPS 1997).

4 SUMMARY AND RECOMMENDATIONS

The DC2RVA Project Team conducted an intensive-level architectural survey of a total of 54 resources, 13 of which are presented in the current report. The DC2RVA project is being completed under the auspices of the FRA in conjunction with the DRPT. Because of FRA's involvement, the undertaking is required to comply with the NEPA and Section 106 of the National Historic Preservation Act of 1966, as amended. The Project is being completed as DHR File Review #2014-0666.

Of the 13 resources detailed in this report, the DC2RVA Project Team are recommending 11 as individually eligible for the NRHP (Table 4-1). Listed in numerical order, they are as follows: Slaughter Pen Farm (088-0254), Fredericksburg Historic District Expansion (111-0009), Pulliam's Service Station (111-0009-0795), Purina Tower (111-0132-0020), Rappahannock River Railroad Bridge (111-0132-0025), George Aler House (111-0132-0522), Fredericksburg Train Station (111-0132-0704), Southern Railway (127-6792), C&O Railroad (127-6793), RF&P Railroad Historic District (500-0001), and RF&P Railroad Bridge over Occoquan (500-0001-0022). Of those, one resource (088-0254) is recommended as contributing to the Fredericksburg and Spotsylvania County Battlefields National Military Park Historic District (111-0147), one resource (111-0009-0795) is recommended as contributing to the Fredericksburg Historic District Expansion (111-0009), two resources (111-0132-0025 and 500-0001-0022) are recommended as contributing to the RF&P Railroad Historic District (500-0001), and four resources (111-0132-0020, 111-0132-0025, 111-0132-0522, and 111-0132-0704) are recommended as contributing to the Fredericksburg Historic District (111-0132).

During the current survey, the DC2RVA Team found that the remaining two resources (111-0023 and 127-6840) are no longer extant and as such are recommended as not individually eligible for the NRHP (Table 4-1).

TABLE 4-1: TABLE OF SUMMARY AND RECOMMENDATIONS OF THE ARCHITECTURAL RESOURCES PRESENTED IN THE CURRENT REPORT

ABSTRACT

Dovetail Cultural Resource Group (Dovetail), as a member of the Washington, D.C. to Richmond Southeast High Speed Rail (DC2RVA) Project Team and on behalf of the Virginia Department of Rail and Public Transportation (DRPT), conducted an intensive-level architectural survey of the DC2RVA Project. The proposed Project is being completed under the auspices of the Federal Railroad Administration (FRA) in conjunction with DRPT. Because of FRA's involvement, the undertaking is required to comply with the National Environmental Policy Act (NEPA) and Section 106 of the National Historic Preservation Act of 1966, as amended. The Project is being completed as Virginia Department of Historic Resources (DHR) File Review #2014-0666. Dovetail and the DC2RVA Team completed 16 reports detailing the results of the reconnaissance-level survey and coordinated the results with the DHR between 2015 and 2017.

Subsequent analysis included an investigation-level evaluation of architectural resources recommended potentially eligible for listing in the National Register of Historic Places (NRHP) during the reconnaissance-level survey that are located within the Preferred Alternative of the DC2RVA Project. The goals of this investigation were to: first, document the architectural and landscape features of the properties; second, gather archival data on the properties; and third, examine the physical and historical information collected within the appropriate context(s) to properly evaluate each property under established criteria for the NRHP. The fourth goal of this investigation was to propose NRHP boundaries for any property should it be recommended eligible for listing. Work on this project was conducted in 2017 and 2018, in accordance with relevant state and federal regulations as part of the compliance process established in Section 106 of the National Historic Preservation Act of 1966, as amended (36 CFR 800).

In total, the DC2RVA Project Team surveyed 52 historic architectural resources at the evaluation level, 21 of which are detailed in the current report (the remaining 31 resources are presented in two other intensive-level survey reports). Of those 21 resources, the DC2RVA Project Team is recommending that 15 are individually eligible for listing in the NRHP (100-0277, 029-5741, 016-0092, 016-0222, 016-0223, 016-0224, 016-0286, 016-5136, 016-5165, 042-5466, 042-0469, 042-5448, 043-0292-0001, 127-0344-0123, and 127-6129) while six (016-0270, 016-5129, 042-0468, 042-0470, 043-5636, and 127-0197) are recommended not individually eligible.

1 INTRODUCTION

Dovetail Cultural Resource Group (Dovetail), on behalf of the Virginia Department of Rail and Public Transportation (DRPT), conducted an intensive-level architectural survey of resources along the Preferred Alternative of the Washington, D.C. to Richmond Southeast High Speed Rail (DC2RVA) Project. The proposed Project is being completed under the auspices of the Federal Railroad Administration (FRA) in conjunction with DRPT. Because of FRA's involvement, the undertaking is required to comply with the National Environmental Policy Act (NEPA) and Section 106 of the National Historic Preservation Act of 1966, as amended. The Project is being completed as Virginia Department of Historic Resources (DHR) File Review #2014-0666.

The FRA and DRPT propose passenger rail service and rail infrastructure improvements in the north-south travel corridor between Washington, D.C. and Richmond, VA. These passenger rail service and rail infrastructure improvements are collectively known as the DC2RVA Project. The Project will deliver higher speed passenger rail service, increase passenger and freight rail capacity, and improve passenger rail service frequency and reliability in a corridor shared by growing volumes of passenger, commuter, and freight rail traffic, thereby providing a competitive option for travelers going between Washington, D.C. and Richmond and those traveling to and from adjacent connecting corridors. The Project is part of the larger Southeast High Speed Rail (SEHSR) corridor (Figure 1-1), which extends from Washington, D.C. through Richmond, VA; and from Richmond continues east to Hampton Roads (Norfolk), VA, and south to Raleigh, NC; and Charlotte, NC, and then continues west to Atlanta, GA, and south to Florida. The Project connects to the National Railroad Passenger Corporation (Amtrak) Northeast Corridor (NEC) at Union Station in Washington, D.C.

The purpose of the SEHSR program, as stated in the 2002 Tier I Final Environmental Impact Statement (EIS) completed for the full SEHSR corridor, is to provide a competitive transportation choice to travelers within the Washington, D.C. to Charlotte travel corridor. The purpose of the current Washington, D.C. to Richmond SEHSR project described here is to fulfill the purpose of the SEHSR Tier I EIS within this segment of the larger SEHSR corridor. The Project, by increasing rail capacity and improving travel times between Washington, D.C. and Richmond, will improve passenger train frequency, performance and reliability in the corridor, enabling intercity passenger rail to be a competitive transportation choice for travelers between Washington, D.C. and Richmond and beyond.

Given FRA's funding involvement and permitting through various other federal agencies, the DC2RVA project is required to comply with Section 106 of the National Historic Preservation Act of 1966, as amended, and the Act's implementing regulations under 36CFR800. Additionally, all cultural resource work was designed by DRPT and Dovetail to comply with the Virginia Antiquities Act (Code of Virginia § 10.1-2300) and guidelines and regulations promulgated by the DHR as necessary.

Previous Project studies included a reconnaissance survey of all alternatives under consideration, completed between 2015 and 2017. In September 2017, a DRPT-recommended Preferred Alternative was presented in the Draft EIS. DRPT's recommended Preferred Alternative was approved by the Commonwealth Transportation Board for recommendation to FRA in December 2017. Intensive-level architectural studies were therefore completed for above-ground resources determined to be potentially eligible by the DHR within the area of potential effects (APE) of the Commonwealth's recommended Preferred Alternative. The current report focuses on the results of the intensive-level investigations completed by Dovetail on 21 of the 52 architectural resources that comply with these study parameters, organized in the body of this report in geographical order from north to south. The remainder of the resources are detailed in separate reports (Table 1-1).

1.1 PROJECT LOCATION

The Washington, D.C. to Richmond corridor spans approximately 123 miles along the existing rail corridor owned by CSX Transportation (CSXT) between Control Point RO (milepost [MP] CFP 110) in Arlington, VA, to the CSXT A-Line and S-Line junction at MP A-11 in Centralia, VA (Chesterfield County). For the purposes of conceptual engineering and environmental planning, the DC2RVA corridor has been subdivided into six Areas that correspond with improvements and alternatives, and as such have been named and numbered from north to south (Figure 1-2). At the northern terminus in Arlington, VA, the Project limit for infrastructure improvements ends at the southern approach to Long Bridge, a double-track rail bridge taking the rail corridor over the Potomac River; however, the northern terminus of Union Station in Washington, D.C. is used for ridership and revenue forecasting, as well as service development planning within the Project corridor. The southern terminus in Centralia is the junction of two CSXT routes that begin in Richmond and rejoin approximately 11 miles south of the city.

Proposed improvements are along CSXT-owned track and right-of-way, generally parallel to the I-95 corridor between northern Virginia and Richmond. From north to south, the project travels through the following counties and cities:

- Arlington County
- City of Alexandria
- Fairfax County
- Prince William County
- Stafford County
- City of Fredericksburg
- Spotsylvania County
- Caroline County
- Hanover County
- Henrico County
- City of Richmond
- Chesterfield County

In Arlington, the Project connects to existing CSXT track extending across the Potomac River on the Long Bridge into Washington, D.C. and Union Station, the southern terminus of Amtrak’s Northeast Corridor (NEC). At Centralia, the Project connects to both the Richmond to Raleigh segment of the SEHSR corridor and the Richmond to Hampton Roads segment of the SEHSR corridor.

The Washington, D.C. to Richmond segment is an integral part of the overall Washington, D.C. to Charlotte SEHSR corridor and provides a critical link between high speed intercity passenger service from Boston to Washington, D.C. and the southeastern United States.

Figure 1-2

DC2RVA Project Corridor

1.2 PROJECT DESCRIPTION

The DC2RVA project will include specific rail infrastructure improvements and service upgrades intended to improve the travel time, service frequency, and on-time performance of passenger trains operating between Washington, D.C. and Richmond, VA. Specific improvements to the existing rail infrastructure between Arlington, VA, and Centralia, VA include:

- Corridor-wide upgrades to existing track and signal systems to achieve higher operating speeds, including curve realignments, higher-speed crossovers between tracks, passing sidings, and grade crossing improvements.
- Corridor-wide improvements to train operating capacity to achieve higher passenger train service frequency and reliability, including an additional main track along most of the corridor, and additional controlled sidings, crossovers, yard bypasses and leads, and other capacity and reliability improvements at certain locations.
- Station and platform improvements for Amtrak and Virginia Railway Express (VRE) stations.

The Tier II EIS being completed for the Project will assess the environmental impacts of these improvements and identify ways to avoid, minimize, or otherwise mitigate such impacts.

Studies in support of the Project address passenger and freight rail operations and service between Union Station in Washington, D.C. and Richmond and beyond, but the Project does not include physical improvements to the Long Bridge across the Potomac River or to rail infrastructure within Washington, D.C. Other projects will address improvements to the rail infrastructure north of Arlington and south of Centralia along the SEHSR corridor.

1.3 CURRENT STUDY

The DC2RVA Team has been conducting reconnaissance-level architectural studies for the entire 123-mile DC2RVA corridor since December 2014. To date, the findings have been detailed in 16 reports. Between January 29, 2016, and March 1, 2017, DHR concurred with the DC2RVA team's recommendations on these 16 reports. In addition, subsequent reconnaissance-level architectural studies are ongoing in areas where the limits of disturbance have been modified since the original work, and the preliminary results have been shared by the DHR to solicit feedback. Through all efforts, it was determined that 54 resources within the Commonwealth's Preferred Alternative should be the subject of intensive study to determine NRHP eligibility (Table 1-1). After communication with the DHR in April 2018, it was determined that two (111-0132-0507 and 166-0033) of the 54 resources should be recommended not eligible as part of the reconnaissance-level survey, and intensive-level survey should be conducted on the remaining 52 resources (Marc Holma, personal communication 2018). This report includes the results of the intensive-level investigations on 21 of the 52 resources (Report B) (See Figures 1-3 through 1-9.) The remaining 31 resources are presented in two associated reports (Report A and Report C).

Documentation and research for this project were conducted in accordance with relevant state and federal guidelines as part of the compliance process established in Section 106 of the National Historic Preservation Act of 1966, as amended (36 CFR 800). Fieldwork and archival research was completed between March 2017 and February 2018. During this period, DHR records were consulted and various municipal and private repositories, including land and tax records, as well as historical and genealogical societies were visited. A background literature and records review of the architectural APE at the DHR was conducted as part of the reconnaissance survey completed during the previous architectural studies for the Project (e.g., Anderson and Staton 2016; Staton and Lesiuk 2015, etc.).

2 METHODOLOGY

The architectural investigation for the DC2RVA Project was conducted to examine any historic buildings, objects, or districts over 48 years in age for NRHP eligibility concurred by DHR to be potentially eligible for listing in the NRHP. Each potentially eligible resource was evaluated with regard to NRHP Criterion A, for its association with events that have made a significant contribution to the broad patterns of our history; Criterion B, for its association with people significant in our nation's history; Criterion C, for its embodiment of distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or possess high artistic values. As part of the current survey, these architectural resources were not evaluated under Criterion D for its potential to yield information important in history. Additionally, each resource's integrity was addressed through seven aspects or qualities: location, design, setting, materials, workmanship, feeling, and association. Criteria considerations were taken into account only where necessary. This report meets the standards set forth by the DHR's architectural survey manual (DHR 2017).

Field recordation included an in-depth physical examination of each resource, including the interiors when accessible; digital photographs documenting the primary elevation, oblique angles, occasionally interiors, and general setting; detailed site plans of the property and floor plans were prepared when applicable. Archival research on each resource was conducted at land record repositories for various municipalities, historical and genealogical societies, online repositories of historic records, local libraries, and the Library of Virginia.

After the architectural fieldwork, research, and evaluation was completed, the Project Team prepared separate Virginia Cultural Resource Information System (V-CRIS) forms and accompanying documentation for each recorded property in accordance with DHR policies and practices. Each V-CRIS packet includes a V-CRIS form, site plan, set of hard-copy color photographs, and a CD of digital photos for each property to meet with the current DHR standards (DHR 2017).

3 SURVEY RESULTS

Dovetail completed intensive-level architectural investigations on 52 resources potentially eligible for the NRHP, 21 of which are detailed in the following chapter. The remainder of the resources is examined in separate reports.

3.1 PHOENIX MILL (100-0277)

The Phoenix Mill, currently used as an office building for a self-storage facility, is located at 3640 Wheeler Avenue in the City of Alexandria, Virginia (Figure 3-1). The former mill sits upon a parcel containing approximately 2 acres on the south side of Wheeler Avenue in the southeastern part of the city with the existing railroad bed located immediately south of the property. The building is situated in the property's northwest corner, facing, and minimally setback from, Wheeler Avenue and the public concrete walkway that lines the road. The building is immediately surrounded by a paved-asphalt parking lot to the north, east, and south. Metal, chain link fencing lines the property boundaries to the west, south, and east, and the eastern two-thirds of the property is enclosed in fencing due to new construction. The property is accessed by two vehicular entrances from Wheeler Avenue, one in the northwest corner and another in the northeast corner. A contemporary French drain composed of stones runs north-south along the southwest elevation of the building. During the 2018 DC2RVA intensive-level survey, the boundaries for this resource were restricted to the parcel on which the main mill building sits. Upon closer inspection, the DC2RVA Team determined that new construction and parking lots adjacent to the mill building diminish the historic integrity of this resource and have no known historical connection, and as such, the team restricted its boundaries to include the mill building, drain, and immediate landscaping.

3.1.1 Historic Context

The area in which the former Phoenix Mill is located was once part of Fairfax County and then was annexed by the City of Alexandria in the 1950s. The earliest record of the mill dates to February 1777, when George Gilpin requested a survey of a 1-acre parcel specifically condemned for the construction of a mill on Holmes Run, which extended north to northwest from Cameron Run and fed into Hunting Creek (Figure 3-2) (Fairfax County Deed Book [FCDB] M-1:321). During his lifetime, Gilpin had a number of occupations, one of which was a wheat merchant. Alexandria and the area surrounding it was one of the leading centers for flour production during the late-eighteenth century, and Gilpin followed a trend at that time when a number of mills were petitioned for or built throughout Fairfax County and the City of Alexandria (Netherton et al. 1978:80). In 1770, he was appointed city inspector of flour in Alexandria and was given that position again in 1775 and 1781 through 1785 (Bedini 1998).

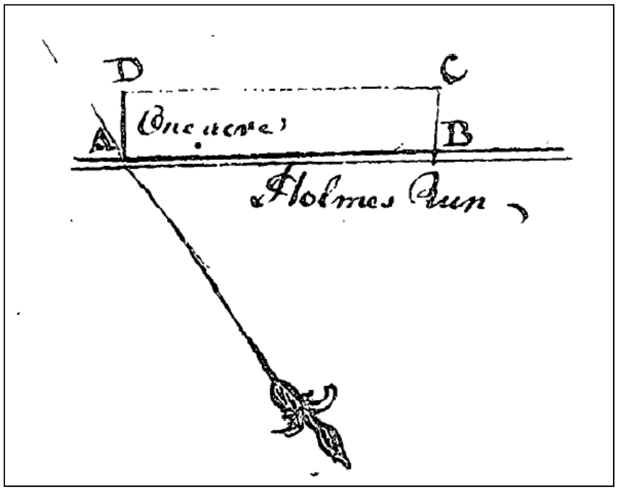

FIGURE 3-2: SURVEY OF 1 ACRE CONDEMNED FOR A MILL BY THE REQUEST OF GEORGE GILPIN IN 1777 (FCDB M-1:321)

Gilpin and his partner, William Hartshorne, were dual owners of the condemned 1 acre of land as well as an adjoining 236 acres (FCDB B-2:297, M-2:141–146). It is unclear when Gilpin abandoned the partnership with Hartshorne, though in 1812, Hartshorne was forced to publicly sell the property after defaulting on a mortgage (FCDB M-2:141–146). In an advertisement placed in the *Alexandria Gazette*, the mill and farm occupied by William Hartshorne, "by the name of Strawberry Hill, situated Holmes Run, and the Little River Turnpike [Route 236]," contained 236 acres. Of that land, 50 acres was used for timber and 70 acres was pasture watered by the creek and mill (Alexandria Gazette 1812). Along with a two-story frame dwelling, stables, and a stone springhouse—all which are longer extant—the brick mill was advertised to be "55 feet by 45, four stories high with three pair of large Burr and one pair of country Mill Stones, capable of manufacturing ten thousand barrels of flour annually. The stream is large and constant, and affords a fall sufficient for water wheels 19 feet in diameter" (Alexandria Gazette 1812).

Thomas Wilson of Jefferson County purchased the 236-acre mill and farm tract for $11,460.66 in September 1812 (FCDB M-2:141–146). Less than 10 years later in 1821, Wilson died and willed the property, which he named Phoenix Mill, to be evenly divided amongst his children whom subdivided it shortly thereafter in 1825 (FCDB S-2:387–392, U-2:407–418). After several Chancery Court cases between the siblings, beginning in May 1839 and continuing through 1849, 56 acres, including the mill from the original 236-acre tract descended to John H. Brown, son of William Brown and a daughter of Thomas Wilson, as captured in a 1860s detailed map of Virginia where the mill building is noted as "Brown's Mill" (Figure 3-3) (Fairfax County Chancery Case 1849; United States Army Corps of Engineers 1860s). This case occurred during a pivotal time in the development of the area of Fairfax and Alexandria. The Orange and Alexandria Railroad was charted in May 1848 to run from Alexandria west towards Gordonsville, crossing through the southern part of Fairfax County immediately south of the mill (Johnson, III 2004:1). Construction on the rail corridor began in 1850 and ended in 1854.

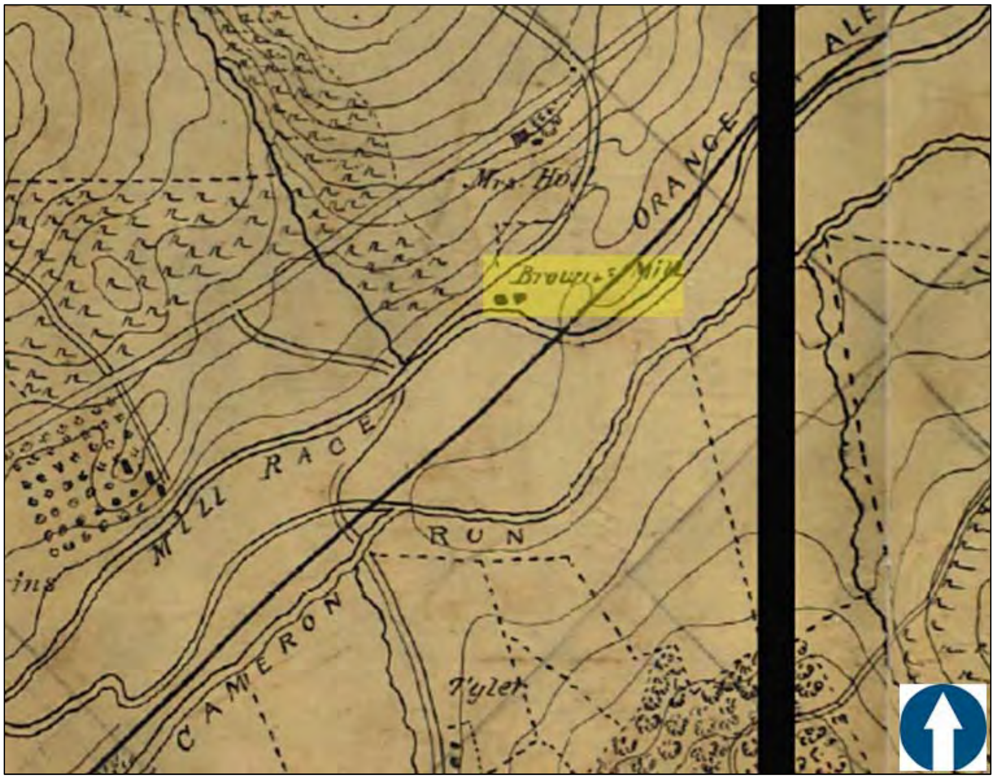

FIGURE 3-3: PHONEIX MILL, CALLED BROWN'S MILL AT THE TIME, IN A CIRCA 1860 MAP OF NORTHERN VIRGINIA SHOWING THE NEW ORANGE AND ALEXANDRIA RAILROAD IMMEDIATELY SOUTH (UNITED STATES ARMY CORPS OF ENGINEERS 1860S) (MAP NOT TO SCALE)

Brown sold the property, described as "Old Dominion Mills" in the indenture, to John M. Johnson of Alexandria in 1888, and it was transferred again in 1896 to Frank M. Hill (FCDB H-5:52–53, X-5:303–305). In 1903, Frank Hill and his wife, Elizabeth R., conveyed the 56-acre Phoenix Mill tract and an addition 27-acre tract on Holmes Run (Route 236) to Charles Branner Cockrell for $7,000 (FCDB L-6:659–662). Charles Cockrell invested a significant amount of funds into making the property a "first class mill again and [to] run a lucrative business as a miller" (Lundegard 2009). Cockrell, a corn famer who lived at Strawberry Hill, brought a case against the Southern Railway Company, who acquired a large tract in Fairfax known as Meadow Farm. Meadow Farm had two water sources that supplied water to the mill: Back Lick Run and Holmes Run. The agent for the rail company was planning to divert one of the water sources away from the mill and render the mill useless; however, the case was dismissed by motion of Cockrell when satisfactory adjustment was made outside of court. In 1922, Cockrell conveyed 3.32 acres partitioned from the larger 56-acre tract to Patrick and Kate M. Cullenton, which reflects the property shape today (Figure 3-4) (FCDB A-9:31–32).

Oct. 21st 1922.

FIGURE 3-4: 1922 PLAT OF MILL PROPERTY (FCDB A-9:31–32)

The property changed hands several times during the early- to mid-twentieth century remaining fairly unmodified until the 3.32-acre tract was conveyed Samuel Joseph "Joe" Bell in 1958 (Figure 3-5) (City of Alexandria Deed Book [CADB] 355:73; FCDB 503:289–290, 761:97). Bell, a native of Arlington, founded the S. J. Bell Construction Company in 1947 which specialized in the installation of underground utility lines in the Northern Virginia area, and he also was involved in property investing (Levy 1994). In the 1970s, the company partnered with the Bellane Industrial Corporation and the Industrial Maintenance Corporation, all of which Bell owned a portion of, and transferred the tract to Industrial Maintenance Corporation (CADB 751:603–608, 810:296–305, 882:659-665). Joe's brother, Charles R. Bell, who acted as secretary to Samuel Bell's companies, sold his interest in all of the properties they co-owned to his brother in 1983 (CADB 1105:377–380). In Bell's last will and testament, he requested his trustees to attempt to retain any property he owned or stock he owned in his three companies (City of Alexandria Fiduciary File 1994).

One year after the death of Joe Bell in 1995, the mill property was purchased by F & H Properties of Virginia, LLC (F & H Properties) who appear to have subdivided the "old mill property," then 2 acres, before transferring it to JBJ, LLC, a Maryland corporation that merged with F & H Properties in 2006 (CADB 1551:473–491, 010004974:442–443). In 2015, the 2-acre property was conveyed to Wheeler Land, LLC, who constructed a large self-storage warehouse on the property, southeast of the mill (CADB 150019225:50–54). The mill building is currently unoccupied except for a basement office and storage room.

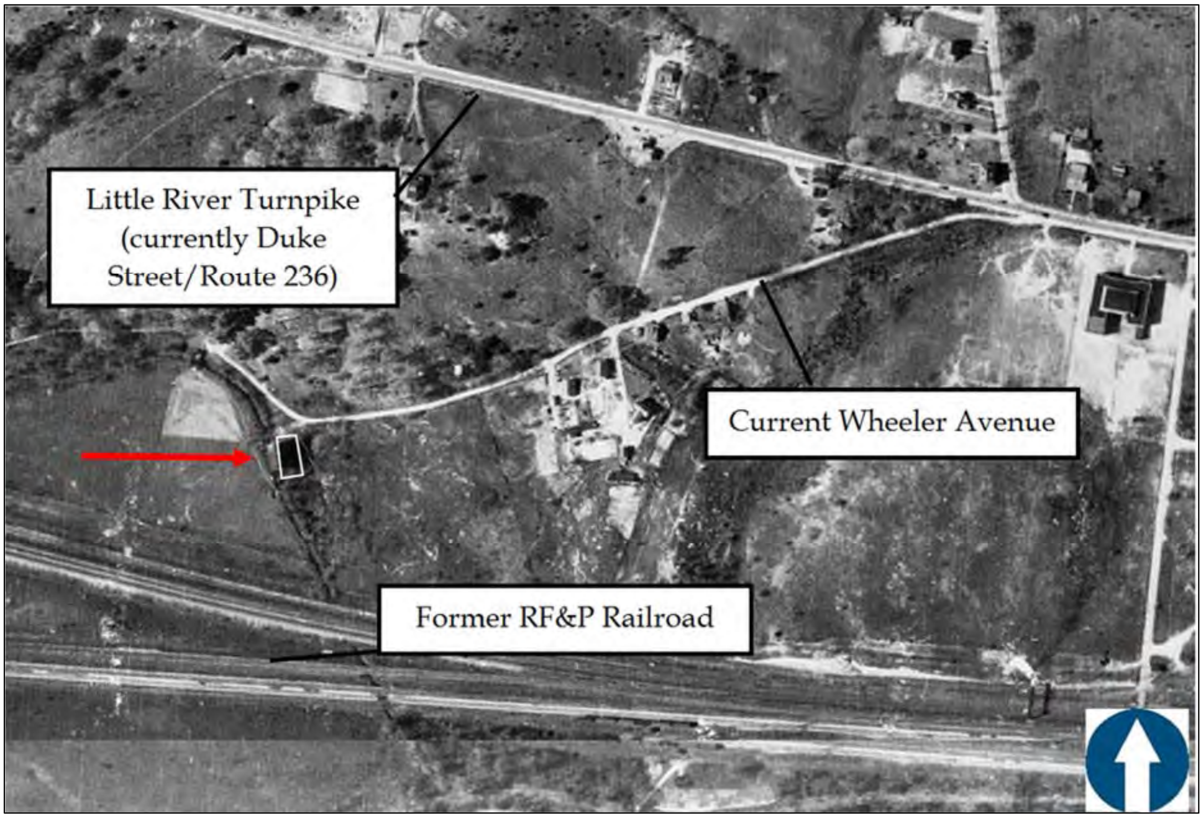

FIGURE 3-5: PHOENIX MILL (DENOTED BY RED ARROW) ON 1937 HISTORIC AERIAL (FAIRFAX AERIAL IMAGERY VIEWER 1937)

3.1.2 Architectural Description

3.1.2.1 Primary Resource Exterior

The property's primary resource is a three-and-one-half-story, three-bay, mill building constructed circa 1780 in a vernacular Southern Colonial form with an original rectangular plan (Figures 3-6 and 3-7). An undated historic image of the mill indicates that upper stories now covered by vinyl siding once contained two rows of windows. Some infill around the building's foundation is also apparent, as the race and waterway that once feed the wheel have been removed (Figure 3-8) (Alexandria Library: Special Collections Record n.d.). Evidence of this infill is seen where a window opening with a segmental arch is partially filled with concrete at the lower level of the east elevation. The building sits on a continuous, raised basement and has a masonry structural system of brick laid in a five-to-one common bond. The roof truss and upper stories of the mill appear to be framed and currently are clad in vinyl siding. It is covered by a steeply pitched gambrel roof sheathed in asphalt shingles with wood boxed eaves on the east and west elevations and returns on the north and south elevations. Metal anchor plates are visible on the eave sides of the building. An interior-end brick chimney with a corbeled cap pierces the roof at the northeast corner of the building.

FIGURE 3-6: SITE PLAN OF PHOENIX MILL AT 3640 WHEELER AVENUE (NOT TO SCALE)

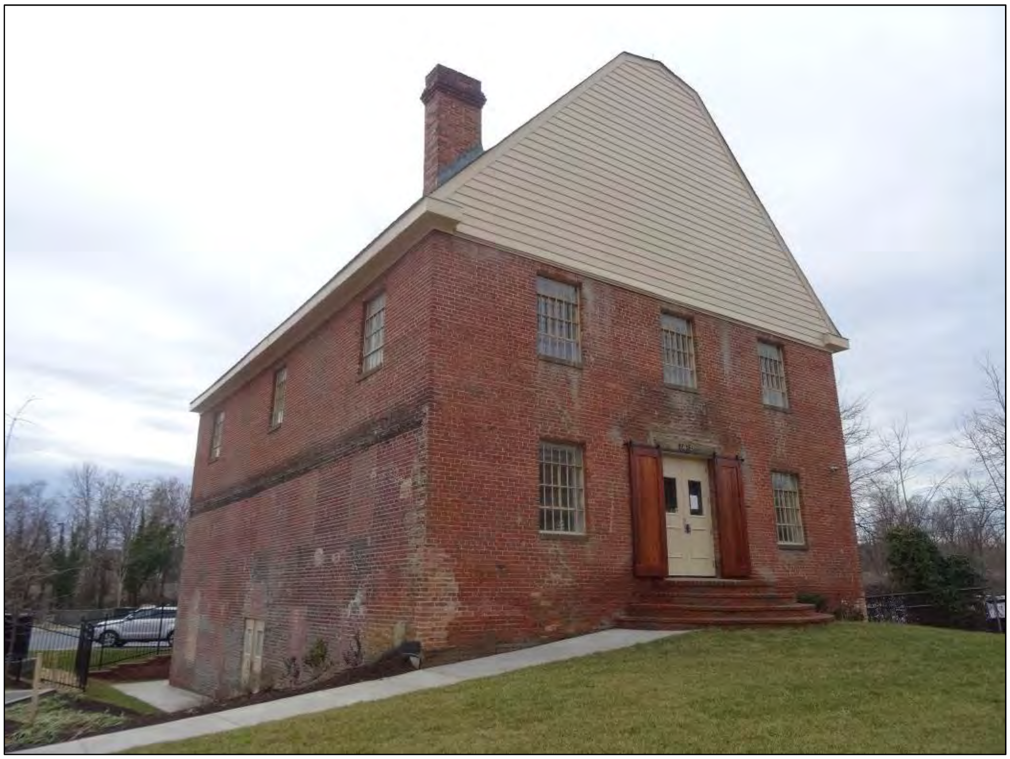

FIGURE 3-7: NORTHEAST OBLIQUE

The primary entrance, centered on the façade (north elevation), is filled with a double-leaf, metal, paneled door with a single light with decorative overhead track wooden sliding doors. A wood lintel is situated above the entry. Other fenestration includes twentieth-century, metal-frame windows consisting of a 12-light, hopper window with six-light, fixed windows set above and below (Figure 3-9). All windows feature brick sills composed of headers. Ghosts of window openings are visible on what is now the first floor of the east elevation. A set of rounded brick steps provide access to the primary entrance. A one-story addition at one time extended from the east and south elevations of the building but was demolished circa 2016 (Nationwide Environmental Title Research [NETR] 2016). A scar from the former addition is visible between the first and second stories (Figure 3-10).

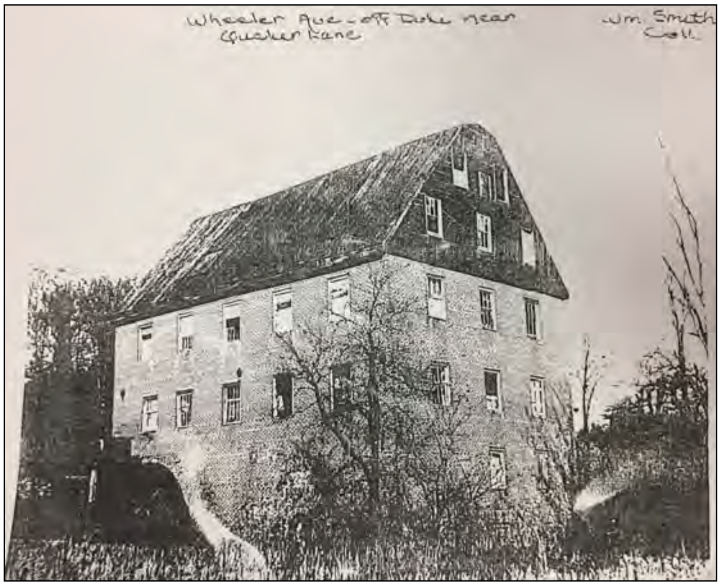

FIGURE 3-8: UNDATED IMAGE OF THE PHOENIX MILL (ALEXANDRIA LIBRARY: SPECIAL COLLECTIONS RECORD N.D.)

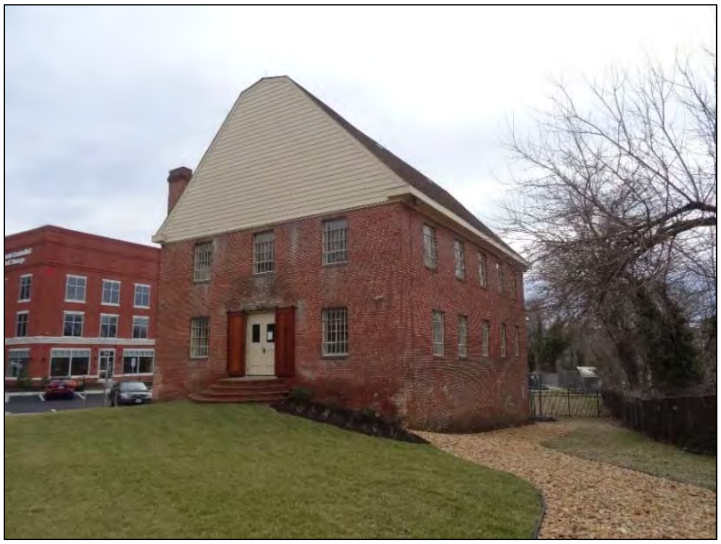

FIGURE 3-9: NORTHWEST OBLIQUE

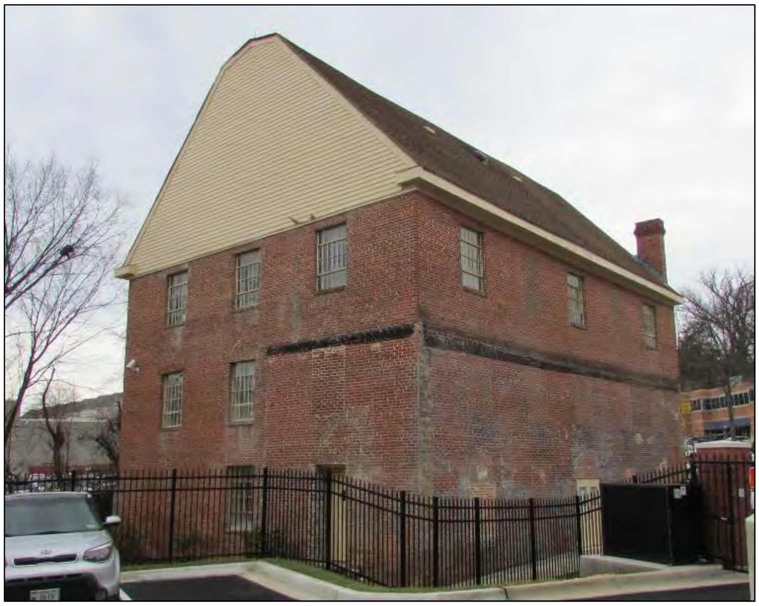

FIGURE 3-10: SOUTHEAST OBLIQUE

3.1.2.2 Primary Resource Interior

The first story of the original circa-1780 core has an open plan (Figure 3-11). The flooring is covered by poured concrete, and the ceiling is open, exposing mortise-and-tenon framing. Throughout the building, exposed framing members at all floors are ornamented by chamfered edges with support posts dividing much of the interior space into thirds along a north-south axis. On the first floor, the interior space has been left open (Figure 3-12). The ghost of a former staircase is partially visible on the northern portion of the east wall. In the northeast corner a fireplace has been filled in; there are no fireplaces in the building today. At the time of survey, electrical wiring was exposed in the ceiling of the first story, as was plumbing.

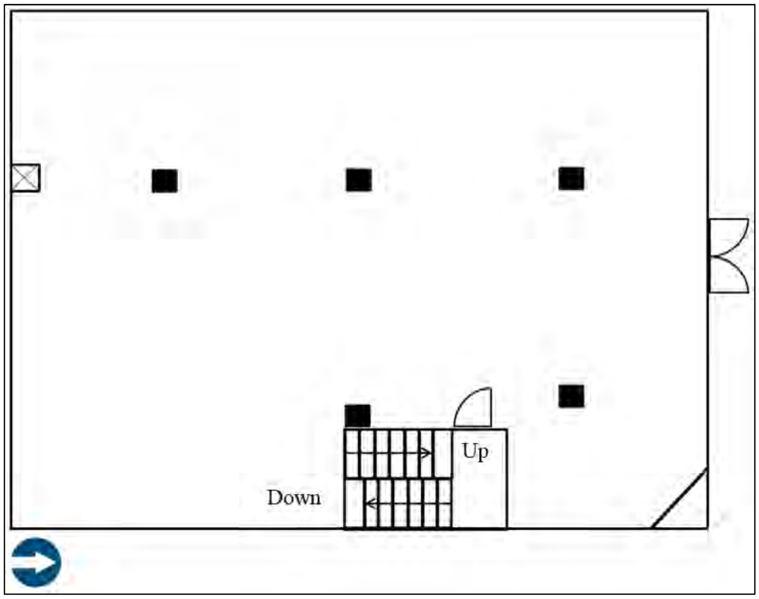

FIGURE 3-11: FIRST STORY PLAN (NOT TO SCALE)

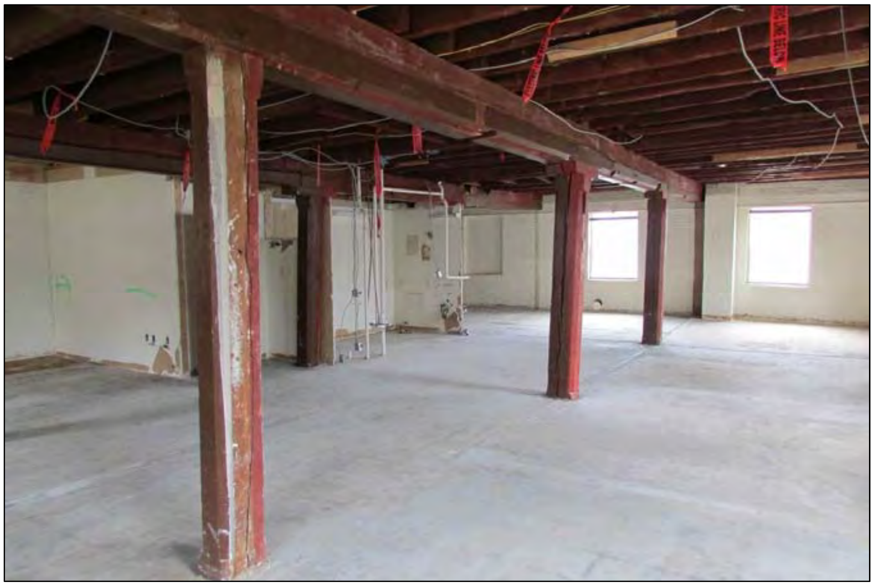

FIGURE 3-12: FIRST STORY INTERIOR, FACING SOUTHEAST

Access to the basement and second story is provided through a partially enclosed, drywalled stairwell, centrally located on the eastern wall. The interior of the second story has been partitioned into offices with drywall inserted between the support posts up to the joists, creating nine rooms around a central common space (Figures 3-13 and 3-14). It has a drop ceiling; the panels were mostly absent and the ceiling rafters and wiring are exposed. Interior brick walls are exposed along the north, east, south, and west interior elevations. All interior fixtures on the second story are modern.

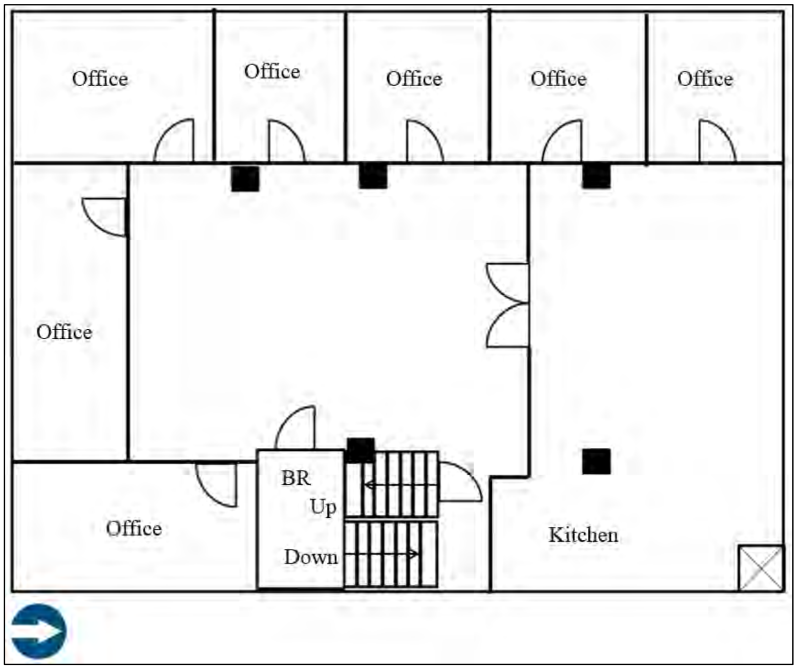

FIGURE 3-13: SECOND STORY PLAN (NOT TO SCALE)

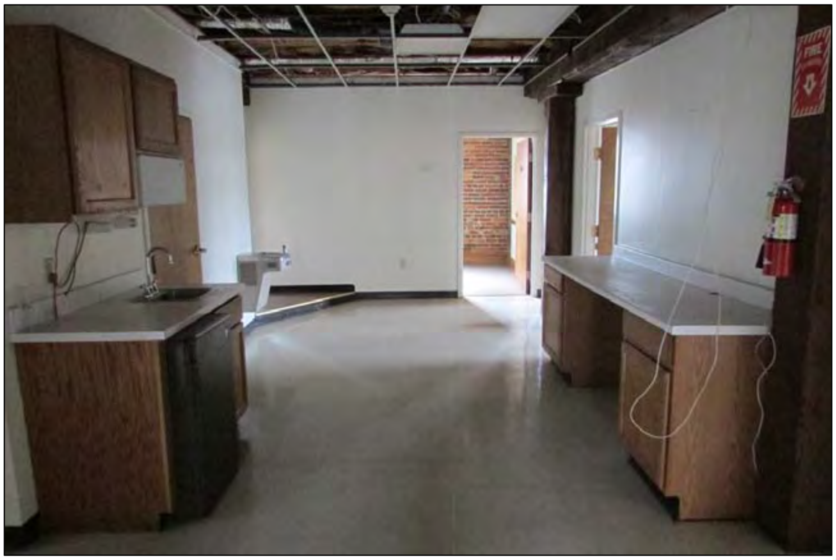

FIGURE 3-14: SECOND STORY INTERIOR, FACING SOUTH

The east-side stairwell also provides access to the third story (Figures 3-15 and 3-16). This space is unfinished and undivided. The floor is covered by plywood. Historic windows on the interior are also covered by plywood. A shaft opening in the floor on the northeast end of the room previously provided space for mill equipment. Ceiling joists show notching indicative of previous room configurations. There is ladder access to the attic in the northeast section of the room. The attic features two flues: one in the northeast corner and a second at the west end of the south elevation, similar to the third-story plan (Figures 3-15 and 3-16). Like the third story, the floor of the attic is covered by plywood sheets. Some roof rafters and sheathing boards appear to be recent replacements while others show evidence of possible fire or smoke damage.

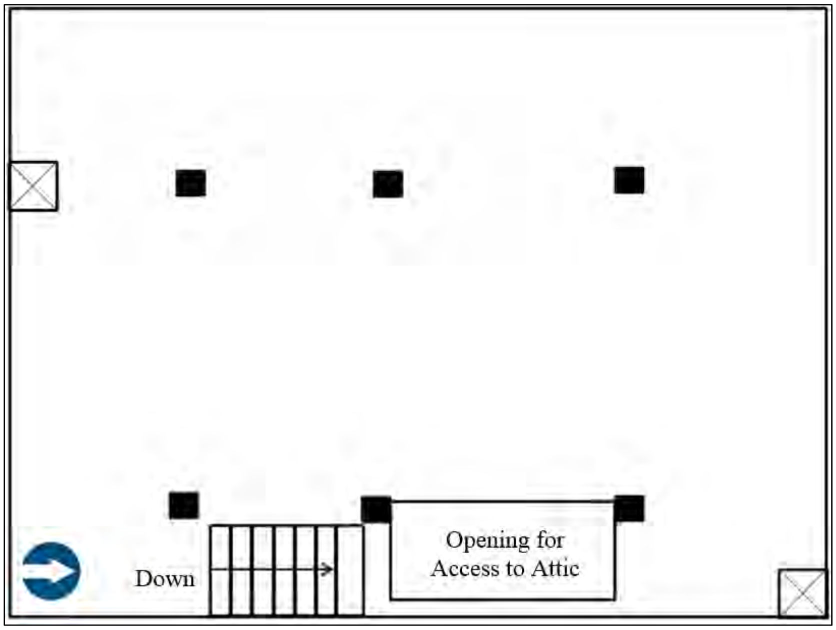

FIGURE 3-15: THIRD STORY PLAN (NOT TO SCALE)

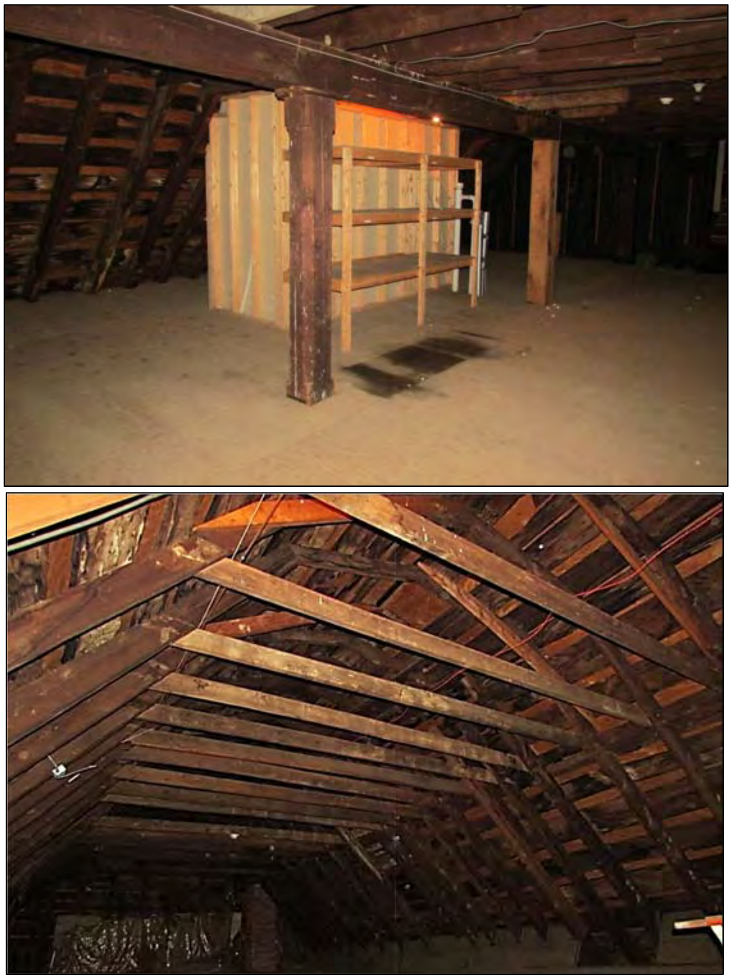

FIGURE 3-16: THIRD STORY INTERIOR, FACING SOUTHEAST (TOP); ROOF STRUCTURAL SYSTEM IN ATTIC, FACING SOUTHWEST (BOTTOM)

The basement is accessed by a stairwell on the east side of the first story and from the exterior by double-leafed metal doors on the east elevation (Figure 3-17). The basement features exposed chamfered support posts, interior drywall walls, and a drop ceiling (Figure 3-18). Shaft marks visible on ceiling joists in the basement are indicative of the use to grist first flour and then corn, most notably activities of the early-twentieth century (Wigglesworth 1975:50) (Figure 3-18). Other beams show indications of equipment attachment and detachment over the years.

A subbasement is accessed by descending stairs on the south elevation of the building (Figure 3-19). At the bottom of the stairwell, an uncoursed stone foundation is visible. Entry to the subbasement was not possible due to flooding; however, support posts, electrical pump equipment, brick walls, and ceiling joists were visible from the stairwell (Figure 3-19).

3.1.3 NRHP Evaluation

The Phoenix Mill, now an office building, at 3640 Wheeler Avenue is a Colonial-era vernacular flour mill constructed sometime after 1777 when George Gilpin petitioned for an acre of land off of Holmes Run to be destined for a mill. It is unclear if the building was constructed immediately; however, it is advertised for sale in the *Alexandria Gazette* in 1812 (Alexandria Gazette 1812). Originally four-stories tall, it currently stands at three as the lower level has been largely buried. Not only are the immediate surroundings of the building significantly altered, but the general area has been heavily suburbanized and developed with a mix of residential neighborhoods and industrial and commercial properties from the large, open agricultural character the area once had. The creek which once powered the mill is no longer a feature of the landscape, and integrity of setting, feeling, and association are negatively impacted by the encroaching parking lots of the self-storage facility to the east. Therefore, the boundaries of the property were currently reduced from the 2016 reconnaissance study to include the mill building and immediate landscaping, excluding the parking lots to the east and south and the self-storage building to the east.

Though it has undergone a number of interior and exterior changes over time, the core of the original building remains intact and in generally good condition. The exterior displays good integrity of workmanship and materials. Additionally, the gambrel roof line is original to the building's construction (Lundegard 2009:22). Changes to the mill's interior have also been made over the years; however, elements still remain reflecting the building's industrial purpose. Original chamfered timbers are visible at every level of the building. The locations of the original grist stones are still visible in the basement along the west wall, though other machinery remnants date to the early-twentieth century. The framing of the building is original to its construction, and the modifications to the floorplan reflect utilitarian use over time.

The Phoenix Mill is the only recorded mill with the DHR in the City of Alexandria, while eight are recorded in the neighboring Fairfax County. Three of these mills are listed in the NRHP and VLR (029-0008, 029-0064, and 029-0330). The Colvin's Mill (029-0008), constructed around 1810, is a four-story brick flour mill building repaired around 1969 and 1975 (David 1976). The mill was continuously used from its conception to around World War II, and in 1965 the Fairfax County Park Authority acquired the building through condemnation. Similar to the Phoenix Mill, the masonry building is covered by a front-gabled roof and has a symmetrical façade; however, through restorations and repairs, including a modern oak waterwheel, Colvin's Mill is now in very good condition. The mill and associated resources are still owned by the Fairfax County Park Authority and operate as a historic park. George Washington's Grist Mill (029-0330) is a 1930s reconstruction of the 1770s mill based on archaeological findings at Mount Vernon Plantation. Though the mill demonstrates the eighteenth-century techniques for milling flour, only archaeological material dates to the period of significance. The interior vertical supports at George Washington's Grist Mill have similar chamfering to those at Phoenix Mill. Hope Park Mill (029-0064) is a three-story, frame, grist mill on a high-stone foundation built between 1790 and 1804, with heavy modification to the interior in the twentieth century.

The resource retains a moderate to high level of integrity in design, location, and workmanship, and a sufficient integrity of materials to merit NRHP-eligibility consideration. The Phoenix Mill was constructed in the late-eighteenth century and remained in service as mill operation through the twentieth century. There are no surviving brick mill buildings within the City of Alexandria; additionally, the mills recommended eligible for the NRHP in Fairfax County also have significant interior modifications. Therefore, the resource is recommended as locally significant under Criterion A as representative of the significance of mills in eighteenth- and nineteenth-century manufacturing. The resource is not known to be associated with a significant person from history and because of this, it is recommended not eligible under Criterion B. The Phoenix Mill is a unique example of an eighteenth-century, brick grist mill in the City of Alexandria. As such, it is also recommended as locally significant under Criterion C for architecture. As an architectural resource, it was not evaluated under Criterion D.

In sum, the Phoenix Mill is **recommended as eligible at the local level under Criterion A and Criterion C.**

The recommended period of significance for the Phoenix Mill begins with its construction date of around 1780 until it ceased to be used as a mill in approximately 1958. The proposed NRHP boundary for the Phoenix Mill at 3640 Wheeler Avenue follows the immediate landscaping contained within the paved parking lots to the east, west, and south of the mill building, and Wheeler Avenue to the north (Figure 3-20). The proposed boundary includes only the mill building and the contemporary French drain.

3.2 HANNAH P. CLARK HOUSE/ ENYEDI HOUSE (029-5741)

The Hannah P. Clark House, also known as the Enyedi House, is located at 10605 Furnace Road in Lorton in Fairfax County, Virginia (Figure 3-21). The resource, situated on a 10.85-acre tract, is situated within the Old Colchester Park and Preserve run by the Fairfax County Park Authority (FCPA) (Fairfax County, Virginia 2018). The lot is primarily covered with matured coniferous and deciduous trees with the buildings concentrated in the southwest half of the property. The tract is positioned at the northeast corner of Furnace Road and Old Colchester Road, immediately northeast of the historic port town of Colchester Town (029-0042). The property is accessed by an unpaved driveway extending from Furnace Road towards the building complex and circles around an overgrown shrub. A brick walkway lined with shrubbery and trees leads from the driveway towards the dwelling. A wood lattice fence extends southeast from the south elevation of the dwelling. An additional stone walkway extends from the driveway towards an enclosed porch on the southwest elevation of the dwelling. Associated with the residence is a circa-1987 studio and shed, concrete capped well, and circa-1920 RF&P Railroad shed.

3.2.1 Historic Context

A detailed history of the occupation of the Hannah Clark house has previously been completed by Elizabeth Peebles of the Fairfax County Park Authority as part of a Historic Structure Assessment (2014). Therefore, this historic context only summarizes the ownership history of the building and land; for further detail on the history of the structure or its occupations, Elizabeth Peebles' *Historic Structure Assessment* should be consulted (2014).

The land on which the house is located was part of a tract that originally adjoined the historic Colchester Town, chartered in 1754 (Sprouse 1975:19–23). Colchester Town had its beginnings as the location of an important ferry landing along the Occoquan River, but soon grew as a commercial center during the latter half of the eighteenth century (Sprouse 1975:19–55). However, by the early-nineteenth century, the town was defunct and many of the lots were abandoned, with the surrounding land part of large farms (Sprouse 1975:110). One of these farms, totaling 376 acres and including the land on which the Hannah P. Clark house would be built, was purchased by James Potter and John Allison in 1839 (Fairfax County Deed Book [FCDB] R3:147). By the time of his death, in 1865, Potter had amassed 213 contiguous acres bordering Colchester Town, in addition to as many as 15 town lots (Figure 3-22) (Fairfax County Land Tax Records [FCLTR] 1857; Peebles 2014:12–13). In his will, Potter left his personal estate to his three children, Hannah, Cornelius, and Joseph, while his land was split only between his two sons. James Potter's common law wife and mother of his children, Barbara Beach, was named the executrix of his estate (Fairfax County Will Book [FCWB] 1865:448).

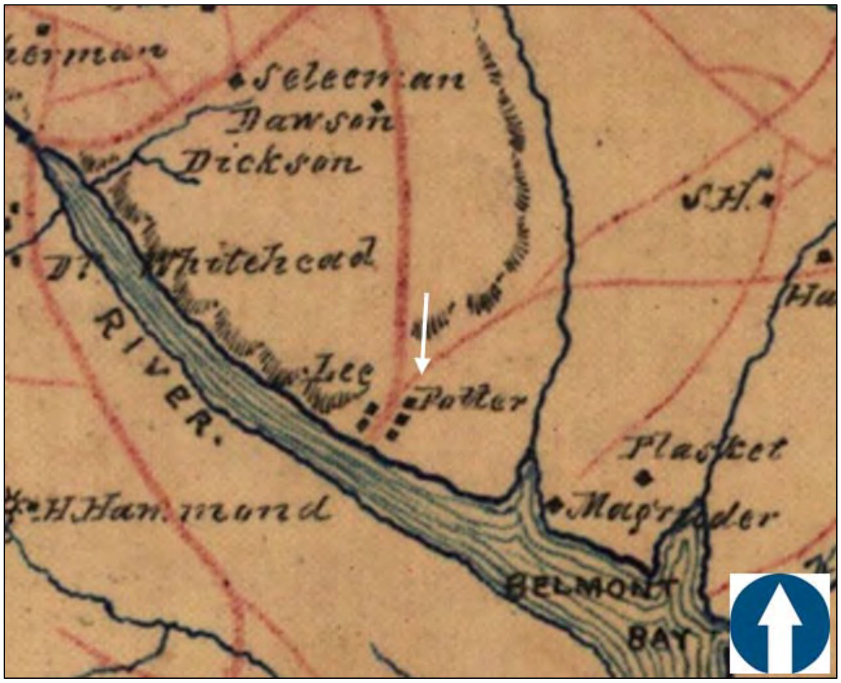

FIGURE 3-22: 1864 MAP SHOWING LOCATION OF JAMES POTTER'S FARM, DENOTED BY WHITE ARROW (HOFFMAN AND BROWN 1864)

On December 12, 1865, Hannah Potter married James Clark in Washington, D.C. (Peebles 2014:16). In 1867, Hannah brought an injunction against Barbara Beach for mishandling her father's estate and not following the terms of James Potter's will. However, before this action went to court, Barbara died, leaving Robert Wiley as the administrator for both Potter's and Beach's estates. By 1874, due to the death of his brother, Cornelius, Joseph Potter became the sole heir to the Potter farm (Sprouse and Mitchell 1996:1570). In 1876, Joseph Potter and his wife, Emma Weston, sold the northern 65 acres of the property to Hannah Clark (Figures 3-23 and 3-24). Hannah also purchased a 2.33-acre tract across Ox Road from her larger parcel in the same year. The signing of two promissory notes by Hannah Clark at the same time as she purchased the land indicates that she likely began construction of her house on the 2.33-acre parcel sometime around 1876 (FCDB X4:238).

Hannah and James Clark had four children who survived to adulthood, Cornelius Franklin, Charles Augustus, Sallie, and Samuel, all of whom were born before their house on Ox Road was constructed (Peebles 2014:19). After the construction of the house, it appears that the Clarks made a living as subsistence farmers, based on the 1880 agricultural schedule (United States Federal Population Census [U.S. Census] 1880). In 1887, James Clark moved out of the house permanently, due to marital problems between him and Hannah (Fairfax County Chancery Case 1893). As a result of the divorce, Hannah was awarded all of the real and personal property, as well as custody of the minor children. Hannah became the first woman to successfully sue and divorce her husband in the area (FCPA 2014).

By 1900, the RF&P Railroad began to encroach on Hannah Clark's property on both sides of Ox Road. During the course of the first decade of the twentieth century, the railroad improved and realigned the section of track that bordered Hannah's property, causing small sections to be taken by the railroad. In 1913, the RF&P Railroad again elected to realign and improve the track, taking the 2.33-acre parcel on which Hannah Clark's house was located (FCDB 1913 P7:425). Due to the taking of her parcel by the railroad, Hannah decided to move her house to her land across Ox Road, where she then resided until her death in 1925 (Peebles 2014:33–36).

Hannah left the majority of her property, including her house and 41 acres surrounding it, to her youngest son, Samuel (FCWB 10:448). Samuel lived elsewhere and likely rented the house until he sold it and 13.35 acres surrounding it to the RF&P Railroad in 1931. During the 1930s and 1940s, Bennie Purks, a section manager for the RF&P Railroad, and his family lived in the house until his death in 1943. In that same year, Charles T. Clark, the grandson of Hannah Clark, was promoted to section foreman for the railroad and moved into the Hannah Clark house with his family (Peebles 2014:44). In 1946, Charles purchased the house and surrounding 12.88 acres (Figure 3-25). Finally, in 1956, Clark sold the house and approximately 10 acres that surrounded it to the Harbor Bay Corporation, owned by real estate developer Andrew W. Clarke, ending the Clark family ownership of the house (FCDB 1429:320).

FIGURE 3-25: DETAIL OF THE 1946 REVISION OF THE 1931 RF&P RAILROAD SURVEY SHOWING THE HANNAH CLARK HOUSE (FCDB Y10:53; PEEBLES 2014:44)

Andrew Clarke died in 1968 before the property could be developed, leaving his widow, Margaret, and the First Virginia Bank to sell the parcel to Timberlake McCue, another Northern Virginia real estate developer in 1969 (FCDB 3260:360). In 1975, McCue subdivided an approximately 1.5-acre parcel that surrounded the house. Soon after, McCue died and the property was sold to the McCue Limited Partnership in 1980, who then sold it to Thomas and Patricia Lewis in 1983 (FCDB 5826:593). Prior to the 1983 sale of the property to the Lewis's, the house had been a rental property for 27 years. The Lewis's did not remain in the house for long, however, selling it to Janos and Diana Enyedi in 1986 (FCDB 6545:1978).

Janos Enyedi (1947-2011) was an industrial sculptor, photographer, and mixed media artist who gained international notoriety for his work that focused on America's twentieth-century industrial landscape. His interest in America's rust belt and his status as the grandson of Hungarian immigrants blend together in his interpretation of rural and urban working landscapes. His work is associated with the late Precisionist style exemplified by the work of Charles Sheeler, and is closely related to Futurism, Cubism, and other European modern styles (Metropolitan Museum of Art 2007, Washington Post 2011). His work has been exhibited in museums, embassies, and corporate collections around the world, and his increasing success required the construction and expansion of a studio on the Hannah Clark property soon after the Enyedis moved in (Peebles 2014:53). The Enyedis referred to his workspace on the Hannah Clark property as the Furnace Road Studio. Janos and his wife, Diana, lived in the Hannah Clark house until 2011 when they sold the property to the FCPA and moved to St. Petersburg, Florida, to join an artist community (FCDB 21616:102). Janos Enyedi died shortly after their move. Since 2006, the FCPA has been acquiring land in and around Colchester Town to create the Old Colchester Park and Preserve (Peebles 2014:56). Currently, the Hannah Clark house is part of this park, and the FCPA has started to take steps to preserve this building (FCPA 2014).

3.2.2 Architectural Description

3.2.2.1 Primary Resource Exterior

The property's primary resource is a two-story, four-bay, single-family dwelling constructed in 1839 in a vernacular gable-and-wing form (Figure 3-26). According to the owner and a FCPA architectural historian, the earliest portion of the building was constructed with vertical logs; however, this was not apparent during the current inspection (FCPA 2014). The continuous brick foundation is parged and supports a frame structure clad in weatherboard siding with wood corner boards (Figure 3-27). The moderately pitched, cross-gabled roof is clad in asphalt shingles with boxed eaves featuring a simple wood cornice with partial eave returns. An exterior-end chimney clad in weatherboard siding is centered on the northeast elevation, and an exterior metal flue protrudes from the first story of the northwest elevation of the core of the building.

The current primary entrance, filled with a single-leaf, paneled, wood door covered by a wood screen door, is situated on the southeast elevation of a one-story, shed addition on the rear (southeast) elevation of the building. Another entrance is located on an enclosed porch that spans the northwest elevation (Figure 3-28). This entrance is filled by a single-leaf, wood, paneled door covered by a metal-framed screen door and accessed by a set of concrete steps. The porch is clad in weatherboard siding and covered by a hipped roof sheathed in asphalt shingles. It features two six-over-six, wood-frame, double-hung-sash windows and one fixed six-light window. Other fenestration includes six-over-six, wood-frame, double-hung-sash windows, most of which are flanked by fixed, wood, louvered shutters. Located on the northeast elevation flanking the chimney are narrow, single-leaf, multi-light, doors accessed by a full-width, wood deck with wood steps.

Two one-story additions extend from the southeast elevation: an enclosed porch containing the current primary entrance and an enclosed sun room (Figure 3-27 and Figure 3-28). The entry porch is covered by a shed roof and was built sometime between 1890 and 1940 (Peebles 2014: 30). The sun room is covered by a hipped roof and features floor-to-ceiling, multi-light windows. This addition was built in the same phase as the entry porch between 1890 and 1940, and enclosed in the 1980s during the Enyedi ownership (Peebles 2014:49).

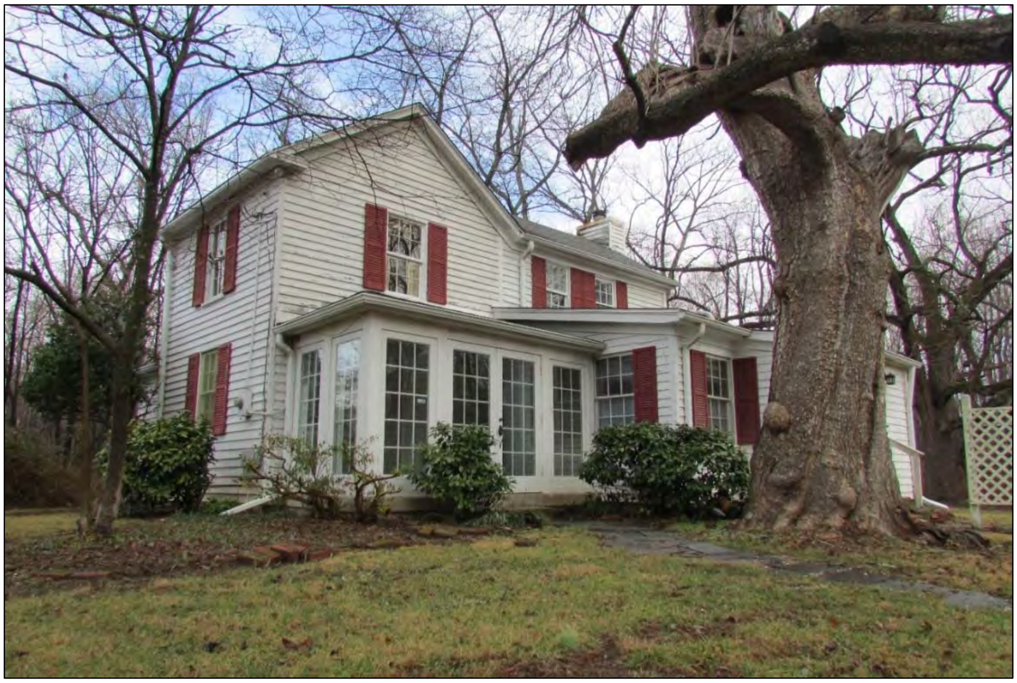

FIGURE 3-27: SOUTH OBLIQUE OF THE HANNAH P. CLARK HOUSE

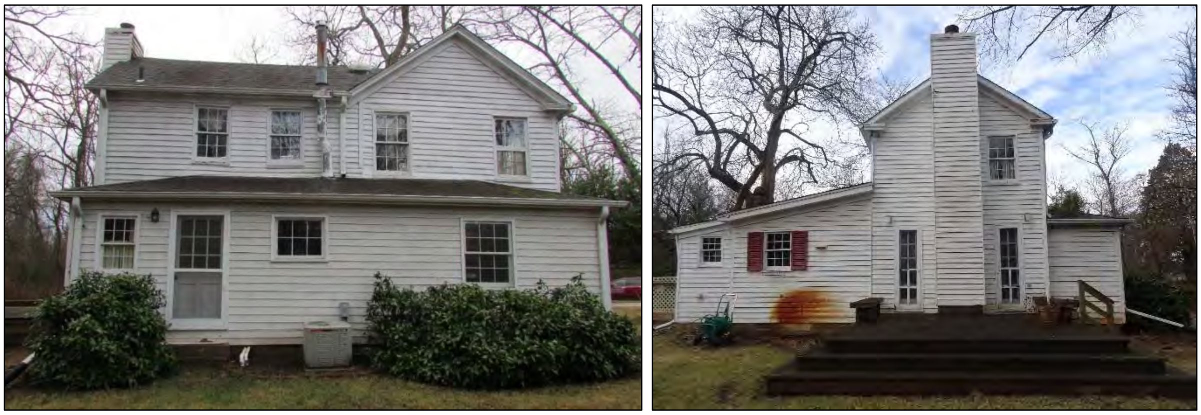

FIGURE 3-28: NORTHWEST ELEVATION (LEFT); NORTHEAST ELEVATION (RIGHT)

3.2.2.2 Primary Resource Interior

Access to the interior of the property was not permitted. Peeble's 2014 *Historic Structure Assessment*, details the interior arrangement and speculates on the development of the house. Though the exact dates of each building periods are unknown, the core of the house was built as a two–story dwelling with one room on each floor. This section was built as a log structure and no longer rests on its original foundation.

3.2.2.3 Secondary Resources

A circa-1987, one-story, three-bay, shed/studio is located southeast of the dwelling (Figure 3-29). It sits on a continuous concrete foundation while its structural system is clad in snap-on, batten with clip, metal siding. The front-gabled roof is sheathed in corrugated metal. Fenestration includes a single-leaf, metal, pedestrian door; a large, double-leaf, sliding metal door; and sliding metal windows. A one-story shed addition extends from the northeast elevation and is clad in T1-11 siding. A set of double-leaf, T1-11 doors and a three-light transom mark its northwest elevation. A one-story, one-bay, prefabricated shed constructed around 2000 is located immediately south of the studio (Figure 3-29). It is clad in T1-11 siding and covered by a front-gabled roof. A double-leaf, board-and-batten door is located on the northeast elevation. A circa-1980, concrete well superstructure is located east of the primary resource (Figure 3-30). It is covered by a circular concrete well cap. An additional one-story, one-bay shed of frame construction with vertical wood siding is located northeast of the primary dwelling (Figure 3-31). A single-leaf, five-panel, wood door is located on the southwest elevation. The roof and southeast elevation are dilapidated and the structure is in poor condition. The shed was possibly used by railroad foreman associated with the RF&P Railroad and was built between 1925 and 1943 (Peebles 2014:124).

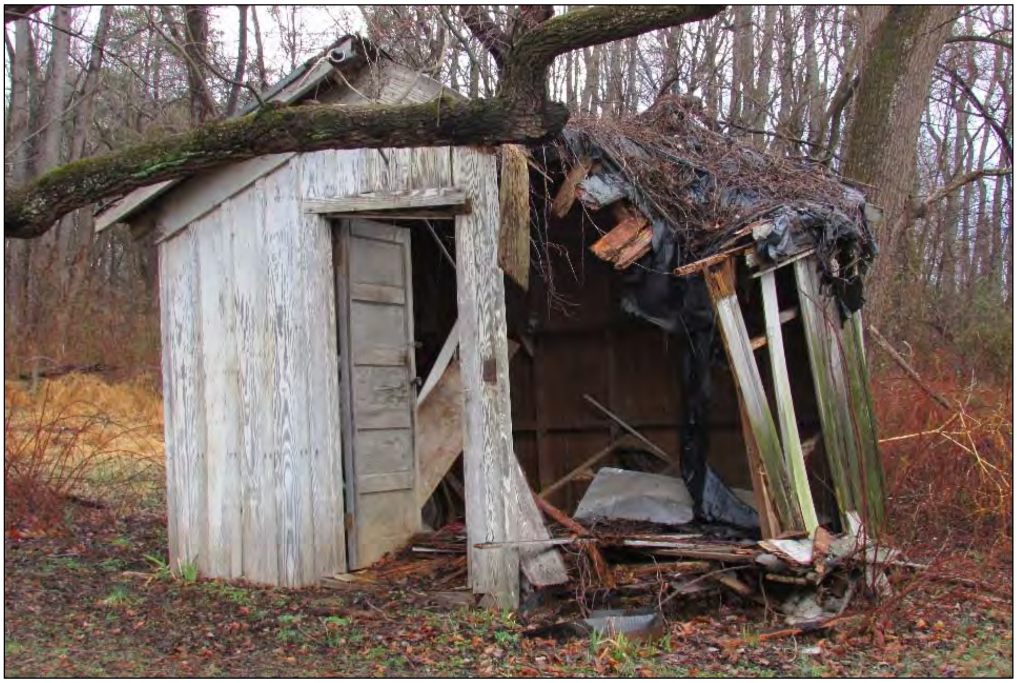

FIGURE 3-31: SOUTH OBLIQUE VIEW OF RAILROAD SHED. NOTE: THE DILAPIDATION OF THE NORTHEAST ELEVATION

3.2.3 NRHP Evaluation

The Hannah P. Clark/Enyedi House is associated with long-time area residents, Hannah P. Clark and the Potter family, and with an internationally known artist, Janos Enyedi, who lived and worked at the house until his death in 2011. The primary resource, the dwelling itself, is believed to be a rare surviving example of log construction; however, the building is enclosed in modern materials with additions and is known to have been moved, albeit a short distance. For these reasons, the resource retains a moderate to low level of historic integrity of location, materials, design, and workmanship. The absence of any associated outbuildings related to the occupation of the Clark family in the nineteenth and early-twentieth century further diminishes its historic integrity of setting and feeling. The studio building, linked to Enyedi's period of occupation, does assist the resource in retaining an adequate level of significance of association and setting during the resource's period of significance (1986–2011).

In order for a resource to be considered eligible for the NRHP under Criterion A, "a property can be associated with either (or both) of two types of events: […] a specific event marking an important moment in American prehistory or history [or] a pattern of events or a historic trend that made a significant contribution to the development of a community, a state, or the nation" (Shrimpton et al. 1990). The Hannah P. Clark/Enyedi House has no known association with a notable historic event or trend. As such, it is recommended not eligible for listing in the NRHP under Criterion A.

Eligibility of a resource for the NRHP under Criterion B is defined as needing to be associated with a person who is "individually significant within a historic context" and has "gained importance within his or her profession or group" (Shrimpton et al. 1990). Additional guidance for NRHP eligibility under Criterion B indicates that "Eligible properties generally are those associated with the productive life of the individual in the field in which (s)he achieved significance" (Bolland n.d.). The dwelling is associated with the Potter and Clark families, and Hannah P. Clark was the first divorced woman to own property in the area, though this does not warrant recommendation for eligibility under Criterion B. However, the internationally renowned artist, Janos Enyedi, used the property for his residence and art production that celebrated industrial landscapes in the United States and Europe for 24 years (Peebles 2014: 53).

Although the dwelling had been moved from its original location, northwest of the current site on the west side of Furnace Road, it is still within the vicinity of Colchester Town and on land that did formerly belong to Hannah P. Clark's father's farm. Under Criteria Consideration G, properties over 50 years of age, but with a period of significance of under 50 years, can be eligible if the occupant was of exceptional importance. Janos Enyedi did not occupy the dwelling until the late 1980s; however, his success and accomplishments in the international art world warrants the property to be eligible despite the recent nature of his occupation. His Furnace Road studio, occupied for 24 years, was the site of his most prolific period, and the period in his career during which his work was most widely exhibited (Furnace Road Studio n.d.). Though Enyedi's collection is housed and posthumously displayed in St. Petersburg, Florida, the Hannah P. Clark/Enyedi House is the most relevant existing building associated with his life and work. Furthermore, there are no other identified examples of an internationally recognized industrial artist's studio in Fairfax County, nor in the surrounding counties. For these reasons, the resource is recommended eligible for listing in the NRHP under Criterion B due to the strong association with Janos Enyedi as the location of his studio from 1986 to 2011. The resource is also eligible under Criteria Consideration B for a moved property, as the period of significance recommended occurs in the period after the relocation of the property, and Criteria Consideration G for significance of less than 50 years.

The resource has been modified by multiple additions and alterations, negatively impacting its historic integrity of materials, design, and workmanship. As such, it is recommended not eligible under Criterion C. As an architectural resource, it was not evaluated under Criterion D.

In sum, the Hannah P. Clark/Enyedi House is **recommended as eligible at the local level under Criterion B for its association with Janos Enyedi and under Criteria Consideration B for a moved property and Criteria Consideration G for significance of less than 50 years.**

The period of significance for the Hannah P. Clark/Enyedi House begins with the property's association with Janos Enyedi, 1986–2011, as outlined previously. The proposed NHRP boundary for the Hannah P. Clark/Enyedi House at 10605 Furnace Road in Lorton in Fairfax County, Virginia comprises and follows the legal lot description for the parcel in its entirety (Parcel ID 1133 01 0019A). It is bounded by Furnace Road on the southwest and Old Colchester Road on the southeast, and parcel 1133 01 0019 to the north and west. The proposed boundaries include the primary dwelling, circa-1987 studio and shed, and concrete well. These boundaries do not include the railroad shed, located in parcel 1133 01 0019.

3.3 JACKSON SHRINE (016-0092)

The Jackson Shrine is a historic commemorative complex located at 12019 Stonewall Jackson Road in Caroline County, Virginia. The resource is located within the Fredericksburg and Spotsylvania National Military Park near the small village of Guinea—once a station stop along the RF&P Railroad—which bounds the property on the southwest (Figure 3-33). The resource contains roughly 20.5 acres of land largely consisting of an open clearing bounded by woods on the northwest, northeast, and southeast (Caroline County 2018). It is accessed via a 1,900-foot long poured-concrete driveway extending northwest from Stonewell Jackson Road, also known as Route 606, which terminates in a loop with adjacent parking spaces.

The property centers on the 1828 office building at Fairfield Plantation where General Thomas Jonathan “Stonewall” Jackson died in May 1863, but also includes other architectural and landscape features such as the below-ground remains of the Chandler House Site; a reconstructed wellhead; a 1903 granite memorial; several informational panels located adjacent to a parking area; a drinking fountain; restroom facility; and a private residence referred to as the caretaker’s house with an associated storage shed. The property has been managed by the National Park Service (NPS) since 1936.

3.3.1 Historic Context

The land within the Jackson Shrine property was part of a 753.5-acre parcel owned by Thomas Coleman Chandler at the time of the Civil War. Established in the late-eighteenth century by John Thorton, Fairfield Plantation was purchased by Chandler at auction in 1845 from the estate of Thorton’s widow, containing the house where they had both resided prior to their deaths in 1844 and 1845, respectively, and excluding 1 acre of land for the family cemetery (Happel 1961:9–11). Thomas Chandler married Clementina S. Alsop, daughter of a very wealthy Spotsylvania planter, in 1825, and she bore five children before her death in 1844. Shortly before moving to Fairfield, Chandler remarried to Mary Elizabeth Fraser (Happel 1961:14).

Thomas and Clementina’s son, John Alsop Chandler, graduated from medical school in Philadelphia and briefly used the office at Fairfield as a medical practice, but this building also served as an office for the larger farm property (Happel 1961:16–17). Chandler expanded upon the 1828 office building in the 1850s to accommodate an increasing number of duties on his plantation, including the medical care his eldest son provided at the farm on occasion. Prior to the war in 1861, the Chandler family land holdings, including those of several children who owned adjacent parcels, were substantial—totaling 2,574 acres—and worked more than 38 enslaved people over the age of 12 (Figure 3-34) (Happel 1961:17–21). Thomas Chandler resided and owned Fairfield during much of the Civil War, but had entered into an agreement to sell the property to local physician Edgar McKenney in 1863. Archival research indicates, however, that this transaction was not formalized until March 1865, and Chandler continued to pay taxes on the property (Happel 1961:22).

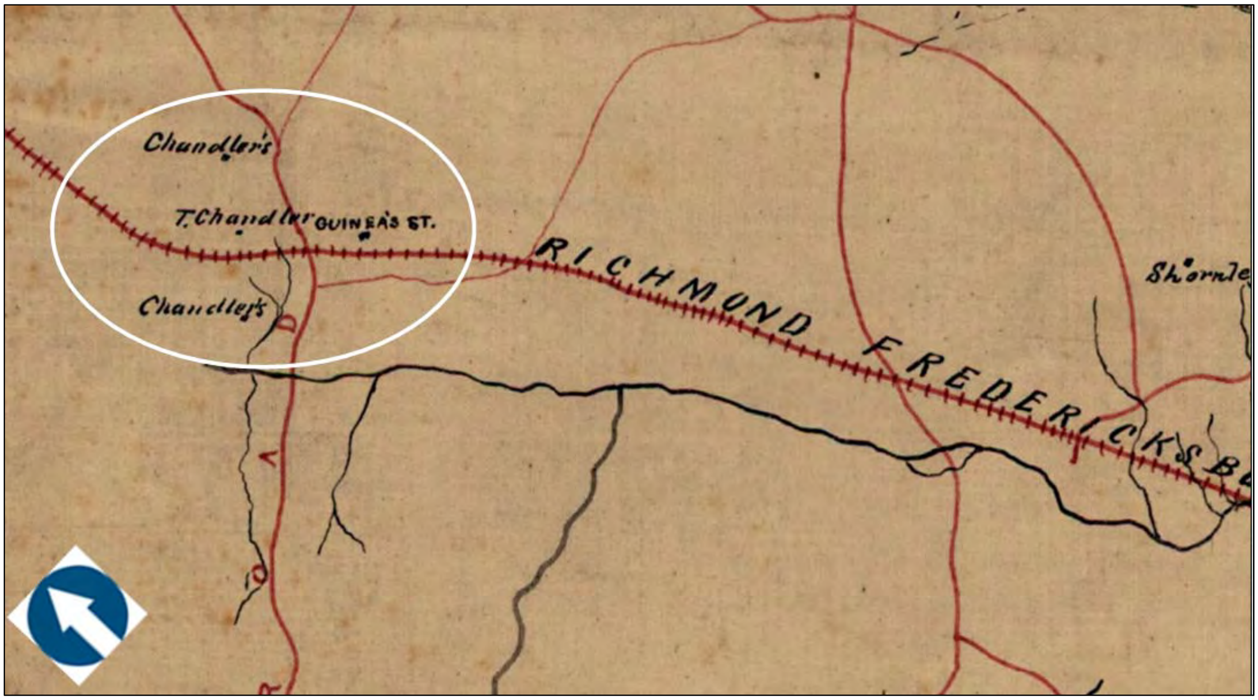

FIGURE 3-34: DETAIL OF "MAP OF CAROLINE COUNTY" SHOWING CHANDLER PROPERTY (CIRCLED IN WHITE) NEAR GUINEA STATION (CAMPBELL AND GILMER 1862) (MAP NOT TO SCALE)

On May 4, 1863, Confederate General Thomas Jonathan "Stonewall" Jackson was brought to Fairfield after being wounded by friendly fire at the Battle of Chancellorsville and died in the plantation office six days later. "The office stood bare, except for a few items in storage, when Jackson's ambulance arrived. Although offered the use of the Chandler house, Jackson's doctor and staff officers chose the quiet and private outbuilding as the best place for Jackson to rest after his long ambulance ride" (NPS 2015).

Edgar McKenny's widow sold the property out of the family in 1884, and in successive decades, Fairfield plantation was subdivided several times in rapid secession. Twelve deeds recorded between September 1889 and May 1921 conveyed tracts as large as 245 acres and as little as 5 acres in size. By deed of August 1909, J. W. King sold William H. White the 5-acre parcel "upon which is located the house in which General Thomas J. Jackson… died" (Happel 1961:115). The Whites purchased several tracts of Fairfield in the early-twentieth century and sold at least two parcels to the RF&P Railroad near Guinea Station, including the 5-acre parcel with the office building in September 1911 and another neighboring tract in 1921. Sometime after 1911, the Chandler house, a two-story brick dwelling constructed in 1854, burned down. Other lost buildings on the property prior to its sale to the RF&P Railroad included a stable, icehouse, smokehouse, slave quarters, and presumably other agricultural structures (Figure 3-35) (Happel 1961:32–34).

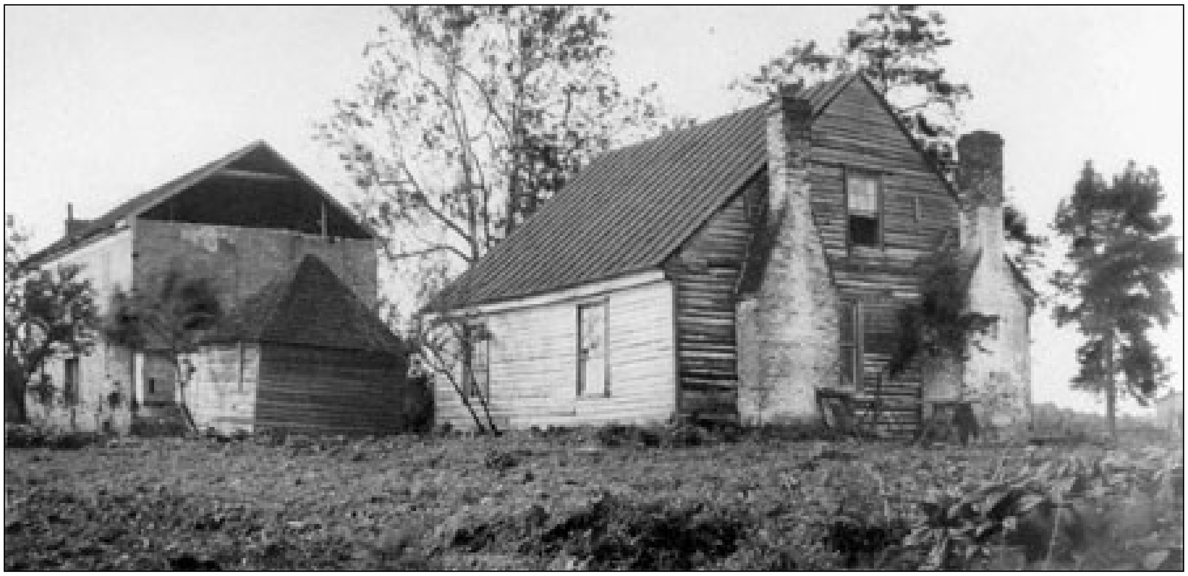

FIGURE 3-35: PHOTO TAKEN BEFORE THE FAIRFIELD PLANTATION WAS DESTROYED BY FIRE IN 1911 (NPS 2015)

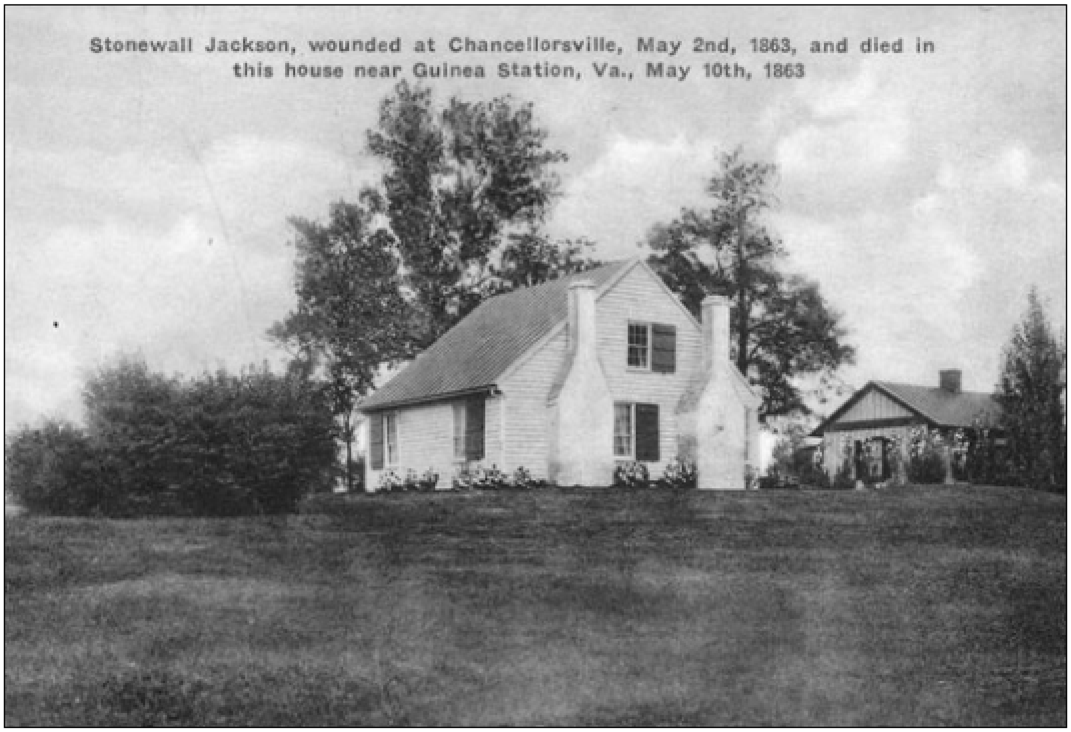
As early as 1907, the RF&P Railroad issued publications advertising the view of the "house in which Stonewall Jackson died" from their trains (Happel 1961:71) (Figure 3-36). Recognizing the historic importance of the property, in January 1936, the RF&P Railroad sold the 5-acre lot to "The United States of America," a transaction approved by the Secretary of the Interior later that year (Happel 1961: 115). The shrine was opened to the public in 1937 and was operated as a historic site in conjunction with the Fredericksburg and Spotsylvania National Military Park (Figure 3-37). Following intensive examination of the property, the NPS undertook a detailed restoration project in 1962 that included rebuilding a rear-lean-to addition (personal communication with NPS staff 2018). After the initial donation of the Jackson Shrine, 10 more parcels were acquired by the NPS between 1963 and 2002 (Brien et al. 2004:255). The Shrine continues to be owned and operated as a unit of the Fredericksburg and Spotsylvania National Military Park. In the 1960s, the NPS created an interpretation plan to restore the building to its appearance a century prior.



Stonewall Jackson, wounded at Chancellorsville, May 2nd, 1863, and died in this house near Guinea Station, Va., May 10th, 1863

3.3.2 Architectural Description

3.3.2.1 Primary Resource Exterior

The primary resource is a one-and-a-half-story, two-bay, office building originally constructed in 1828 and expanded in the 1850s. This resource is located about 400 feet northeast of the railroad tracks (Figure 3-38). It has a continuous brick foundation supporting a frame structural system that is clad in beaded weatherboard with beaded corner boards. The building is covered by a moderately pitched, front-gabled roof sheathed in wood shingles. Two exterior-end brick chimneys mark the southeast elevation.

FIGURE 3-38: DETAILED SITE PLAN OF THE JACKSON SHRINE (GOOGLE EARTH 2018) (NOT TO SCALE)

The primary entrance is located on the northwest elevation and is filled by a single-leaf door of vertical wood boards accessed via a one-story, front-gabled entry porch with wood deck and chamfered wood posts (Figures 3-39 and 3-40). The porch is supported by brick piers. A secondary entrance is located to the west of the primary entrance and is filled with a similar single-leaf door of vertical wood boards, with concrete steps. Fenestration on the northeast and southwest elevations include nine-over-six, double-hung-sash, wood windows flanked by board-and-batten shutters. A six-over-six, double-hung-sash, wood-framed window with thin muntins is centrally placed in the gable ends.

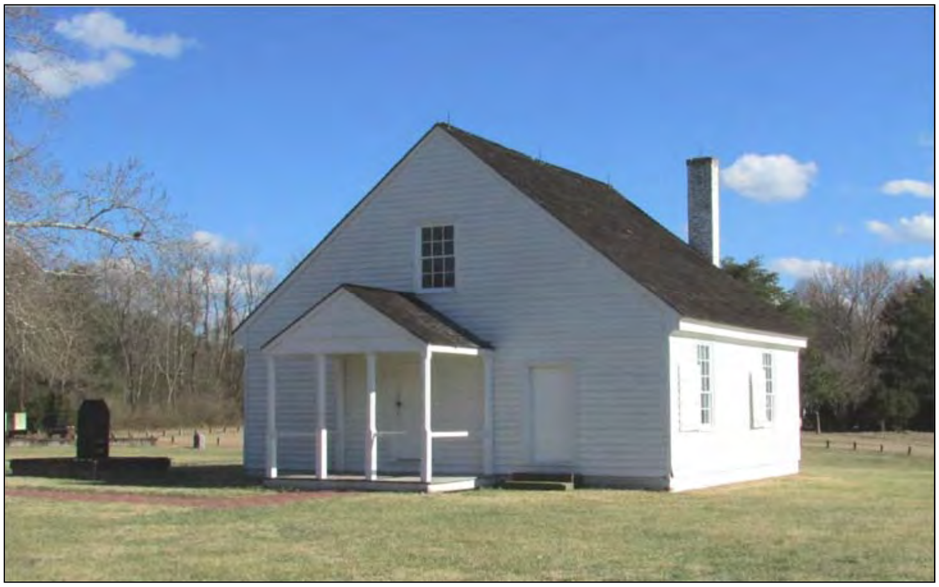

FIGURE 3-39: WEST OBLIQUE OF SHRINE BUILDING

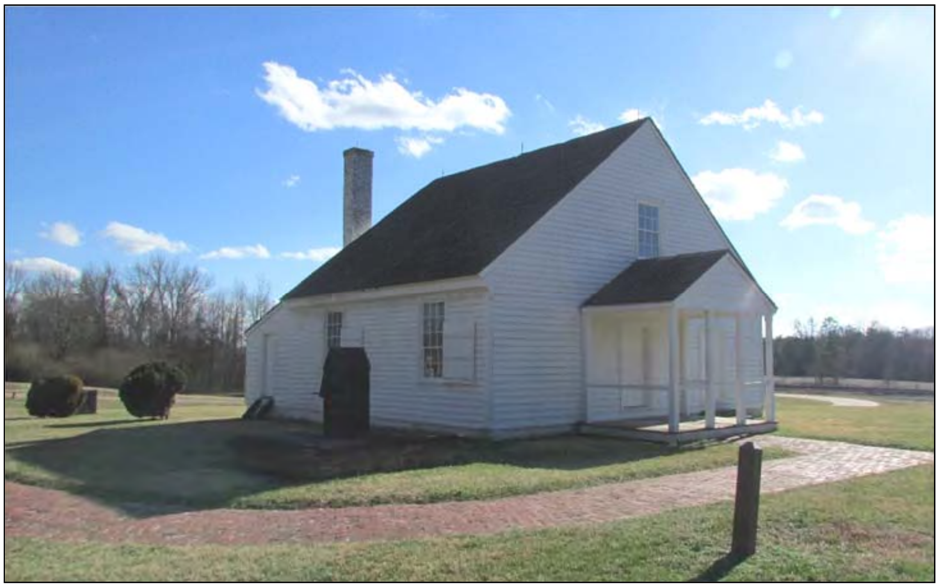

FIGURE 3-40: NORTH OBLIQUE OF SHRINE BUILDING

A one-story, lean-to addition with a shed roof lines much of the southeast elevation (Figure 3-41). This addition is a reconstruction and was added during the 1962 restoration of the property. It is supported by a brick-pier foundation with wood lattice between piers and is clad in beaded weatherboard. A single entrance is located on the northeast elevation and consists of a single-leaf, board-and-batten door accessed by a set of wood steps. Two six-over-six, double-hung-sash, wood windows with board-and-batten shutters mark the southeast elevation.

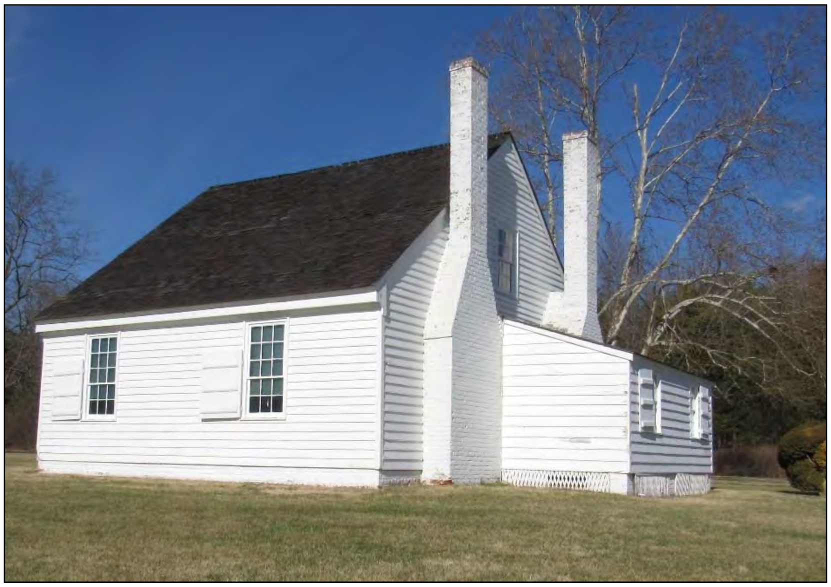

FIGURE 3-41: VIEW OF REAR ADDITION AND EXTERIOR-END BRICK CHIMNEYS, LOOKING NORTH

3.3.2.2 Primary Resource Interior

The interior of the office building was not accessible at the time of survey, but is well documented in a 1961 Historic Structures Report compiled to aid in the restoration of the Jackson Shrine property (Happel 1961). Few modifications have been made to the interior since the restoration work was completed around 1968.

3.3.2.3 Secondary Resources

The site of the Chandler House at Fairfield (44CE0106) is marked by four wood posts, denoting each corner of the dwelling, located northwest of the office building (Figure 3-42). A plaque further designates the location of the site. Further southeast and just 6 feet east of the office building is a reconstructed, nineteenth-century-style wellhead with a mortared fieldstone foundation topped by a wood deck and windlass meant to mimic a nineteenth-century well. A 1903, rough-cut, granite memorial to General Stonewall Jackson is located approximately 140 feet southeast of the primary resource, just northwest of the parking area (Figure 3-43). This monument is one of roughly a dozen such markers placed by “James Power Smith in 1903 under the auspices of a committee organized by local businessmen Thomas F. Ryan and Samuel B. Woods to mark locations in Spotsylvania and Orange counties related to significant Civil War events” (Kline 2014).

Several contemporary interpretive signs are situated on a short brick wall along the northwest side of the parking lot, southeast of the primary resource (Figure 3-44). A series of signs describes the Battle of Chancellorsville and events leading up to “Stonewall” Jackson’s death here in May 1863 along with the history of Fairfield Plantation.

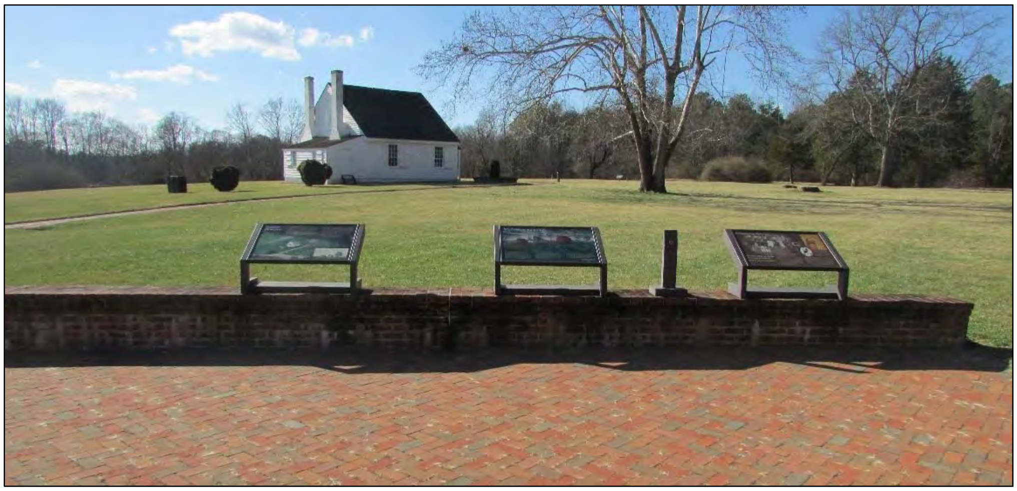

FIGURE 3-44: VIEW OF INTERPRETIVE PANELS NEAR THE PARKING AREA, LOOKING NORTH

A one-story building housing restrooms for visitors is located approximately 270 feet southeast of the primary resource and was constructed in 1985. It has a poured-concrete foundation, a frame structural system clad in weatherboard, and a front-gabled, wood-shingle roof. Two single-leaf doors on the northwest elevation leading to men's and women's restrooms are covered by a wood-shingled pent roof. The fenestration consists of six-over-six, double-hung sash, wood windows. Access to an additional room, likely housing maintenance or technical equipment, is located on the southeast elevation and is blocked from public access by chain-link fencing. Pedestrian access to the bathroom is provided by a basket weave brick walkway. A brick water fountain, likely added to the property in the mid-twentieth century, is situated at the west corner of the parking area, along the brick walkway that extends north to the office building (Figure 3-45).

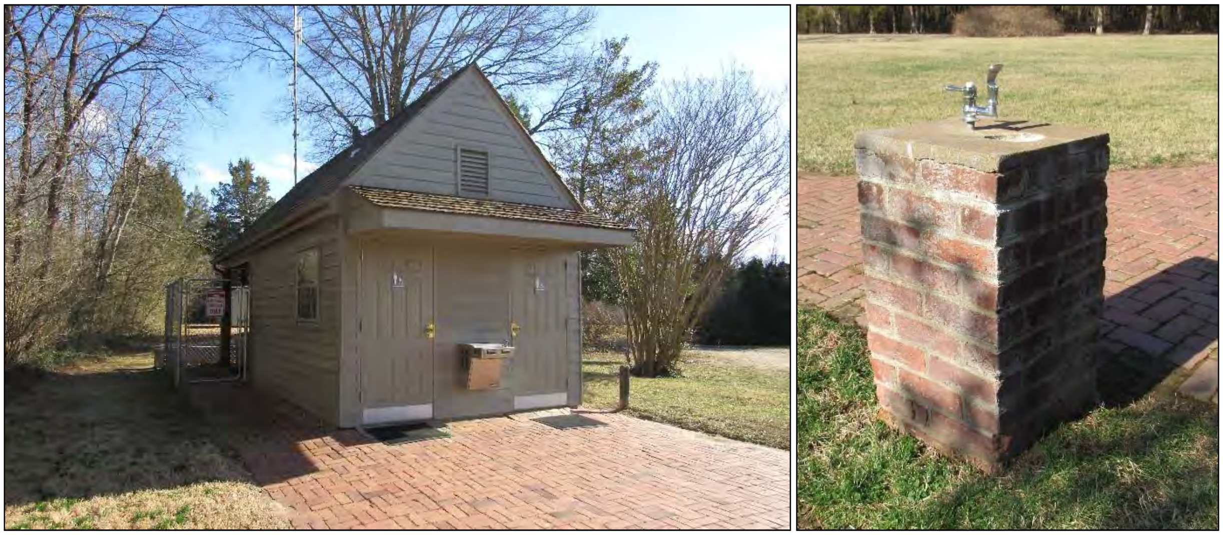

FIGURE 3-45: NORTH OBLIQUE OF RESTROOM BUILDING (AT LEFT) AND DETAIL OF FOUNTAIN, LOOKING NORTH (RIGHT)

A secondary dwelling with an address of 12023 Stonewall Jackson Road is also located within the property boundaries and was constructed in the Minimal Traditional style prior to 1949; the date is confirmed according to historic topographic maps (USGS 1942a). A small wood sign indicates that this secondary resource is a private residence, utilized by the NPS as employee housing. The one-story building has a continuous foundation of poured concrete and a frame structural system clad in a mix of vertical wood siding and horizontal aluminum siding, used in combination, especially in the gable ends (Figures 3-46 and 3-47). The primary entrance is centrally located on the northwest elevation and consists of a single-leaf door accessed via a partial-width, screened porch. A secondary entrance is located on the southeast elevation. The house is predominantly covered by an asphalt-shingled, side-gabled roof and has an interior, corbelled, brick chimney at the ridge with copper flashing. Fenestration consists primarily of six-over-six, double-hung sash, wood windows, many with aluminum-frame external screens. At least two additions have been made to the house, including a one-story, one-bay, shed-roof addition in the center of the façade. A one-story, front-gabled addition extends from the west corner of the house and stretches along its southwest elevation.

A one-story, prefabricated shed constructed in 2012 is located approximately 65 feet east of the secondary dwelling (Figure 3-48). The frame structure clad in vinyl siding has a side-gabled roof covered in asphalt shingles. A majority of the building rests on a pier-type foundation, although a small poured-concrete slab was seen at the southeast elevation where an electrical meter attaches to the resource. A double-leaf entrance is centrally located on the southwest elevation, flanked by one-over-one, double-hung, vinyl sash windows with false muntins and false shutters.

FIGURE 3-48: SHED ASSOCIATED WITH PRIVATE RESIDENCE

3.3.3 NRHP Evaluation

The Jackson Shrine (016-0092), located at 12019 Stonewall Jackson Road, is a historic commemorative complex centered on a one-and-a-half-story, frame building constructed circa 1828 that once served as the farm office for Fairfield Plantation and is the only nineteenth-century building still standing on the site. In 1936, the NPS acquired the building and established the Jackson Shrine. The Jackson Shrine is one of a number of historic sites associated with General "Stonewall" Jackson and the important role he played in the American Civil War. The most personal of these sites includes Jackson's family home in Lexington, Virginia, and his gravesite in the old Presbyterian Cemetery in the same city. Other sites include a number of battlefields where his military expertise proved critical to the war's progression, including the Chancellorsville Battlefield, now located within the Fredericksburg and Spotsylvania County Battlefields National Military Park. Within this park, there are at least three monuments to the events that led to Jackson's death: an 1879 stone marker at the site of his wounding known as "Jackson Rock," a 14-foot-tall, granite monolith erected in 1888 by Jackson's staff in his memory at Chancellorsville Battlefield and identified as the "Jackson Monument," and a 1903 marker in the Ellwood Cemetery believed to mark the burial site of Jackson's severed arm. The Jackson Shrine site, however, is the only one of these memorials with an extant building from the time of the event. Overall, this resource remains in good condition and retains sufficient historic integrity of location, design, setting, materials, workmanship, feeling, and association.

An investigation led by the NPS and conducted in 2014 to support a NRHP nomination for the Fredericksburg and Spotsylvania County Battlefields National Military Park Historic District (111-0147) found that the Jackson Shrine contributes to the district:

> …under Criterion A in the area of Military for its association with the antebellum plantation known as Fairfield, where Thomas J. "Stonewall" Jackson was taken for treatment and died after he was wounded at Chancellorsville. The site also contributes under Criterion A in the area of Conservation for its association with the creation and development of Fredericksburg and Spotsylvania National Military Park, 1927–1965, and under Criterion C in the area of Other - Commemoration for its association with the commemoration of Fredericksburg and Spotsylvania County Battlefields (Kline 2014).

Since the 2014 study, the Jackson Shrine was found during the current effort to maintain a sufficient amount of historic integrity to merit NRHP eligibility under Criteria A and C as previously recommended (Kline 2014). In the Commonwealth of Virginia, there are multiple commemorative sites related to his injuries and death, including one at the location of his fatal wound, near the Chancellorsville battlefield visitor center, another marking his burial in Lexington, Virginia, and the property of this study. As guidance for NRHP eligibility under Criterion B, properties with significant associations to important people in our past, indicates that: "Eligible properties generally are those associated with the productive life of the individual in the field in which (s)he achieved significance," the Jackson Shrine is recommended not eligible for individual listing under this Criterion (Bolland n.d.). As an architectural resource, this property was not evaluated under Criterion D.

In sum, the Jackson Shrine **is recommended eligible for listing in the NRHP under Criteria A and C.** The resource is also **recommended as contributing to the Fredericksburg and Spotsylvania County Battlefields National Military Park Historic District (111-0147).** The period of significance for the property is 1863, to include the death of Stonewall Jackson, and 1927–1968, for the period in which the office has operated as a shrine. This end date follows the NPS guidelines which say: "Fifty years ago is used as the closing date for periods of significance where activities begun historically continued to have importance and no more specific date can be defined to end the historic period" (NPS 1997).

The proposed NRHP boundary for the Jackson Shrine at 12019 Stonewall Jackson Road comprises and follows the legal lot description for 10 parcels in their entirety (Parcel IDs 16B-2-A-1, 16B-2-A-2, 16B-2-A-3, 16B-2-A-4, 16B-2-A-5, 16B-2-A-6, 16B-2-A-7, 16B-2-A-8, 16B-2-A-9, 16B-2-A-10, 16B-2-A-11, 16B-2-A-12, 16B-2-A-13, 16B-2-A-14, 16B-2-A-15, 16B-2-A-16, 16B-2-B-17, 16B-2-B-17A, 16B-2-B-18, 16B-2-B-19, 16B-2-B-19A, 16B-2-B-20, 16B-2-B-21, 16B-2-B-21A) (Figure 3-49). It is bounded on the southwest by Stonewall Jackson Road and the rail line, and on the east by Artillery Drive.

3.4 WOODFORD HISTORIC DISTRICT (016-5129)

The Woodford Historic District (016-5129) is a former railroad community in rural Caroline County, Virginia. The village is located at the intersection of Woodford Road (also known as Route 626) and the former tracks of the RF&P Railroad, constructed through the area in 1836 (Figure 3-50). The historic district is currently composed of 13 individual resources and includes a combination freight-and-passenger depot, three current and former post office buildings (one of which is still in operation), two commercial buildings, a warehouse, four outlying single-family dwellings, an outbuilding, and the pier foundation of a warehouse that is no longer extant.

3.4.1 Historic Context

When the RF&P Railroad opened its line through Caroline County in 1836, the stop at Woodford, one of only five in the county at that time, was known as Downer's Bridge (Figure 3-51) (Taylor and Sheild 2016; Wingfield 1924:34). By the mid-nineteenth century, the station and the small community surrounding it had become more commonly known as Woodford's Lane (shortened to Woodslane around 1897), named after a Revolutionary War general whose family held large tracts of land in the area (Figure 3-52) (Fall 1989:366–367; Fisher and Sparenborg 2011:196; Taylor and Sheild 2016). A post office was first established at Woodford on August 6, 1874 (Fall 1989:370). In a petition for the designation, an argument was made that a post office in that location:

> …would be a great convenience, and save much valuable time and expense as a large number are compelled to travel from six to eight miles for their mail matter, especially those living on the west side of the Mattaponi; the post office would also help build up the place, which is well located, and only lacks enterprise to make it a Town of some importance [Fall 1989:371].

On May 12, 1922, the name of the railroad station was officially changed to Woodford to correspond to the name assigned to the post office (Fall 1989:370; Taylor and Sheild 2016).

FIGURE 3-52: STOPS ALONG THE RF&P RAILROAD IN 1854 (RICHMOND DISPATCH 1854)

Despite the presence of the railroad and post office, the community seldom appears on historic maps in the late-nineteenth century (Figure 3-53) (i.e., USGS 1889). According to directories, no businesses were located in Woodford in 1877, although it contained one of the county's 15 post offices (Fall 1989:372). By 1880, the community possessed a corn-and-flour mill operated by J.L. Jordan, a sawmill operated by Stringfellow & Chewning, and one general merchant, White & Woolfolk (Fall 1989:372). By 1897, the population of Woodford was just 28, although it did contain four sawmills, an excelsior mill, two general merchants, a coach-and-wagon builder, and a constable (Fall 1989:373).

Local merchant George P. Lyon established an excelsior mill at Woodford around 1896, launching what would eventually become Caroline County's largest industry (Fall

1989:370; Fisher and Sparenborg 2011:198). For further discussion on the excelsior industry in Caroline County, see page 3-85 of this document. The influence of this business was apparent by 1910–1911, when the population had risen to 100, and the community boasted a corn-and-flour mill, two saw mills, Lyon's excelsior mill, three general stores, a grocer, a carpenter/builder, a blacksmith/wheelwright, a constable, and a commissioner of revenue (Fall 1989:373). The number of commercial and industrial concerns in the community remained about the same for the next few decades, although the residential population fluctuated. In 1940, the town had a reported population of just 60 people (Fall 1989:374). A 1942 topographic map—the first to show Woodford in any detail—reveals the community in its mid-twentieth-century configuration (Figure 3-54) (USGS 1942b). Mid-twentieth-century aerial imagery also gives some idea of the size and composition of the rural community during that period (Figure 3-55).

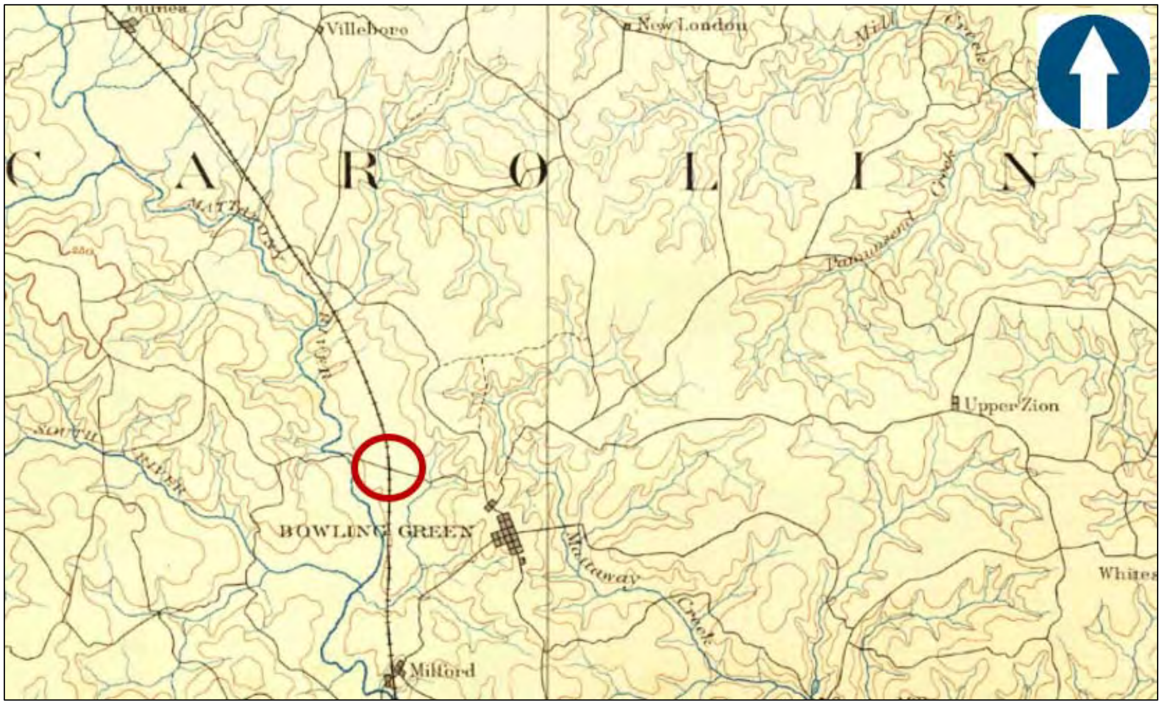

FIGURE 3-53: LOCATION OF WOODFORD (CIRCLED IN RED) ON AN 1889 TOPOGRAPHIC MAP (USGS 1889) (MAP NOT TO SCALE)

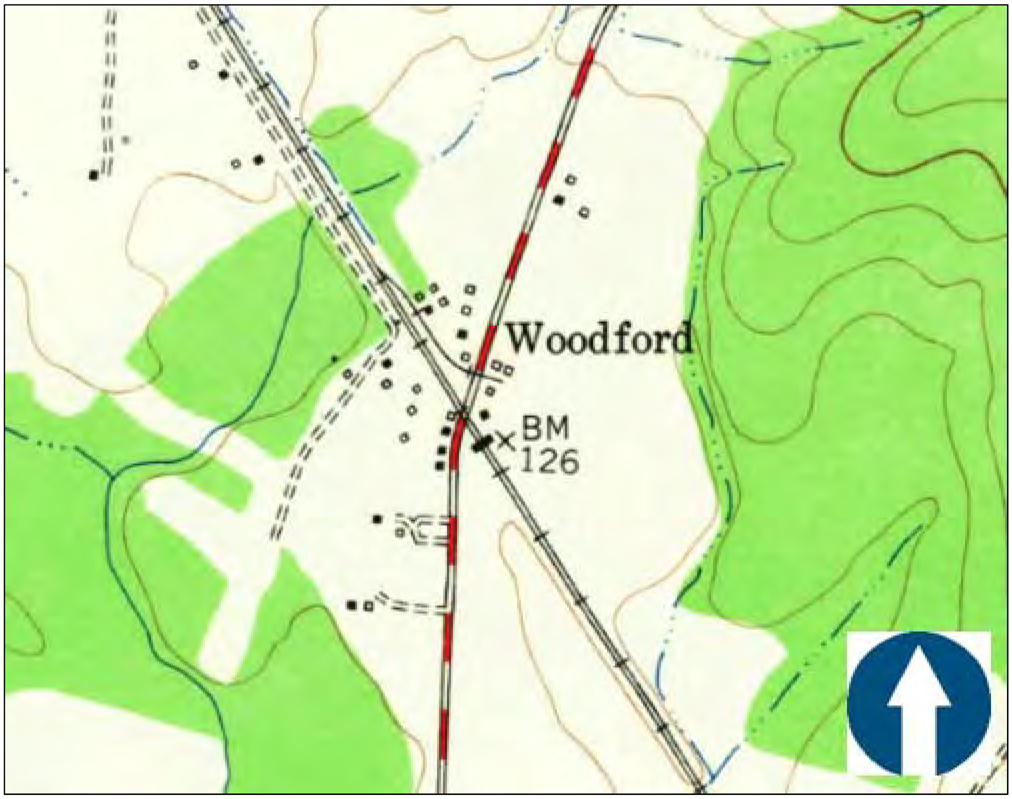

FIGURE 3-54: 1942 TOPOGRAPHIC MAP OF WOODFORD (USGS 1942B) (MAP NOT TO SCALE)

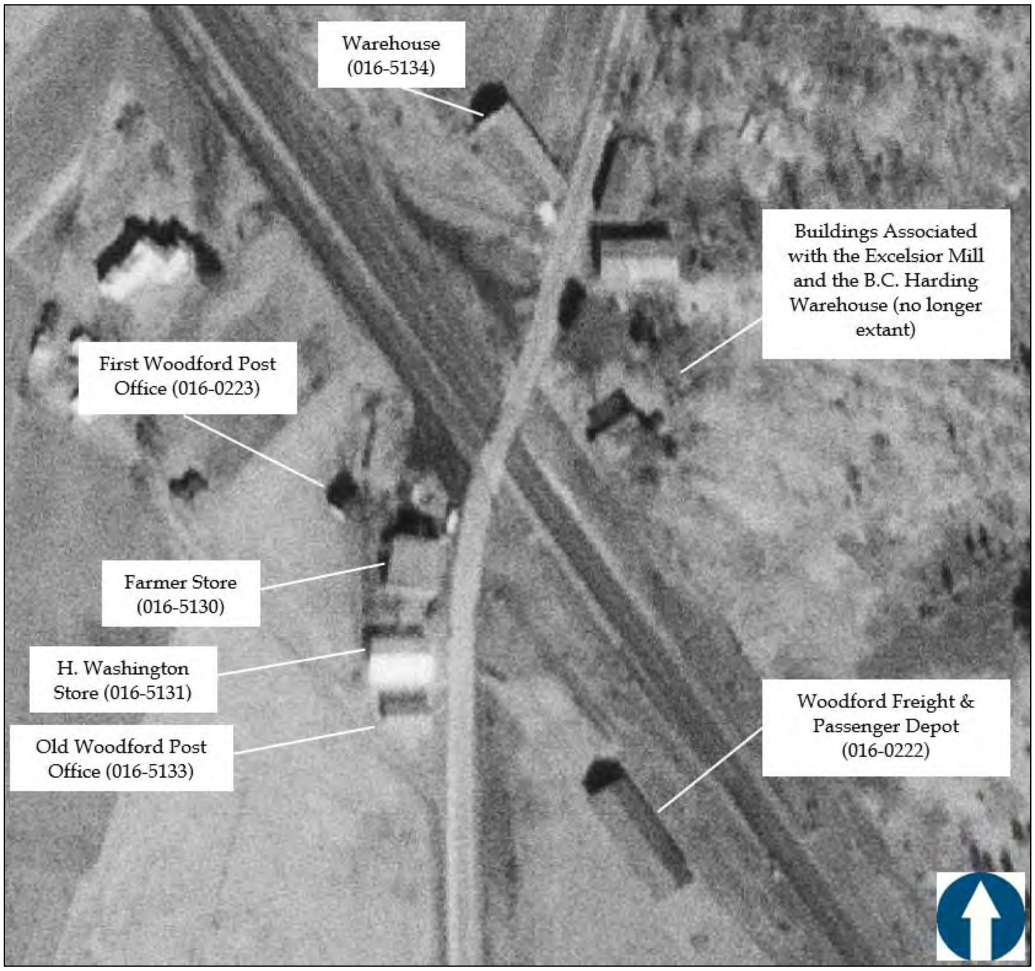
By 1924, the George P. Lyon Excelsior Co. had grown to become "the largest industrial concern in the county," providing much-needed jobs for local residents (Fall 1989:370). The excelsior mill complex, consisting of several warehouses and a loading platform, was located at the southeast corner of the railroad crossing and was accessed via a siding (Taylor and Sheild 2016). The mill caught fire several times, including in 1903 and 1905, and was eventually destroyed or demolished (Fall 1989:371; Fredericksburg Free Lance 1903, 1905a). A warehouse associated with the B.C. Harding Hay, Grain, Meal & Feed Store was also located in the southeast corner of the crossing (Figure 3-55). Today all that is left in that area is the concrete pier foundation of a warehouse once belonging to either the excelsior manufacturing complex or the feed store.



Warehouse (016-5134)

Old Woodford Post Office (016-5133)
Woodford Freight & Passenger Depot (016-0222)

FIGURE 3-55: DETAIL OF 1963 AERIAL VIEW OF WOODFORD, SHOWING THE LOCATION OF PUBLIC, COMMERCIAL, AND INDUSTRIAL BUILDINGS (UNITED STATES DEPARTMENT OF AGRICULTURE [USDA] 1963). COMPARE AGAINST FIGURE 3-50.

3.4.2 Architectural Description

The historic district is currently composed of a depot, three current and former post office buildings, two vacant commercial buildings, an abandoned warehouse, four outlying single-family dwellings, and the concrete-pier foundation of another warehouse. Although no historic photographs or maps of the village dating to the late-nineteenth and early-twentieth centuries were uncovered during research, comparisons of mid-twentieth-century aerial images and topographic maps indicate that that the roadways and some of the commercial and residential buildings are still extant, although many of the industrial resources have been demolished (Figures 3-55 through 3-57). Historically, the northeast corner of the crossing held one warehouse, which is still standing today but is in poor repair, and a farmhouse with associated outbuildings (Figure 3-55). On the northwest corner could be found a mail crane (no longer extant), a circa-1875 post office (extant but moved back from the tracks), two general stores (both in poor condition), and a 1936 concrete-block post office (now used as a private dwelling). The southwest corner of the crossing held the freight and passenger depot (extant but moved back from the tracks) and cattle pens (no longer extant). The current post office, constructed in 1969, is located nearby and still serves the community. Several single-family dwellings were also located on the outskirts of the tiny village.

Thirteen extant resources are currently located within the boundaries of the Woodford Historic District. The Woodford Freight and Passenger Depot (016-0222) still stands at the center of town and is one of only two RF&P Railroad depots remaining in the county, although it has been moved back from the tracks (Figure 3-58). A small, square, wood-framed building that served as the First Woodford Post Office (016-0223) still remains, but it, too, has been moved back (Figure 3-59). The historic district also encompasses two additional post office buildings, including a 1936 concrete-block building now used as a private residence (016-5133) and the current brick post office constructed in 1969 (016-5135) (Figures 3-59 and 3-60). Commercial buildings include the Farmer Store (016-5130) and the H. Washington Store (016-5131), both vacant and in poor condition (Figure 3-60 and 3-61). A circa-1940 shipping warehouse (016-5134) is located on the northeast side of the crossing but is also vacant and in need of repair (Figure 3-61). Four single-family dwellings are located within the district: the circa-1900, Queen Anne-style Carolina Mansion (016-0220); the circa-1925, Colonial Revival-style Glenwood House (016-0224); a farmhouse with no discernable style constructed circa 1919 (016-0225); and a Colonial Revival-style house constructed in 1953 (016-5132) (Figures 3-62 and 3-63). An outbuilding associated with the no-longer-extant Woodford House (016-0221) is located northwest of the crossing (Figure 3-63). The concrete-pier foundation of another warehouse located southeast of the crossing is considered non-contributing and has not been surveyed.

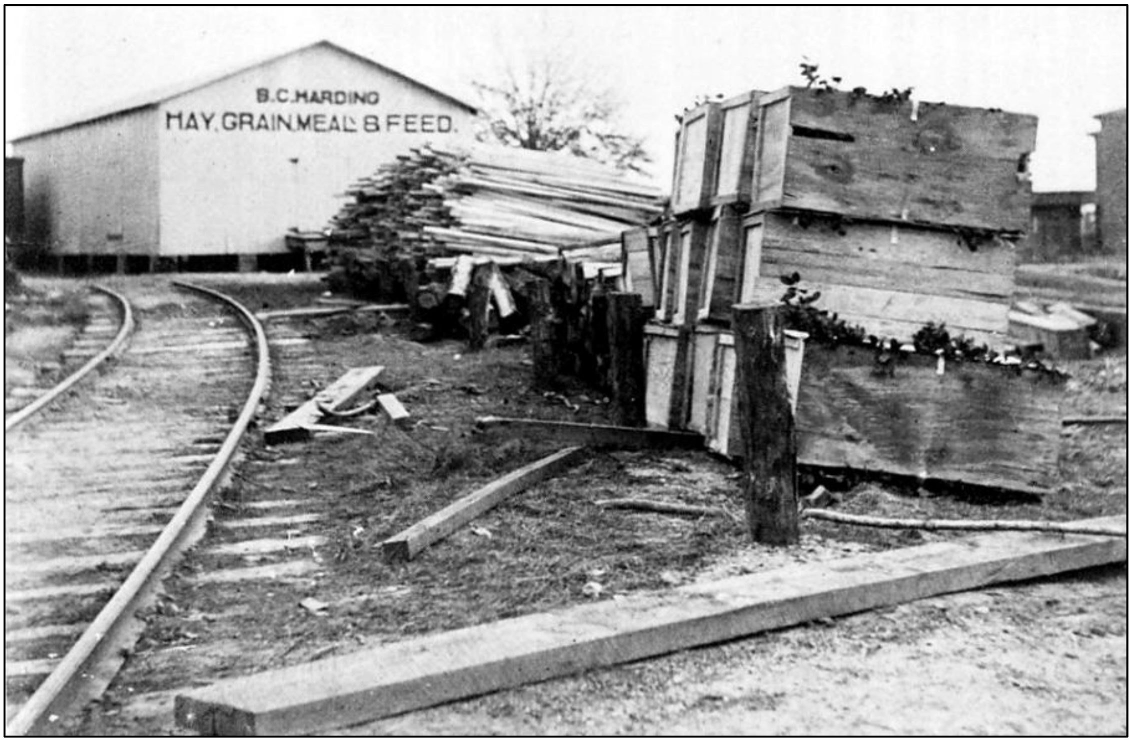

FIGURE 3-56: 1912 PHOTOGRAPH OF B.C. HARDING'S WAREHOUSE ALONG THE RF&P RAILROAD SIDING LEADING TO THE EXCELSIOR MILL COMPLEX (NO LONGER EXTANT). CRATES OF HOLLY AND STACKS OF LUMBER READY FOR SHIPMENT CAN BE SEEN IN THE FOREGROUND (GRAY 1985:65).

3.4.3 NRHP Evaluation

Woodford is an example of a small rural community created due to the construction of the railroad that brought economic growth to a rural part of Caroline County in the late-nineteenth and early-twentieth centuries. It is also the site where Caroline County's excelsior industry began around the turn of the century. Woodford has largely avoided modern development and still retains its rural character and placement along the railroad as well as a range of architectural resources that reflect its role as center of commerce in the area during this period. Although some of its buildings are vacant, the district as a whole continues to possess a relatively high level of integrity of location, setting, feeling, and association. However, Woodford is not an outstanding example of a historic rural community in Caroline County from this period with less than a dozen buildings surviving to exhibit its history. A better surviving example of this community type, located just south along the railroad, is Milford Historic District (016-5136), discussed further on page 3-104 of this report. Given the lack of extant resources associated with George P. Lyon, a prominent local businessman, or his first excelsior mill in the county, the Woodford Historic District is recommended not eligible for the NRHP under Criteria A or B.

The historic integrity of many of the contributing resources within the district has been negatively impacted by the installation of replacement materials, deferred maintenance, vacancy/disuse, and relocation, as well as the demolition of important resources such as the excelsior mill complex, the B.C. Harding warehouse, and at least one mid-nineteenth-century farm complex, resulting in a low degree of integrity of design, materials, and workmanship. For these reasons, this resource is recommended not eligible for the NRHP under Criterion C. As an architectural resource, this property was not evaluated under Criterion D.

In sum, the Woodford Historic District (016-5129) is **recommended as not eligible for the NRHP under any criteria.**

3.5 FIRST WOODFORD POST OFFICE (016-0223)

The First Woodford Post Office (016-0223), previously surveyed as the Woodford Excelsior Company Office, is located at the intersection of Lake Farm Road (an unpaved gravel drive) and Woodford Road (Route 626) in the community of Woodford (Figure 3-64). It is situated near the tracks of the former RF&P Railroad in a grassy clearing void of trees. The property on which the First Woodford Post Office is located measures approximately 0.74 of an acre and also contains the former Farmer Store (016-5130), now vacant. Current tax records describe the buildings on the property as consisting of an "old store" and a "frame shed" (Caroline County 2018). The post office is a small, square, frame building constructed circa 1875. Although some sources claimed that this building served as the Woodford Excelsior Company Office (Fisher and Sparenborg 2011:196), research conducted as part of the current project indicates that it was the community post office in the late-nineteenth and early-twentieth centuries.

3.5.1 Historic Context

A post office was first established at Woodford on August 6, 1874 (Fall 1989:370). Former Woodford residents recall that "…one of the stores held the post office depending on the political parties of the current President of the United States and the owner of the store" (Fisher and Sparenborg 2011:200). This does not, however, preclude the possibility of a separate freestanding post office building, particularly in the late-nineteenth and early-twentieth centuries when Woodford was experiencing a small measure of growth and economic success from local manufacturing endeavors. For further information about the community of Woodford, see page 3-43. In a petition for the designation, the argument was made that a post office at Woodford:

> Would be a great convenience, and save much valuable time and expense as a large number are compelled to travel from six to eight miles for their mail matter, especially those living on the west side of the Mattaponi; the post office would also help build up the place, which is well located, and only lacks enterprise to make it a Town of some importance (Fall 1989:371).

A designated post office building appears to have been constructed soon after the petition was filed (Fall 1989:371). By 1877, Woodford was one of only 15 post offices in Caroline County, a number that increased to 25 by 1884 (Fall 1989:372). By 1910, the number of post offices in Caroline County had more than doubled to 54, but by 1940 only 31 remained (Fall 1989:373–374). There are currently nine active post offices in Caroline County, including one at Woodford built in 1969 (Caroline County 2010:5-16).

The location of the post office and the buildings used by it has changed regularly in Woodford. In 1895, the post office was described as being "only 50 feet from the railroad tracks" (Fall 1989:371). In 1924, another source noted that the Woodford post office was located approximately 100 feet from the railroad station, which was later relocated itself approximately 100 feet south of its original site sometime after 1934 (Wingfield 1924:291). A December 1944 account indicates that the first post office was "moved 21 feet from its former site putting it 250 feet northeast of the railroad station" (Fall 1989:372). Although it may be closer to 300 feet distance between the current location of the Woodford Freight and Passenger Depot and the building of study, the 1944 account suggests a second move for the extant first post office building.

According to the recollections of a local resident, the northwest corner of the crossing where the Woodford Post Office is located was at one time occupied by a "mail pick-up stand" (better known as a mail crane), which is no longer extant (Taylor and Sheild 2016). Mail cranes were common in rural areas and allowed the mail to be picked up by the train without stopping or even slowing down by attaching the mail bag to a crane shortly before the train was due; incoming mail was simply thrown off the train (Caroline County 2010:5-16; Mallery 2016; Smithsonian Institution 2016) (Figure 3-65).

In addition to its location near other commercial buildings in the community, deed research further suggests that the building of study was a post office rather than George Lyon's excelsior mill company office (Figure 3-66). In 1893, Samuel B. Jeter was appointed Postmaster at Woodford (United States Post Office Department 1893). The following year, he purchased the lot at the northwest intersection of the railroad and the county road from A.B. Chandler (Caroline County Deed Book [CCDB] 64:542). It may be that Jeter purchased this property in part because it contained the First Woodford Post Office, and he was serving as the Postmaster at that time. In 1895, the parcel was transferred to T.B. and W.R. Jeter, operating under the name of Jeter &

Brother, who owned the parcel until 1899 (CCDB 65:63, 67:408). The parcel changed hands a couple more times until 1926, when it was sold to Benjamin A. Dratt (CCDB 96:408). Coincidentally, Dratt had been appointed Postmaster at Woodford in 1913 and continued to serve in that position until his death in 1936 (United States Post Office Department 1893). After his death, his wife, Lillie M. Dratt, served as Postmaster for several months until a replacement could be appointed. Lillie Dratt owned the parcel containing the building of this study until 1947. Therefore, she would likely have been responsible for moving it back from the railroad tracks in 1944 (Caroline County Will Book 39:161; CCDB 167:137, 390:836). In 1947, Dratt conveyed the parcel to John W. Burke, Sr., and it remains under the ownership of the Burke family to this day.

FIGURE 3-66: CURRENT AND FORMER LOCATIONS OF RAILROAD DEPOT IN WOODFORD, VIRGINIA (GOOGLE EARTH 2018) (NOT TO SCALE)

3.5.2 Architectural Description

3.5.2.1 Primary Resource Exterior

The First Woodford Post Office (016-0223) is a small rectangular building constructed circa 1875 located at the southeast corner of the intersection of Lake Farm Road and Woodford Road, also known as Route 626 (Figures 3-67 and 3-68). This one-story, one-bay building features elements of the Queen Anne and Folk Victorian styles (Figures 3-69 through 3-71). It rests on a poured-concrete pier foundation that likely dates from the circa-1947 relocation of the building. The frame structural system is clad in weatherboard with plain cornerboards. The front-gabled roof is covered by standing-seam metal and features exposed rafter tails at the side elevations. A small, internal, brick chimney pierces the roof's ridge near the southwest end of the building and was likely used to vent a wood stove. A full cornice return lines the façade, or northeast elevation, where the gable end is clad in scalloped weatherboard and features a central decorative sawn vent.

The main entrance is located on the northeast-facing façade and consists of a single-leaf, five-panel, wood door. A single window dots every elevation and is filled by a two-over-two, double-hung-sash, wood-framed window (vertical muntins) and covered by double-leaf, operable, louvered, wood shutters on all but the southwest elevation where the shutters have been removed, although some hardware remains extant.

3.5.2.2 Primary Resources Interior

Interior access was not granted during the current survey.

3.5.3 NRHP Evaluation

The village of Woodford was one of five original stops along the RF&P Railroad in Caroline County, the others being located at Ruther Glen, Penola or "Pole Cat," Milford, and Guinea, although there were several flag stops in between (Griffin 1984:85). The First Woodford Post Office is believed to date circa 1875 and served as the community until 1936 when a new building was constructed. Although it has not functioned as a post office for more than 80 years, the circa-1875 building is in fair condition. The exterior paint is failing and a subtle swayback is visible in the center of the northwest wall, but the post office retains a high level of historic integrity in design, materials, workmanship, and feeling from the exterior, and it is one of the few extant architectural resources in Woodford from the late-nineteenth century. Its historic integrity of location has been affected by relocation, but this resource continues to be situated within the Woodford community and near the railroad corridor. As such, it is believed to have a high level of historic integrity of setting. No visible associations of the building indicate its historic use at the exterior, including the absence of a mail crane; therefore, the building has low historic integrity of association as a rural post office.

The First Woodford Post Office has no known association with any significant event or person and therefore is recommended not eligible for the NRHP under Criteria A or B. The building is believed to be one of few surviving rural post offices in Caroline County and the sole surviving non-residential resource from the late-nineteenth century constructed in the Queen Anne style in Woodford. In addition to the First Woodford Post Office, two other current or former post office buildings are located in Woodford (Figure 3-66). Previously surveyed as the Old Woodford Post Office (016-5133), a small concrete-block building constructed in 1936 addressed at 11064 Woodford Road is located approximately 200 feet southwest of the railroad crossing and currently functions as a private dwelling. The current Woodford Post Office (016-5135), located at 11087 Woodford Road, is a one-story building clad in a brick veneer constructed in 1969. According to V-CRIS records, seven current or former post office buildings have been identified in Caroline County, not including the First Woodford Post Office. In addition to the two other post offices at Woodford, post offices have been identified in the communities of Edgar (1900), Lorne (1892), Milford (1960), and Bowling Green (1850 and 1980). Only two of these date to the nineteenth century, neither of which has been evaluated for the NRHP. One of these, the building recorded in Edgar, appears to have been demolished (Google Earth 2017). The post office in Woodford is one of the few examples situated in proximity to the railroad. Although the interior was not accessed, this resource retains a higher level of historic integrity than most other extant commercial, civic, and rail-related resources in the community. Therefore, it is recommended eligible for the NRHP under Criterion C as a unique example of an extant rural post office in Caroline County.

According to National Register Bulletin *How to Apply the National Register Criteria for Evaluation*, "A property removed from its original or historically significant location can be eligible if it is significant primarily for architectural value or it is the surviving property most importantly associated with a historic person or event" (Shrimpton et al. 1990:29). Additionally, "A moved property significant under Criterion C must retain enough historic features to convey its architectural values and retain integrity of design, materials, workmanship, feeling, and association" (Shrimpton et al. 1990:29). Because the First Woodford Post Office retains a high degree of integrity of design, setting, materials, workmanship, feeling, and association as well as "an orientation, setting, and general environment that are comparable to those of the historic location and that are compatible with the property's significance," the resource meets Criteria Consideration B for Moved Properties (Shrimpton et al. 1990:30). As an architectural resource, this property was not evaluated under Criterion D.

In addition, the First Woodford Post Office is located within the boundaries of the newly surveyed Woodford Historic District (016-5129). However, the Woodford Historic District is being recommended as not eligible for listing in the NRHP.

In sum, the First Woodford Post Office is **recommended individually eligible for listing in the NRHP under Criterion C at the local level for its architectural significance, and it also meets Criteria Consideration B**.

The proposed period of significance for this resource dates from 1874 to 1875, the year in which it is believed to have been constructed. The NRHP boundary for this resource is limited to a rectangular area around the building's footprint (Figure 3-72).

3.6 WOODFORD FREIGHT & PASSENGER DEPOT (016-0222)

The Woodford Freight and Passenger Depot (016-0222) is located on Woodford Road (Route 626) adjacent to the tracks of the former RF&P Railroad in the small community of Woodford and within the boundaries of the Woodford Historic District (016-5129) (Figure 3-73). The resource served as both a freight and passenger station. It was one of five original stations built in Caroline County along the RF&P Railroad and one of the only combined function depots in the county (Griffin 1984:85).

3.6.1 Historic Context

Although Woodford had been a stop on the RF&P Railroad for over half a century, it is unknown what type of depot, if any, existed in that location prior to 1900. For further information about the community of Woodford, see page 3-41. In that year, Willie and Sam Jeter conveyed a small portion of their 50.3-acre parcel at Woodford to the RF&P Railroad Company as a "collateral conveyance" (CCDB 953:533).

The land measured 0.3 acres (roughly 100 feet by 80 feet) and was described as being located "at the station known as 'Woodslane' and lying on the southwest side of the Railroad land and the southeast side of the public road at that point" (CCDB 68:196). A map attached to the deed shows that the lot was intended for a depot, suggesting that the current depot building was constructed circa 1900 or shortly thereafter, possibly replacing an earlier structure (Figure 3-74).

It is unclear how long the RF&P Railroad owned and operated the Woodford Freight and Passenger Depot. In 1934, the company filed a petition to abandon four agent stations in Caroline County, including Woodford, Ruther Glen, Penola, and Guinea, suggesting that the station may have fallen into disuse around that time (The Bee 1934). Although the land was still owned by the railroad, historic aerial imagery indicates that by 1963 the depot had been moved to its current location on private property, approximately 100 feet south of its original position, which is confirmed by other sources (Fisher and Sparenborg 2011:199; Taylor and Sheild 2016). This is also visible in a 1969 plat that clearly shows the depot parcel, identified as "R.F.&P. Depot Lot" (Figure 3-75) (CCDB 172:426). The larger parcel on which the depot is now located, a part of the original 50.3 acres owned by Willie and Sam Jeter, was conveyed to subsequent generations of the Jeter family and is currently under the ownership of Jeter Properties LLC (CCDB 127:466, 953:533; Caroline County Will Book [CCWB] 43:165, 46:593).

FIGURE 3-75: PLAT MAP OF WOODFORD FREIGHT AND PASSENGER DEPOT LOT IN 1969 (CCDB 172:426)

The combination freight-passenger station, also called a combination depot, was a relatively common station form in small towns during the late-nineteenth and early-twentieth centuries (Griffin 1984:57). Combination depots were generally rectangular in shape and contained a freight room, passenger waiting room, and a depot agent's office (Storey 2016). On the freight end of the building, large sliding doors could be found on both sides for loading and unloading. Sometimes a depot agent's office bay window projected from the track-side elevation to provide better visibility up and down the tracks and may also have served to visually separate the freight and passenger sections of the depot (Storey 2016). This projecting bay element can be clearly seen at the Woodford depot as well as on other combination depots in rural Virginia (Figures 3-76 through 3-78).

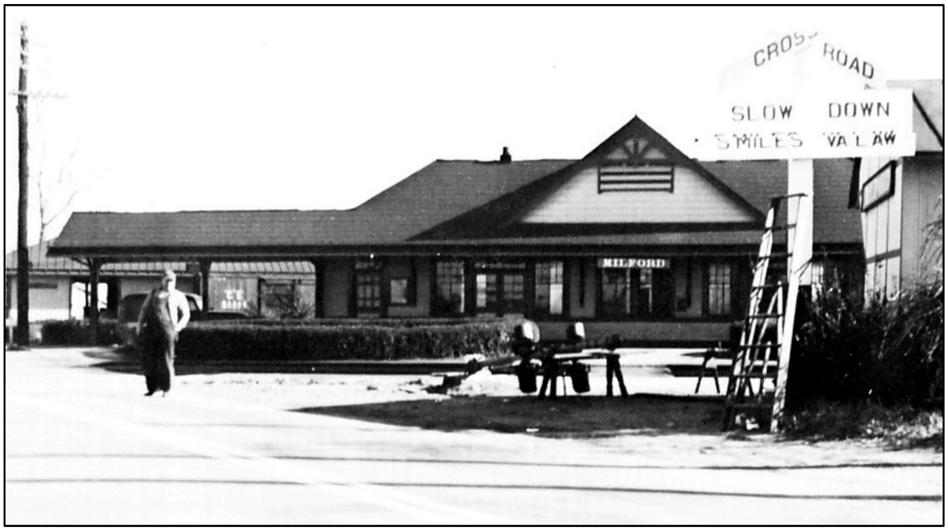

FIGURE 3-76: SEPARATE PASSENGER DEPOT (FRONT) AND FREIGHT DEPOT (REAR) AT MILFORD, CIRCA 1940 (GRAY 1985:98)

3.6.2 Architectural Description

3.6.2.1 Primary Resource Exterior

The Woodford Freight and Passenger Depot is a long, rectangular, one-story building measuring approximately 100 feet in length and 35 feet wide (Figures 3-79 and 3-80). The frame building was constructed circa 1900 and rests on a foundation of concrete-block piers that appear to be replacements. It is clad in wood board-and-batten siding. The side-gabled roof is covered with standing-seam-metal roofing with wide overhanging eaves supported by simple decorative brackets, protecting the platform along the east elevation (Figures 3-80 and 3-81). Metal ice dams project from the roof surface above each of the freight doors (two on the northeast elevation and two on the southwest elevation) to divert runoff, protecting freight as it was being loaded and unloaded. Two round metal-stove vents pierce the roof near the northwest end of the building.

1104

FIGURE 3-78: COMBINATION FREIGHT/PASSENGER STATION AT BASSETT, VIRGINIA (LEFT); COMBINATION FREIGHT/PASSENGER STATION AT WINFALL, VIRGINIA (NORFOLK SOUTHERN 2016) (RIGHT)

In the southeast half of the façade, two large sliding doors constructed of diagonal wood boards arranged into four panels provide access to the freight portion of the building (Figure 3-81). Two identical freight doors are located on the southwest elevation and are accessed via a smaller, raised, wood platform (Figure 3-81). The window openings on this elevation have been boarded over; however, the rest of the windows on the building contain six-over-six, double-hung, wood sashes with slightly peaked lintels. On the façade, two single-leaf, paneled, wood doors with transoms lead out to the covered freight/passenger platform with a wood deck that spans the entire width of the northeast façade parallel to the railroad tracks (Figure 3-82). The northwest end of the façade, which provided access to the passenger section of the station, features a polygonal bay window that likely contained the ticket office (Figure 3-82).

3.6.1.2 Primary Resource Interior

Interior access was not obtained during the current survey.

3.6.3 NRHP Evaluation

The Woodford Freight and Passenger Depot was constructed circa 1900 to service both freight and passenger traffic for the village. Today, the building is one of only two surviving RF&P Railroad depots in Caroline County, the other being the Milford Freight Depot (016-0266), and is the only surviving combination freight-passenger depot in the county. The building retains a high level of historic integrity of design, setting, materials, workmanship, feeling, and association, although integrity of location has been affected by the relocation of the building several meters southeast of its original location. Despite being moved from its original location, the resource maintains proximity to, and a visual connection with, the railroad tracks.

The Woodford Freight and Passenger Depot has no known association with any significant event or person from history; and therefore, is recommended not eligible for the NRHP under Criteria A or B. The combination freight-passenger station, also called a combination depot, was a relatively common station form in small towns during the late-nineteenth and early-twentieth centuries (Griffin 1984:57). The relocation of the Woodford depot may have actually preserved the resource. Depots that were no longer needed by the railroad were frequently demolished, possibly to minimize taxes and liability (Trainorders.com 2005). If they were not demolished, they were often moved away from the tracks so that they would not interfere with track improvements and expansion. The good condition of the Woodford Freight and Passenger Depot is likely due in part to its relocation to an adjacent private property, which preserved it from demolition by the railroad company. Its preservation was perhaps also influenced by the relatively undeveloped setting and rural character of the largely abandoned community of Woodford, which has never reached official town status and has seen almost no growth since the early twentieth century. As the last surviving combination depot in Caroline County, the Woodford Freight and Passenger Depot is recommended eligible for the NRHP under Criterion C.

According to National Register Bulletin *How to Apply the National Register Criteria for Evaluation*, “a property removed from its original or historically significant location can be eligible if it is significant primarily for architectural value or it is the surviving property most importantly associated with a historic person or event” (Shrimpton et al. 1990). Additionally, “a moved property significant under Criterion C must retain enough historic features to convey its architectural values and retain integrity of design, materials, workmanship, feeling, and association” (Shrimpton et al. 1990:29). Because the Woodford Freight and Passenger Depot retains a high degree of integrity of design, setting, materials, workmanship, feeling, and association as well as “an orientation, setting, and general environment that are comparable to those of the historic location and that are compatible with the property’s significance,” the resource meets Criteria Consideration B for Moved Properties (Shrimpton et al. 1990). As an architectural resource, this property was not evaluated under Criterion D.

In addition, the Woodford Freight and Passenger Depot is located within the boundaries of the newly surveyed Woodford Historic District (016-5129). However, the Woodford Historic District is being recommended as not eligible for listing in the NRHP.

In sum, the Woodford Freight and Passenger Depot is **recommended eligible for the NRHP under Criterion C and Criteria Consideration B.**

The period of significance for the Woodford Freight and Passenger Depot begins with its construction circa 1900 until its disuse around 1934. The proposed NRHP boundary for the Woodford Freight and Passenger Depot should be restricted to include the triangular section of land on which the depot is situated at the north end of the parcel 29-A-20, ending at the current post office (Figure 3-83). The large swath of private property south of the post office bears no connection to the depot and is therefore excluded from the eligible boundaries. The proposed boundary includes the train depot and immediate landscape.

3.7 GLENWOOD HOUSE (016-0224)

Glenwood House is located on the west side of Woodford Road (Route 626), approximately 0.1 miles south of the railroad crossing with Woodford Road in Caroline County, Virginia (Figure 3-84). The property is composed of 10.81 acres situated in an area of the county that is sparsely populated and primarily rural, known as the village of Woodford. The property is bounded by Woodford Road on the east, a residential and agricultural property and Lake Farm Road on the north, an agricultural property to the west, and the Carolina Mansion (016-0220) property to the south. Buildings are concentrated in the center of the parcel and are immediately surrounded by deciduous trees and shrubbery. An unpaved driveway extends from Woodford Road towards the dwelling and circles back towards the road. A portion of the driveway extends to the garage situated northwest of the dwelling.

3.7.1 Historic Context

The Glenwood House is located on a parcel that was subdivided from a larger 100-acre lot purchased by Porter Lyon in 1869 from John Washington (CCDB 53:476–477). In 1886, Porter Lyon conveyed 50 acres of the 100-acre tract to his son, George P. Lyon, "in consideration of natural love and affection" with the intention that George Lyon would care for this portion of the property whilst allowing his father and mother to continue to reside there (CCDB 61:344; U.S. Census 1910). This portion was concentrated on the west side of Woodford Road, south of the RF&P Railroad track and north of the Mattaponi River. It is sometime after 1886 that George Lyon built the Carolina Mansion as his own residence.

George Lyon was a local merchant and eventual founder and operator of the Woodford Excelsior Mill that opened in 1896 (U.S. Census 1900; Wingfield 1924:26). His excelsior mill operation remained a fairly successful company by using local pine, which was in abundance, to produce utilitarian products (Figure 3-85) (Wingfield 1924:25). George Lyon was not only a successful manufacturer, but he also was extremely involved in the community, serving as supervisor of the Port Royal District, being elected to the Virginia House of Delegates in 1923, and becoming the first president of the Virginia Excelsior Manufacturers' Association (The Bee 1933:1; Wingfield 1924:25). George Lyon and his wife, Ada M. Fell Lyon, conveyed a 35-acre portion of the 50-acre tract to their daughter, Minnie M. Harding, in 1922 that included the Carolina Mansion (CCDB 91:142). Shortly thereafter, George Lyon built another dwelling, the Glenwood House, around 1928 in the American Foursquare form. In 1933, when George Lyon passed, he willed the remainder of the property to his wife who, upon her death in 1953, bequeathed it to their daughter, Minnie Harding (CCWB 39:104; Central Rappahannock Heritage Center [CRHC] 1953).

766,050. EXCELSIOR-MACHINE. GEORGE F. LYON, Woodford, Va. Filed Feb. 6, 1904. Serial No. 192,362. (No model.)

Claim.—1. In an excelsior-machine, the combination with the

FIGURE 3-85: GEORGE LYON'S 1904 PATENT FOR HIS EXCELSIOR-MACHINE (UNITED STATES PATENT OFFICE 1904:974)

Minnie Harding and her husband, Bennett Clark Harding, lived in Woodford until the 1940s when they moved to Florida (United States City Directories [U.S. City Directories] 1942). It is unclear if the Hardings remained in Carolina Mansion or moved into Glenwood House after her father's passing; however, George and Ada Lyon are noted to be neighbors of the Hardings in the 1930 federal census (U.S. Census 1930). After her death in 1966, Minnie Harding bequeathed the Glenwood House property along with the adjacent Carolina Mansion property to her first cousins: Myrtle Durrett, Inez Fell Matthews, Mamie Fell Blanton, and Pearl Fell (CCWB 45:152–157). Myrtle Durrett passed away in 1980. At her death, she desired her estate, including her share in the Woodford properties, be sold and the money dispersed among her sisters and co-property owners (CCWB 46:211–515). After a Chancery Court case, the property was sold at the end of 1980 to Jerry S. and Peggy J. Brown, who continue to reside there today (CCDB 258:174).

3.7.2 Architectural Description

3.7.2.1 Primary Resource Exterior

The building known as the Glenwood House is a two-and-one-half-story, five-bay, single-family dwelling constructed circa 1928 in the American Foursquare form with Colonial Revival and Craftsman-style details composed of a central two-and-one-half-story core with flanking one-story wings (Figures 3-86 through 3-88). The continuous raised foundation supports a structural system that is clad in multi-tone brick, laid in a Flemish bond embelished with brick quoins, a typical Colonial Revival detail. The building is covered by a moderately pitched, hipped roof sheathed in standing-seam metal with wide eaves featuring wood modillions. Two hipped dormers with wide eaves pierce the roof on the west and east elevation and contain louvered vents. The roof also features two brick chimneys with stepped metal flashing, one being an interior-end chimney with a concrete cap in the west half of the south elevation and the other being an exterior-end chimney with a concrete cap in the east half of the north elevation.

FIGURE 3-87: DETAILED SITE PLAN OF THE GLENWOOD HOUSE (GOOGLE EARTH 2017) (NOT TO SCALE)

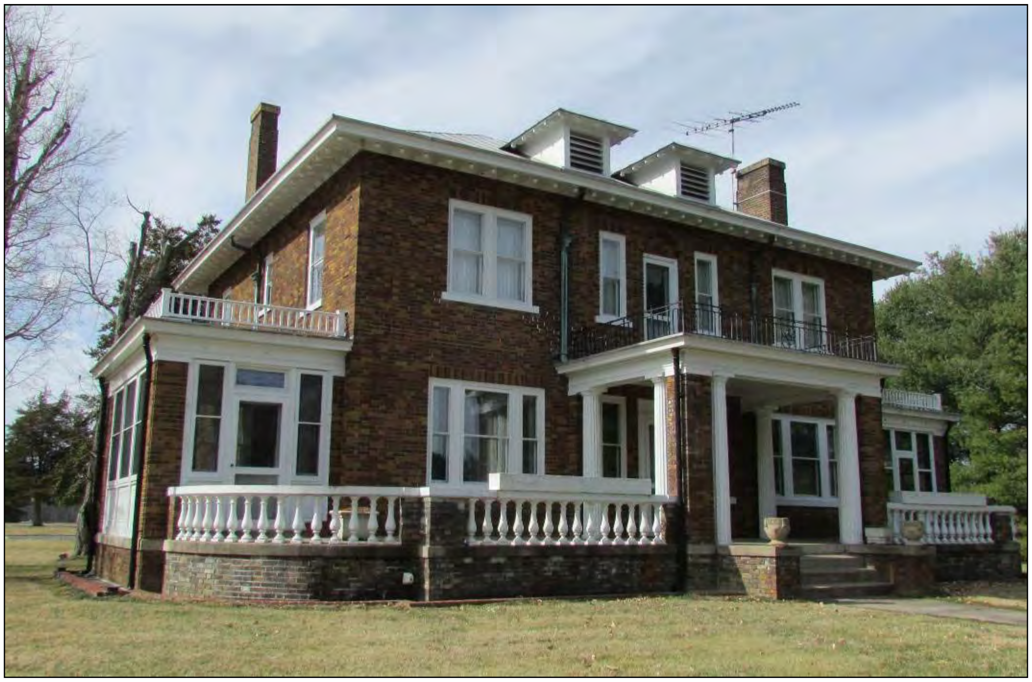

FIGURE 3-88: SOUTHEAST OBLIQUE

The primary entrance, centered on the east elevation, is filled with a single-leaf, wood, five-paneled door with a wood-and-screen storm door. The entrance is elaborated by a wood surround with squared pilasters. Flanking the door are single, one-over-one, double-hung, wood-frame, windows on concrete sills with wood-framed screens (Figure 3-89). Centered in front of the primary entrance is a one-story, one-bay brick porch with a concrete deck covered by a flat roof with a iron balustrade. The roof is supported by squared brick posts with fluted, Doric columns, and the porch is accessed by a set of concrete steps flanked by brick retaining walls. The porch contiues on the north and south sides as a raised, uncovered, curved veranda lined with a molded concrete balustrade which extends to both of the flanking one-story wings. Other fenestration consists of one-over-one, wood-frame, double-hung-sash windows situtuated in a single, paired, or ribbon pattern that also feature wood surrounds and concrete sills. In the raised basement are three-light, wood-frame awning windows.

The screened porch wings, each located in the eastern half of the north and south elevations, are virtually identical, each covered by a low-pitched hipped roof lined with a low squared balustrade supported by squared brick posts with wood-frame screens and wood paneling along the base. The north wing also features a secondary entrance. Another screened porch similar to the north and south wings is off-centered on the west elevation and provides an additional entrance to the dwelling (Figure 3-89). This porch is supported by a continuous brick foundation and has wood-framed screened windows on the north, west, and south elevations. A patinated copper drain pipe is centrally located on the west elevation.

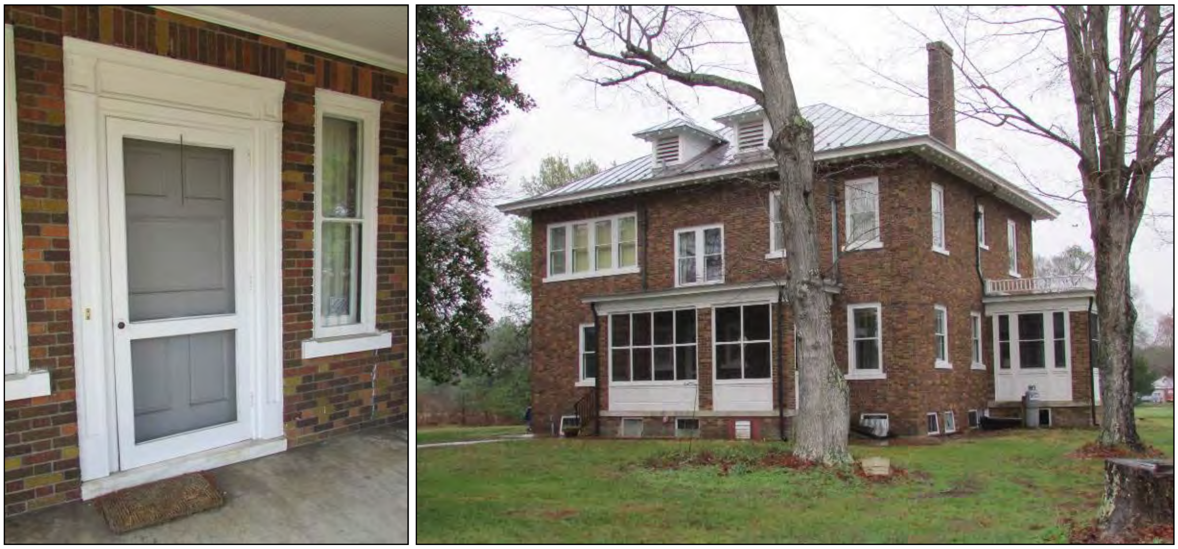

FIGURE 3-89: PRIMARY ENTRANCE, EAST ELEVATION (LEFT); SOUTHWEST OBLIQUE (RIGHT)

3.7.2.2 Primary Resource Interior

Interior access was not granted during the current survey.

3.7.2.3 Secondary Resources

Situated northwest of the primary resource is a circa-1930, one-and-one-half-story, three-bay garage (Figure 3-90). The exterior is clad in brick laid in a varity of bond patterns: Flemish bond in the center of the east elevation and a basketweave pattern on the remainder of the building. It is covered by a steeply pitched clipped gabled roof sheathed in standing-seam metal with flared eaves and scrolled modillions. Two hipped dormers are situated on the east elevation and an interior-end brick chimney on the west elevation. The large garage bays are filled with wood, sectional garage doors made to resemble double-leaf, board-and-batten doors. In between the garage doors is a single-leaf door with a three-light, wood-frame transom set above. Extending from the west elevation is a one-story, frame, flat-roof addition primarily clad in snap-on batten-with-clip metal siding (Figure 3-90). The west elevation of this addition has a metal-frame, screened, multi-bay porch. A circa-1928 metal well pump is situated west of the dwelling, on the south side of a concrete walkway leading from the dwelling to the garage (Figure 3-91). A set of four circa-1990 wells are located southwest of the primary resource. They are all covered by circular metal caps (Figure 3-91).

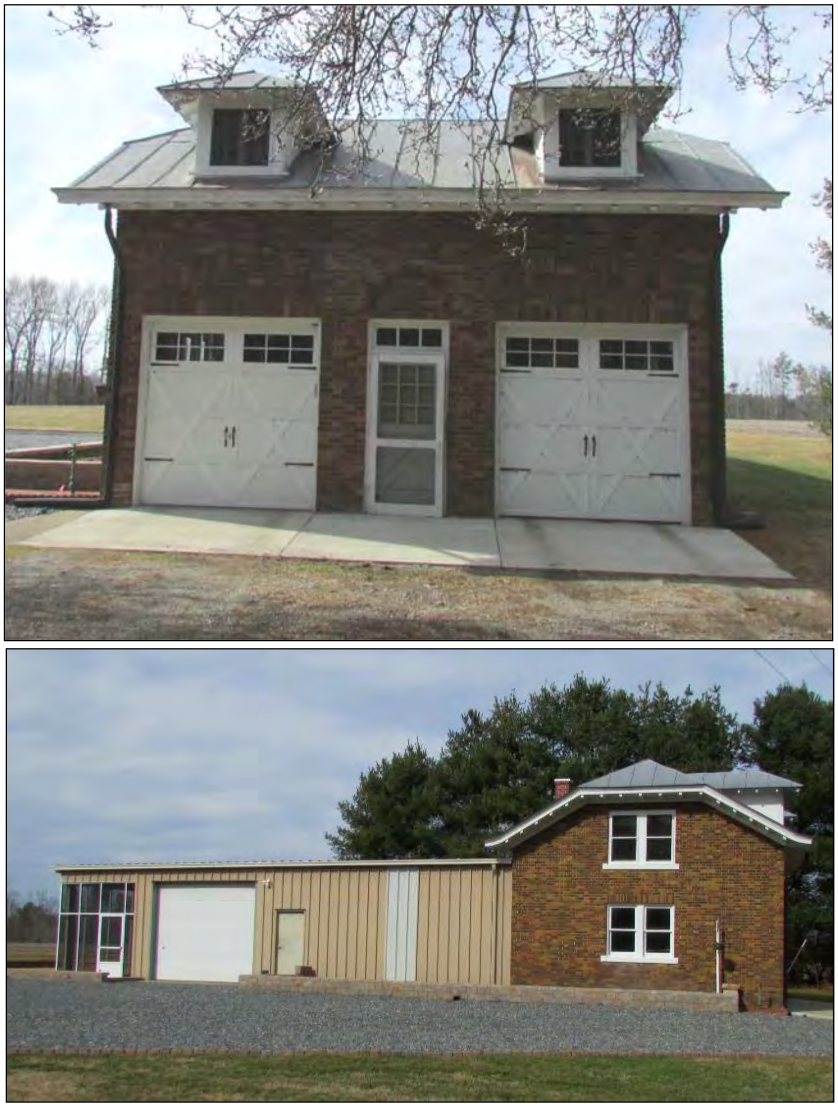

FIGURE 3-90: GARAGE, EAST ELEVATION (TOP); SOUTH ELEVATION (BOTTOM)

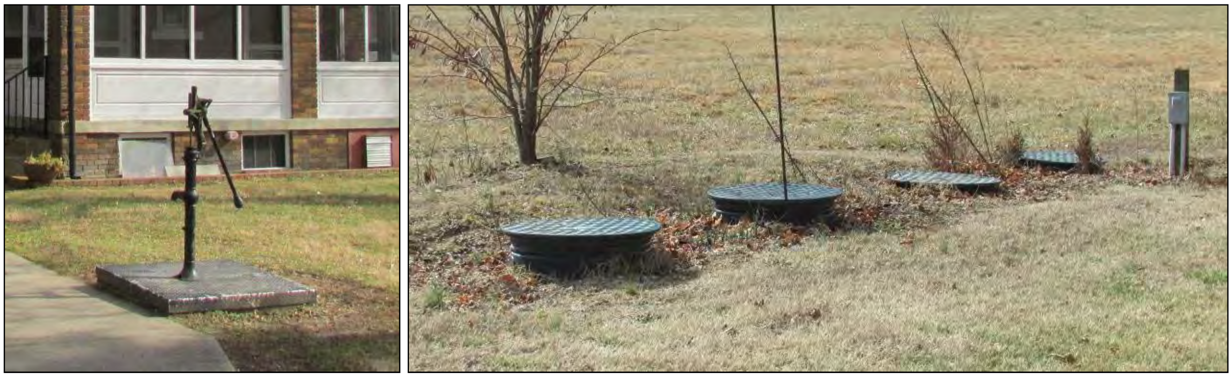

FIGURE 3-91: WELL PUMP, LOOKING EAST (LEFT); FOUR WELLS, LOOKING SOUTHWEST (RIGHT)

3.7.3 NRHP Evaluation

The Glenwood House (016-0224) was constructed around 1928 after George P. Lyon transferred his first dwelling in Woodford, the Carolina Mansion (016-0220), to his daughter. The dwelling, though having experienced some common, modest modifications such as the addition of a rear porch, continues to retain a high level of significance of location, setting, materials, workmanship, feeling, association and design evoking the building's architectural style and period of construction.

In order for a resource to be considered eligible for the NRHP under Criterion A, "a property can be associated with either (or both) of two types of events: […] a specific event marking an important moment in American prehistory or history [or] a pattern of events or a historic trend that made a significant contribution to the development of a community, a State, or the nation" (Shrimpton et al. 1990). The Glenwood House has no known association with a notable historic event or trend**.** As such, it is recommended not eligible for listing in the NRHP under Criterion A.

Eligibility of a resource for the NRHP under Criterion B is defined as needing to be associated with a person who is "individually significant within a historic context" and has "gained importance within his or her profession or group" (Shrimpton et al. 1990). Although the dwelling was constructed by George P. Lyon, a local entrepreneur in the excelsior industry and political figure, he is not the only such figure in the county or in surroundings counties. As many successful businessmen attributed to the excelsior industry in Caroline County (further discussed on page 3-86 of this report), George P. Lyon, whose excelsior operation is no longer in operation and is in disrepair, did not play a distinctively important role nor were his contributions to the community of Woodford unique in the comparison to these other businessmen to qualify this property for significance under Criterion B (Bolland n.d.). For these reasons, the Glenwood House is recommended not eligible under Criterion B.

The Glenwood House, constructed around 1928, is an outstanding example of an American Foursquare with modest Craftsman and Colonial Revival-style elements. Such stylized dwellings are not common in this part of Caroline County and reflected the social and financial status which George Lyon achieved. It is not known if an architect was employed in its design; however, the excellent condition of historic buildings on the property render the resource eligible under

Criterion C at the local level for architecture. As an architectural resource, it was not evaluated under Criterion D.

In sum, the Glenwood House is **recommended as eligible for listing in the NRHP at the local level under Criterion C.** In addition, the Glenwood House is located within the boundaries of the newly surveyed Woodford Historic District (016-5129). However, this district has been recommended not eligible as a result of the current study.

The proposed period of significance for the Glenwood House consists of the period in which it was constructed, between 1928 and 1929. The proposed NRHP boundary for the Glenwood House comprises and follows the legal lot description for the parcel in its entirety (tax map number 29-A-12) (Figure 3-92). It is bounded by Woodford Road on the east, a residential and agricultural property and Lake Farm Road on the north, agricultural property to the west, and the Carolina Mansion (016-0220) property to the south. The proposed boundaries include the Glenwood House, garage/carriage house, and unpaved driveway.

3.8 EXCELSIOR INDUSTRY OF CAROLINE COUNTY HISTORIC DISTRICT (016-5165)

The Excelsior Industry of Caroline County Historic District (016-5165) includes a discontiguous group of properties along the RF&P Railroad constructed between 1896 and 1960 associated with the manufacture of excelsior—Caroline County's largest industry in the early-twentieth century. Excelsior, known as "wood wool" outside of North America for its fine texture, comprises uniform shavings or coils of wood that was used for a variety of purposes, including padding/stuffing for furniture and mattresses and as packing material for glassware and other fragile items (Charles A. Strelinger & Company 1897:966; Davis 1983:160).

The proposed historic district includes four architectural properties associated with the excelsior industry in central Caroline County: the DeJarnette Lumber Company (016-5137) in the village of Milford, two excelsior mills in the community of Ruther Glen (016-5105 and 016-5106), and the Jeter House and Excelsior Mill (016-5113) in the community of Penola. Only the DeJarnette Lumber Company in Milford is still in operation, though the facility no longer produces excelsior. In a previous examination of the Project corridor, a fifth property was identified in association with excelsior mills in Caroline County: the Woodford Excelsior Company Office (016-0223) (Figure 3-93) (Manning and Salvato 2016). After further research, it was determined that the building previously surveyed as an office for George P. Lyon's excelsior mill in Woodford and the land on which it is located was never owned by Lyon; rather, this building functioned as a post office in the late-nineteenth and early-twentieth centuries (see page 3-54 for further detail). This resource has, therefore, been removed from the proposed Excelsior Industry of Caroline County Historic District.

3.8.1 Historic Context

3.8.1.1 Creation of Excelsior

Although sawdust and wood shavings have been a byproduct of the lumber industry for millennia, the purposeful manufacture of excelsior is a relatively recent trade (Davis 1983:160). The term "Excelsior" began as a brand name but was soon adopted as a general term. Wood used for excelsior had to be lightweight, odorless or pleasantly scented, and free of gum or resin. In the United States, the definition of "wood wool" is reserved for finer grades of excelsior; however, both products are made from slivers of wood removed from logs.

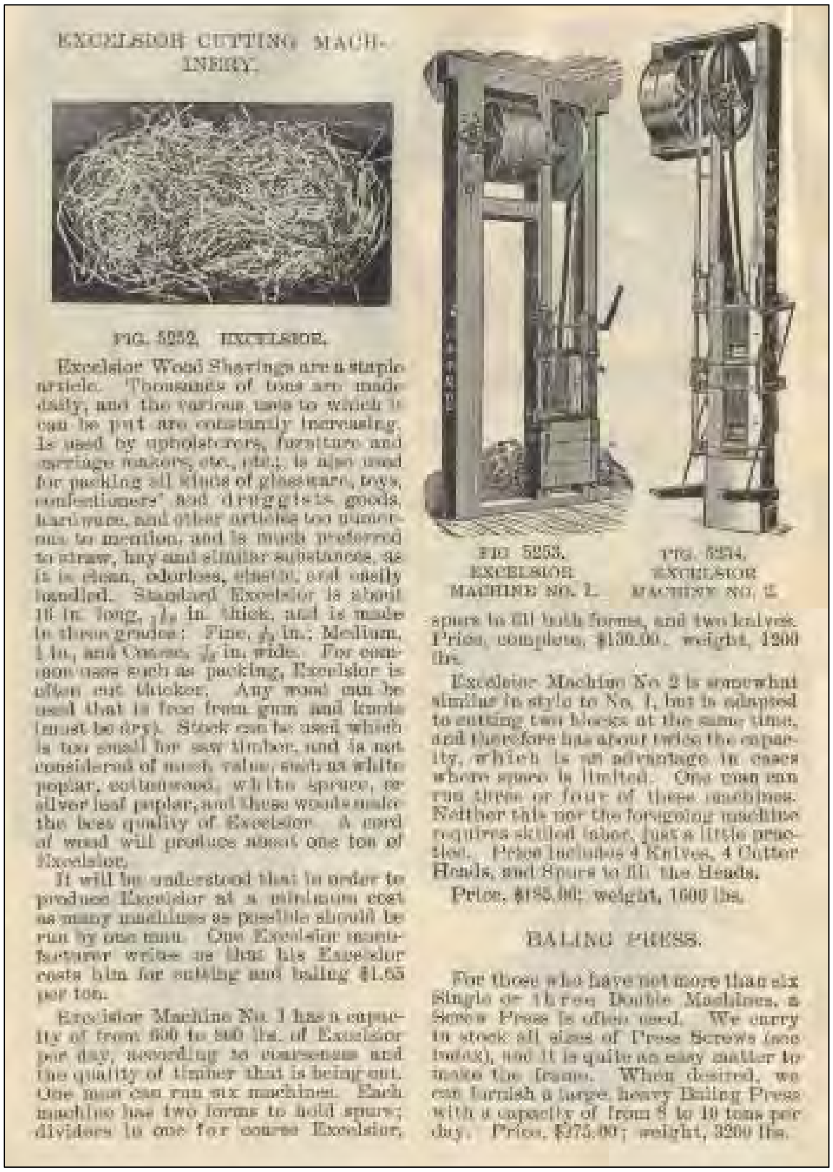
\\DTS2\Main Job\14-015 RAPS\GIS\2018Work\14_015_AH_PhII.mxd | Last Updated: 04.06.2018

Machinery capable of producing fine uniform coils of wood was developed in the United States in the late 1850s (Figure 3-94). Early patents associated with this initial production period often detailed "slivering machines" housed within sawmill complexes or other industrial buildings (Knight 1884:2214). Excelsior mills often functioned in association with lumber operations as they provided a good way to deal with the high volume of waste material unsuitable for sale. Late-nineteenth and early-twentieth century saw mills often operated using steam-powered engines. These engines would be fueled by the same waste product used to create excelsior, yet there were still ample amounts of it to go around. As this steam engine also made saw mills a fairly flammable environment, disposing of the waste in a safe manner was important. One method for this disposal was to use a specialized structure known as a "waste burner."

The waste burner was born out of the need to dispose of the debris of sawmilling in a fire-safe manner. Burners of various types seem to have been in use from the early days of large-scale steam-powered sawmilling, and burners were common features of Michigan sawmills by the late nineteenth century. Patented in 1888, this cylindrical form features a metal plate exterior, thick refractory lining of fire brick that thinned toward the top, and hemispherical wire mesh top. New innovations in sawmill waste burner design took place during the early twentieth century, but Bryant in his 1922 book on *Lumber: Its Manufacture and Distribution* references this as still a standard type of waste burner (as stated in Christensen 2010).

By the end of the nineteenth century, approximately 200 excelsior mills were in production throughout the United States with the bulk of the industry being located in New York, Kentucky, New Hampshire, Wisconsin, and Washington, although mills could be found in every state (Davis 1983:160). The industry peaked in the early-twentieth century.

While excelsior had notable qualities, it also brought great risk. Excelsior mills had a tendency to catch fire and, as result, were essentially uninsurable. The industry also relied heavily on lumber production which, in turn, was dependent on a myriad of conditions such as weather, availability of product, and the economy, among others. Moreover, among the many technological improvements rendered in the mid-twentieth century was an evolution in plastics and other packing materials. By the late 1950s, excelsior for padding and stuffing had largely been replaced by other products and demand was drastically reduced (Davis 1983:160). By 1977, only 12 manufacturers of excelsior were still in operation in the United States, with just five firms producing approximately 96 percent of domestic production (Committee on Finance 1977). Excelsior is still produced in the United States but in extremely limited quantity. It is currently used for items such as cooling pads in home evaporative cooling systems (known as swamp coolers), erosion control mats, and as a raw material for the production of other products such as bonded wood. It also has a large market as landscaping mulch (Kochhar 2016:487).



EXCELSIOR CUTTING MACHINERY.

FIG. 5252. EXCELSIOR.

Excelsior Wood Shavings are a staple article. Thousands of tons are made daily, and the various uses to which it can be put are constantly increasing. Is used by upholsterers, furniture and carriage makers, etc., etc.; is also used for packing all kinds of glassware, toys, confectioners' and druggists' goods, hardware, and other articles too numerous to mention, and is much preferred to straw, hay and similar substances, as it is clean, odorless, elastic, and easily handled. Standard Excelsior is about 18 in. long, [illegible] in. thick, and is made in three grades: Fine, [illegible] in.; Medium, 1 in., and Coarse, [illegible] in. wide. For common uses such as packing, Excelsior is often cut thicker. Any wood can be used that is free from gum and knots (must be dry). Stock can be used which is too small for saw timber, and is not considered of much value, such as white poplar, cottonwood, white spruce, or silver leaf poplar; and these woods make the best quality of Excelsior. A cord of wood will produce about one ton of Excelsior.

It will be understood that in order to produce Excelsior at a minimum cost as many machines as possible should be run by one man. One Excelsior manufacturer writes us that his Excelsior costs him for cutting and baling $1.65 per ton.

Excelsior Machine No. 1 has a capacity of from 600 to 800 lbs. of Excelsior per day, according to coarseness and the quality of timber that is being cut. One man can run six machines. Each machine has two forms to hold spurs; dividers in one for coarse Excelsior, spurs to fill both forms, and two knives. Price, complete, $130.00; weight, 1200 lbs.

FIG. 5253. EXCELSIOR MACHINE NO. 1.

FIG. 5254. EXCELSIOR MACHINE NO. 2.

Excelsior Machine No. 2 is somewhat similar in style to No. 1, but is adapted to cutting two blocks at the same time, and therefore has about twice the capacity, which is an advantage in cases where space is limited. One man can run three or four of these machines. Neither this nor the foregoing machine requires skilled labor, just a little practice. Price includes 4 Knives, 4 Cutter Heads, and Spurs to fill the Heads.

Price, $185.00; weight, 1600 lbs.

BALING PRESS.

For those who have not more than six Single or three Double Machines, a Screw Press is often used. We carry in stock all sizes of Press Screws (see index), and it is quite an easy matter to make the frame. When desired, we can furnish a large, heavy Baling Press with a capacity of from 8 to 10 tons per day. Price, $275.00; weight, 3200 lbs.

FIGURE 3-94: LATE-NINETEENTH CENTURY CATALOGUE SHOWING EXCELSIOR CUTTING MACHINERY (CHARLES A. STRELINGER & COMPANY 1897:966)

3.8.1.2 The Excelsior Industry in Virginia

Although basswood, cottonwood, poplar, and aspen were commonly used in Excelsior production throughout the United States, scrub pine and loblolly pine were the primary species in use in Virginia—both of which were found in abundance in Caroline County (Davis 1983:160; Simmons 1912:55). Virginia pine, also known as scrub pine, has historically been used for "rough construction but warps easily with alternate wetting and drying. The wood has a very long fiber and makes excellent paper pulp" (Powell et al. 2016:27). Lobolly pine "is used for lumber, paper pulp, plywood, poles, pilings and fuel… and is the most important commercial timber tree in Virginia and the Southeast" (Powell et al. 2016:24). It has a medium growth rate, as opposed to the slow growth rate of the scrub pine.

The excelsior industry was slow to start in Virginia. The 1870 United States Census identified just one excelsior manufacturer in the Commonwealth of Virginia at that time; it employed seven people (Virginia Employment Commission 2015). The industry saw a notable increase in the 1890s and 1900s, partially due to notable improvements in the transportation industry as roads and railways were slowly rebuilt and improved after the Civil War. In particular, the robust rail industry in central Virginia promulgated the excelsior business, with a number of factories located between Fredericksburg and Richmond along the bustling RF&P Railroad corridor.

The number of excelsior plants fluctuated greatly—with as few as five operating in the state in 1912 and up to over 20 facilities at their peak in the 1920s (Fredericksburg Free Lance-Star 1929; Simmons 1912:7). During this time period, no fewer than half of the known excelsior mills in the state were located in Caroline County (Simmons 1912:75). In comparison, in 1909 there were 3,511 sawmills operating in the state (Simmons 1912:8).

In Caroline County, the origins of the industry can be traced to the village of Woodford where merchant George P. Lyon established the first excelsior mill in 1896 along the RF&P Railroad (Fisher and Sparenborg 2011:198; Wingfield 1924:26). This excelsior plant created jobs for area residents and stimulated the local economy; in fact, by the end of the first quarter of the twentieth century, Woodford's population had increased more than threefold partially due to the success of the excelsior industry (US Census 1930). Taking advantage of the cheap and readily available pine forests of the county, excelsior production soon became Caroline County's largest industry (Fisher and Sparenborg 2011:198; Wingfield 1924:26). By 1905, George Lyon had established a second mill at Woodford (Fredericksburg Free Lance 1905b). The George P. Lyon Excelsior Company became a distributor as well as a manufacture of excelsior in the region (Figure 3-95). Lyon's mills in Woodford caught fire and were partially or wholly destroyed in 1903, 1904, and again in 1905 (Fredericksburg Free Lance 1904, 1905a; Richmond Times-Dispatch 1903, 1905). As these operations were virtually uninsurable due to this high risk of flammability, the fact that Lyon continued to rebuild and produce excelsior for another 30 years speaks to the continued drive to find a marketable purpose for this byproduct and the success of advertising an array of uses. George Lyon died in 1933, but his estate maintained ownership of the mill for another 20 years. By 1950, the facility was operated under lease by the Woodford Excelsior Company (Fredericksburg Free Lance-Star 1950). The mill employed nine men, contained a main building constructed of wood and iron and a warehouse that housed finished excelsior, and produced 10 tons of excelsior a day, which was shipped throughout the country (Fredericksburg Free Lance-Star 1950). In 1950, the Woodford Excelsior Mill was again destroyed by fire; this time, it was not rebuilt (Fredericksburg Free Lance-Star 1950).

Lyon's success encouraged competition from other lumber-related businesses along the railroad, often in conjunction with lumber and/or planing mills (Figure 3-96). Mills were established at the villages of Guinea, Milford, Penola, and Ruther Glen, as well as in neighboring cities and counties, such as Hanover County, Stafford County, the City of Fredericksburg, and the town of Doswell. The Virginia Excelsior Mill in downtown Fredericksburg, for example, took up an entire city block and contained over half a dozen buildings (Figure 3-97). The excelsior industry throughout the area thrived for decades and was one of the primary employment venues for many Virginians during the tumultuous years of the Great Depression (Powell 2000:16–17).

Excelsior consumption dropped dramatically in the mid-twentieth century, a trend also exhibited in Caroline County. Interestingly, though, among the top five American firms still in operation by the 1970s were Virginia Excelsior Mills (a conglomerate of small excelsior producers, many of which were located in Caroline County) and Taylor Fiber, Inc. of Ruther Glen (Committee on Finance 1977), showing the pervading nature of this commerce on the region. Only one of the excelsior mills in Caroline County is still in operation today, but it stopped producing excelsior decades ago, converting to a lumber processing plant.

3.8.2 Architectural Description

Today's built environment of the excelsior industry in Caroline County represents only a fraction of the buildings, structures, and objects once needed to make the industry thrive. However, despite representing a defunct enterprise, remnants of the most important facility types are represented at the four plants included in the historic district. What was once commonplace are now unique.

Four architectural properties are associated with the excelsior industry in central Caroline County: the DeJarnette Lumber Company (016-5137) in the village of Milford, two excelsior mills in the community of Ruther Glen (016-5105 and 016-5106), and the Jeter House and Excelsior Mill

(016-5113) in the community of Penola. Generally, these four properties have all been abandoned and are now overgrown with vegetation surrounded by stands of young trees. To place the above-ground resources in their specific historical context, a brief history of each property is followed by an architectural description.

3.8.2.1 Ruther Glen Excelsior Mill #1: Caroline Excelsior Company (016-5105)

Excelsior Mill #1 (016-5105), historically known as the Caroline Excelsior Company (1919– 1956) and later as the Taylor Fiber, Inc. (1956–1988), is located near the intersection of Ruther Glen Road (Route 652) and Chesterfield Road (Route 620) in the community of Ruther Glen. In 1919, Thomas H. Chewning and Herman L. Taylor purchased a small tract on the east side of Ruther Glen Road to establish the Caroline Excelsior Company (CCDB 87:84, 107:297). Soon after, Thomas's elder brother, Clarence C. Chewning, bought a one-third interest in the company. The three men operated the manufactory until 1956, when Taylor—who had been working in the excelsior industry since 1917—bought out the interests of his partners (CCDB 87:340, 141:369). According to the deed, Taylor's purchase included "the complete excelsior manufacturing plant, machinery, tools and equipment thereon and including the motor trucks and equipment but excluding the operating inventory" (CCDB 141:369). In 1960, Taylor turned over the company to his son, H. Ashton Taylor, who had worked with his father in the family business for at least two decades prior (CCDB 149:76). The younger Taylor re-chartered the company as Taylor Fiber, Inc., established "for the wholesale and retail business of producing and selling excelsior and other kindred products" (Fredericksburg Free Lance-Star 1960). By 1977, Taylor Fiber, Inc. was one of only 12 manufacturers still in operation in the entire country (Committee on Finance 1977). As late as 1982, the factory still employed approximately 30 people (Fredericksburg Free Lance-Star 1982). The company finally dissolved in 1988 (CCDB 323:187).

Excelsior Mill #1 is west of Ruther Glen. A dirt and gravel drive runs through the center of the lot connecting an entrance on Chesterfield Road with another on Ruther Glen Road, with the majority of the buildings lining the drive on either side. The parcel currently contains a conical teepee burner and six buildings of varying materials, massing, and size (Figure 3-98 through Figure 3-100). The circa-1950 teepee waste burner rests on a poured-concrete foundation. The structural system is constructed of sheet metal over a metal frame lined with corrugated metal. The structure is open at the top, and vents and an access doorway are found near the base. The funnel-shaped attachment located at the southeast corner of the burner is commonly known as a cyclone or dust precipitator (Mihalyo 1997:32). The function of the sawdust cyclone "was to funnel planar shavings and small particles of sawdust into the burner. These particles were blown through a pipe into the cyclone from the mill itself. Once inside the cyclone, the chips, dust, and shavings were then drawn by gravity into the core of the burner" (Mihalyo 1997:32). Four frame buildings—two large warehouses, a small tool shed, and a machine shop—and one concrete-block warehouse are also associated with this property, all of which appear to have been constructed between 1950 and 1970. The concrete-block warehouse and the frame warehouse with the loading deck are connected by a covered walkway accessed by a poured-concrete ramp. All of the buildings are vacant and in deteriorating condition. Historically, a house appears to have been situated just west of the mill complex, but this building has been demolished.

3.8.2.2 Ruther Glen Excelsior Mill #2: Ruther Glen Excelsior Company (016-5106)

Excelsior Mill #2 (016-5106) is located at the eastern terminus of Chesterfield Road in Ruther Glen. At the turn of the century, the land on which this excelsior mill is located was part of the 244-acre Ruther Glen Farm, also known as the "Burruss Tract," bounded on the south by the RF&P Railroad (CCDB 68:2730). The land was purchased from C.V. Burruss by Taliaferro Hunter in 1901, who operated a sawmill and lumber business on the property with his partner, George W. Quarles, under the name of T. Hunter & Co. (CCDB 69:297; Fall 1989:331). Upon his death in 1911, the land transferred to his five sons. As Hunter died intestate, a lawsuit ensued regarding land ownership. The land was subsequently sold at public auction to Cora Blanton whose husband, Thomas, happened to own and operate the Ruther Glen Excelsior Company on the adjoining property (CCDB 69:297, 80:316). The now-expanded excelsior company was in operation until 1956 when the business was dissolved after an anti-trust complaint was filed with the Federal Trade Commission (Federal Trade Commission 1960). Interestingly, the complaint was filed by fellow-excelsior operators H.L. Taylor, H. Ashton Taylor, G.K. Coleman, Sr., and G.K. Coleman, Jr. who were "engaged in the manufacturing and selling of excelsior […] under the name of Ruther Glen Excelsior Company, with their place of business at Ruther Glen, Virginia" at that time—the same property listed as Ruther Glen Excelsior Mill #1 above (Federal Trade Commission 1960:457).

The former site of Ruther Glen Excelsior Mill #2 consists of three buildings and a teepee burner on an overgrown lot situated just southwest of a millpond (Figures 3-101 and 3-102). All of the buildings and structures associated with the mill are vacant and in a deteriorated condition. Similar to the teepee burner located at Excelsior Mill #1, the cone-shaped burner at this mill appears to date from 1950. Not fully visible during the current survey due to limited property access, this structure is clad in sheet metal over a metal frame. Three warehouses remain extant at this mill site. The largest is a concrete block building with a flat roof. Just to the west is a post-1966 frame warehouse clad in corrugated metal with a front gable roof; the roof is covered in standing-seam metal. The third and smallest warehouse, located to the north, was also not accessible during this survey.

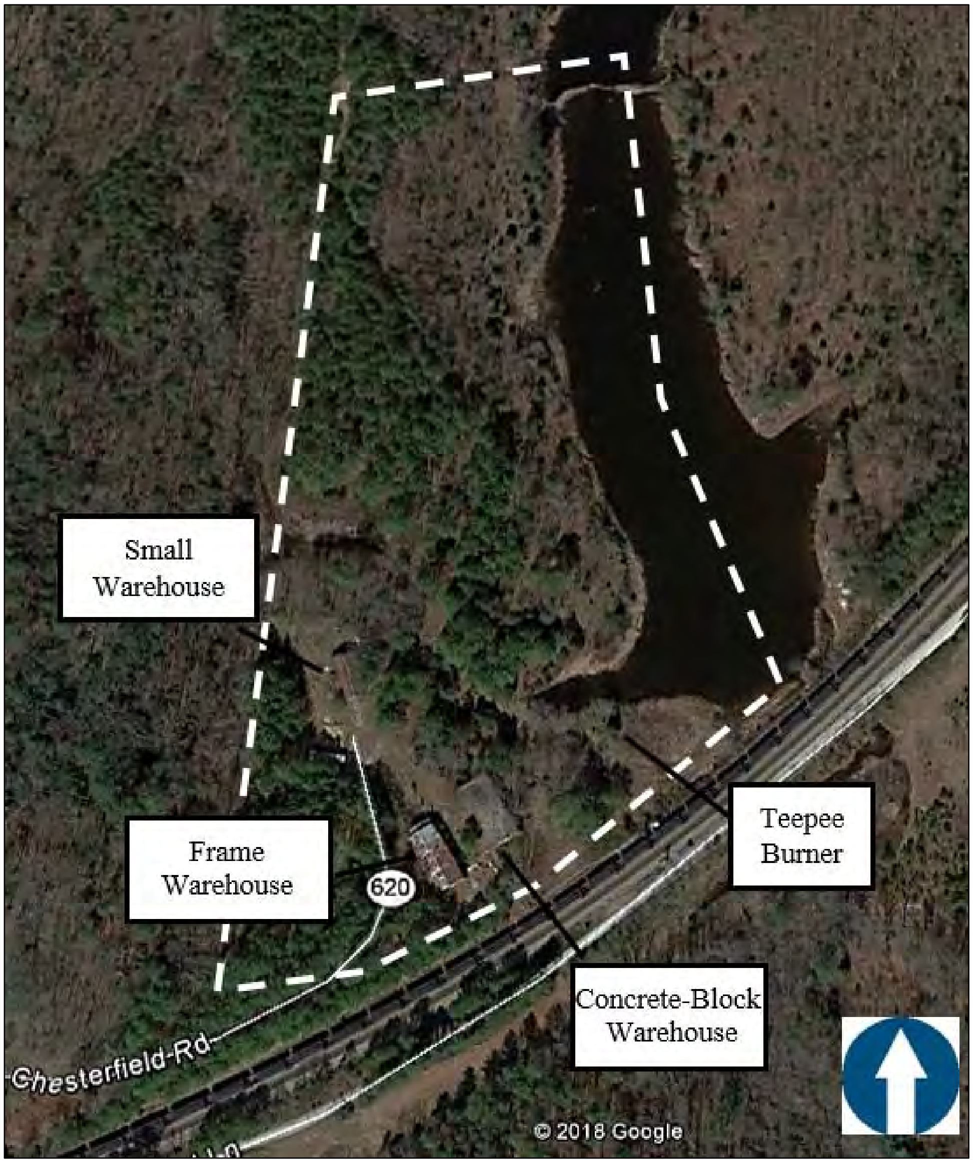

FIGURE 3-101: SITE PLAN OF RUTHER GLEN EXCELSIOR MILL #2 (GOOGLE EARTH 2018)

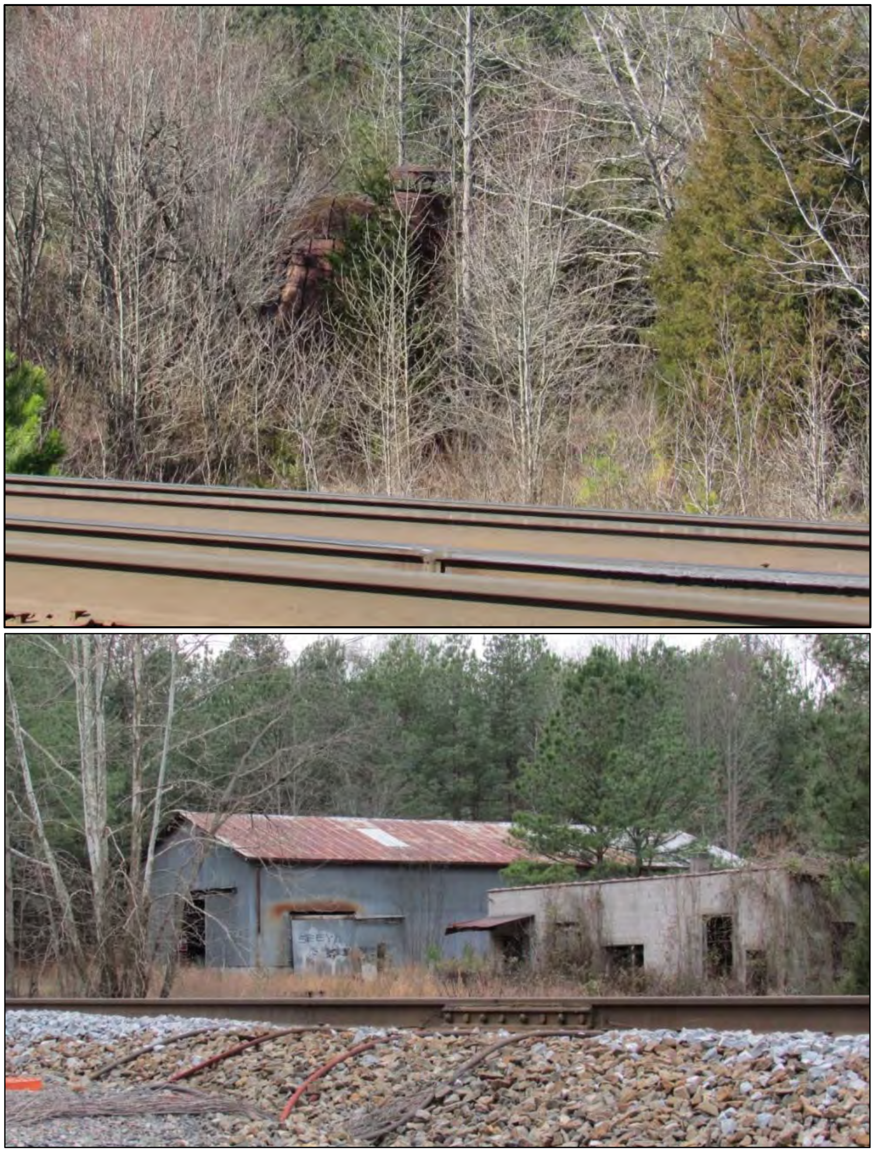

FIGURE 3-102: SAMPLE OF BUILDINGS AT RUTHER GLEN EXCELSIOR MILL #2. TOP: TEEPEE BURNER. BOTTOM: FRAME WAREHOUSE (LEFT) AND CINDER BLOCK WAREHOUSE (RIGHT).

3.8.2.3 Jeter House & Excelsior Mill (016-5113)

What would become the Jeter Excelsior Mill parcel was purchased by brothers William R. Jeter and T.B. Jeter in 1903 (CCDB 70:255). Capitalizing on the sudden and successful growth of the excelsior industry in the early-twentieth century, the brothers constructed an excelsior plant along the RF&P Railroad. The enterprise was a success. In 1916, T.B. Jeter sold his interest in the land and the business to his brother, William, who continued to operate the Jeter Excelsior Mill for several decades (CCDB 84:239; Wingfield 1924:291). Through the success of the business, William and his family constructed a new dwelling adjacent to the excelsior enterprise around 1930. Upon his death in 1943, William deeded the mill to his son, Benjamin, who continued to run the family business until his own death in 1978 (i.e., Federal Trade Commission 1960:457). Records suggest that the excelsior company was disbanded shortly thereafter.

Today, the Jeter House & Excelsior Mill located at 16111 Polecat Lane in Penola is a residential and light-industrial mill complex (Figures 3-103 and 3-104). All of the buildings are vacant. The property is heavily wooded, with thick brambles and an unpaved drive heading north from Polecat Lane to the primary resource. The excelsior mill and associated structures are concentrated in the east portion of the site. The primary resource is the Jeter House, a two-story, three-bay dwelling constructed around 1930 with no discernable style. The foundation is not visible; the frame structural system is clad in weatherboard. The side gable roof is covered in corrugated metal sheeting.

A series of modest additions have been made to the rear elevation over time, and the primary entrance and flanking two-over-two, double-hung-sash windows have been enclosed in a screened porch. Although the house is the most prominent building on today's landscape, the parcel also contains many resources that hark back to the use of the land as the Jeter Excelsior Mill. Built between the start of the business in the first decade of the century and the death of founder William Jeter, the property also contains a saw mill, drum waste burner, possible company store or secondary dwelling, a machine storage shed, and three other storage buildings of varying size. In addition, the remains of what appears to be a portable steam engine, almost certainly associated with milling operations, are located at the northeast corner of one of these storage sheds. Perhaps the most recognizable feature of the mill property is the circa-1925, drum-style, wood-waste burner located at the southeast corner of the property and connected to the large mill building via a metal chute. The burner is constructed of curved sheets of metal supported by an external metal frame. The top of the burner is open and braced with a set of parallel metal bars. The interior is partially lined with fire brick.

3.8.2.4 DeJarnette Lumber Company (016-5137)

Milford, the site of the DeJarnette Lumber Company, was a prominent crossroads community along the RF&P Railroad. The town grew in the first half of the twentieth century as a rail shipping center. Recognizing the expediency of producing goods near the rail stop, numerous businesses were established along the main thoroughfare in the early-twentieth century including the Wilson Lumber Company and the W.N. Blatt & Co. excelsior mill, later known as the Milford Excelsior Company (CCDB 112:294; Fredericksburg Free Lance 1908; Reading Eagle 1914). In 1945, J.W. DeJarnette bought the Wilson Lumber Company and renamed it the DeJarnette Lumber Corporation (CCDB 122:12, 160:111). Ten years later, he acquired the Milford Excelsior Company—located on the adjacent parcel—and commenced producing excelsior under the DeJarnette Lumber name. The mill grew to be one of the largest excelsior enterprises in the area (Fredericksburg Free Lance-Star 1995:A1). Although the DeJarnette business was bought and sold several times between the 1980s and 2000, it was purchased back by the DeJarnettes in 2001 and renamed the DeJarnette Lumber Company (CCDB 559:113). The company is still in operation (Figure 3-105).

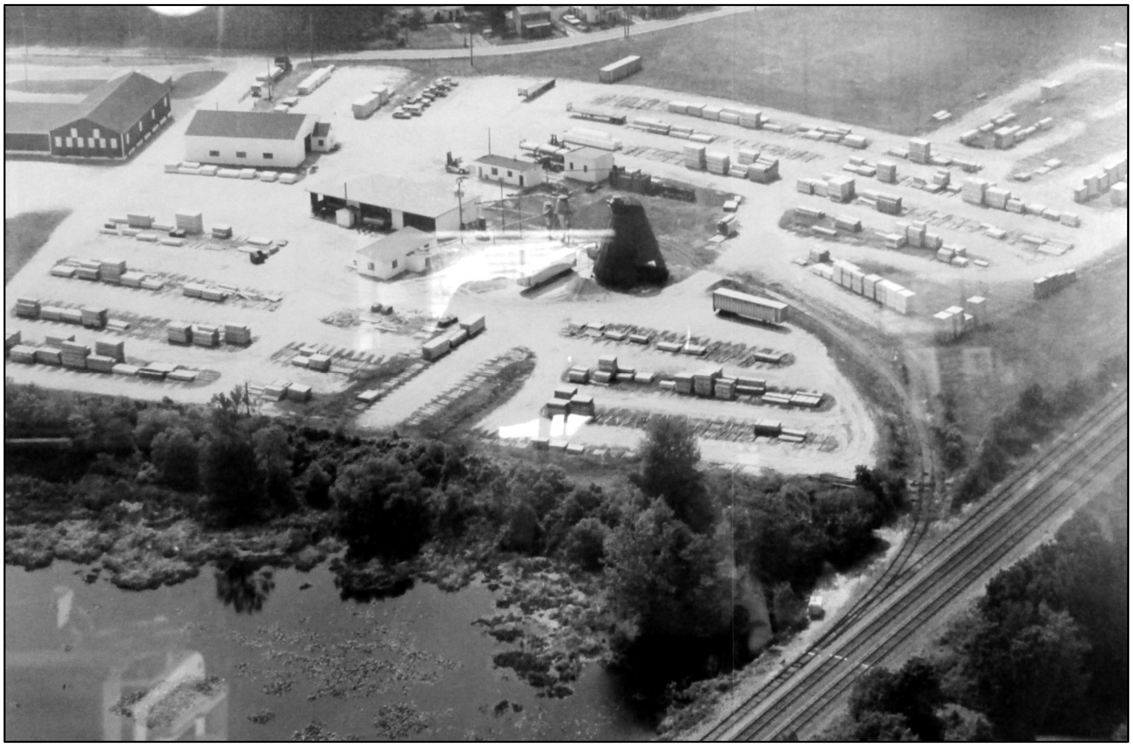

FIGURE 3-105: AERIAL IMAGE OF THE EXCELSIOR OPERATION AT THE DEJARNETTE LUMBER COMPANY TAKEN IN THE 1960S, LOOKING SOUTH (DEJARNETTE LUMBER COMPANY 1960S)

Although the DeJarnette Lumber Company no longer produces excelsior, numerous extant resources once associated with the business can still be found within the lumber company complex (Figures 3-106 and 3-107). The most prominent resource is a large circa-1940 teepee or wigwam-style, wood-waste burner (Figure 3-108). The burner measures an estimated 50 feet tall and approximately 35 feet in diameter at the base and has a conical shape formed by metal plates mounted to an exterior metal frame of compression rings. The base of the burner is open, and the top is covered by an open metal frame that would have once been covered with metal mesh, referred to as a spark arresting screen (Mihalyo 1997). Other resources include a large wood processing building (which is still referred to as the planer building today despite a move away from excelsior), a sawdust cyclone, a re-saw/fine-planning building, a lunch room/tool shop, a storage building, an office/warehouse, and a boiler house.

3.8.3 NRHP Evaluation

In 1896, local merchant George P. Lyon established Caroline County's first excelsior mill at the village of Woodford along the RF&P Railroad (Fisher and Sparenborg 2011:198; Wingfield 1924:26). The excelsior plant was a success, employing numerous residents and stimulating development of the region. Lyon's success encouraged competitors to establish their own excelsior mills in other small communities all along the RF&P Railroad, sometimes in conjunction with lumber mills, in order to take advantage of the cheap and readily available pine forests of the county. Excelsior soon became Caroline County's largest industry (Fisher and Sparenborg 2011:198; Wingfield 1924:26). One source estimated that in 1924 there were more than 20 excelsior mills in Virginia, with the bulk of those being located in Caroline County (Wingfield 1924:27).

Extant resources associated with the excelsior industry include the remains of mills at Milford (016-5137) and Penola (016-5112) and two mills at Ruther Glen (016-5105 and 016-5106). Several of these facilities remained active into the 1950s through 1970s, producing excelsior or converting to lumber manufacturing. The mill at Milford still operates today as the DeJarnette Lumber Company. The excelsior business was a direct impetus for the establishment and growth of numerous small communities along the RF&P Railroad in Caroline County, and it was a key market in the area economy. The excelsior resources have a notable connection to the history and development of the county physically, economically, and socially. For these reasons, it is recommended that the Excelsior Industry of Caroline County Historic District is eligible for the

NRHP under Criterion A for its association with a significant event. The district has no known associations with a significant individual, thus it is suggested that the district is not eligible for the NRHP under Criterion B.

The proposed historic district consists of four properties: an excelsior mill with small brick-lined cylindrical burner and three excelsior mills with extant teepee burners ranging in height from approximately 25 feet to approximately 50 feet. Many of the buildings associated with the mills are no longer extant, having been replaced by more modern facilities or fallen into ruins after the mills closed; however, the mills never had substantial buildings to begin with, given that the bulk of the manufacturing process took place outdoors or in small rudimentary shelters. The most prominent resources associated with Caroline County's excelsior industry are large, metal, wood-waste burners.

Waste burners were present at nearly every sawmill and excelsior mill in the country prior to the mid-twentieth century. Processing wood products created a large amount of waste in the form of sawdust, bark, small branches, and other debris, and waste burners were the preferred method for dealing with the problem. Most burners consist of a hollow structure with an open top covered with metal mesh into which wood waste was dumped and incinerated. Burners were constructed in a variety of sizes and forms, including a cylindrical silo design and a conical design commonly referred to as a teepee, wigwam, or beehive burner due to its distinct shape. Wood waste burners continued to be used through the mid-1970s, when they were phased out as part of the Clean Air Act of 1970 and often dismantled (National Archives and Records Administration 2009:751). In Caroline County, three of the former excelsior mills retain extant teepee burners of varying sizes; these teepee burners comprise three of the four recorded teepee-style burners in Virginia. A former mill near Penola retains the remains of what appears to be a short silo or drum-style burner. All of these resources are included in the proposed district.

Although many of the buildings associated with these properties are in various states of neglect and are generally unremarkable in and of themselves, the extant waste burners are significant structures that embody the distinctive characteristics of a type. Buildings associated with excelsior production were similar to those seen at twentieth-century saw mills, including warehouses, tool shops, and a building to house the large saws, steam engines, and associated machinery that milled the lumber and carried its waste product to the teepee burners. Although the historic integrity of design, materials, and workmanship of these resources have been diminished by disuse, exposure to the elements, and some minor vandalism, each of the complexes retain a high level of integrity of location, setting, feeling, and association. Therefore, it is recommended that the Excelsior Industry of Caroline County Historic District is eligible for the NRHP under Criterion C for its architectural merit. As an architectural resource, the district was not evaluated for inclusion under Criterion D.

In sum, it is **recommended that the Excelsior Industry of Caroline County Historic District is eligible for the NRHP under Criteria A and C.** The proposed boundaries should include the four parcels associated with this discontiguous district, and the period of significance is recommended to be 1925 to 1960 (Figure 3-109).

3.9 MILFORD HISTORIC DISTRICT (016-5136)

The Milford Historic District (016-5136) highlights an unincorporated community in rural Caroline County, Virginia that was originally established in the late-eighteenth century as a tobacco trading center. The village is located at the intersection of Colonial Road (Route 722), Antioch Road (Route 628), and the former tracks of the RF&P Railroad (Figure 3-110). Milford was one of five original stations in Caroline County along the RF&P Railroad and soon became the largest of the small communities in the county situated along the route. Today, the town is composed of residential, commercial, and industrial buildings that date to the late-nineteenth through mid-twentieth centuries. The historic district is currently composed of 23 contributing resources and one non-contributing resource. Trains still run through Milford as part of CSXT's RF&P Subdivision and the Amtrak system.

3.9.1 Historic Context

In 1607, approximately 250 members of the Dogue tribe (sometimes spelled Doeg or Taux) of Algonquian-speaking Native Americans established a settlement along the Mattaponi River in the location of what is now Milford, referred to as Doguetown (Fall 1989:185). Later, an important tobacco trading warehouse and a fort were established at Doguetown to take advantage of its location along the Mattaponi River for trade and transportation (Fall 1989:185; Fisher and Sparenborg 2011:147). In the eighteenth century, a tavern that also served as a slave-trading center operated at the site (Fall 1989:187). On November 2, 1792, the Virginia Assembly passed an act to formally "establish a Town and inspection of Tobacco on the lands of John Hoomes, in the county of Caroline," directing that the town be "laid off into lots of half an acre each, with convenient streets" (Fall 1989:189; Fisher and Sparenborg 2011:147). They named this new town Milford after a nearby plantation.

When the RF&P Railroad opened its line through Caroline County in 1836, the stop at Milford was one of only five in the county at that time (Wingfield 1924:34). The first railroad station at Milford was constructed the following year, and the town gained in importance (Figure 3-111) (Fisher and Sparenborg 2011:147).

The first post office was established at Milford in 1849, with mail arriving by train several times a day (Fall 1989:189; Fisher and Sparenborg 2011:147). Interestingly, an 1851 business directory offers no listings for merchants or other professionals at Milford, although other communities in Caroline County such as Bowling Green, Port Royal, Sparta, and Ruther Glen were well represented (Thomson 1851:117). In 1855, Milford was described as a "post-village" located 38 miles from Richmond (Fall 1989:191). During the Civil War, Milford was described by various visitors as "a rundown aggregation containing a depot, and engine house, and a handful of dwellings and outbuildings" and as containing "one railroad station, a commodious hotel, a few tumble-down out houses, with a whiskey distillery" (Figure 3-112) (Fisher and Sparenborg 2011:148). By 1877, the community boasted the only telegraph office and Railway Express Station in the county as well as a small number of businesses, including two general merchants, a grist mill, a sawmill, and two physicians (Fall 1989:191; Fisher and Sparenborg 2011:148).

NOTICE.—On and after the 1st of June, the Day Train will stop only at the following places for passengers:

Sinton's, Hungary, Mt. Road, Kilby's Mill, Slash Cottage, Taylorsville, Junction, Chesterfield, Coleman's Mill, Pole Cat, Milford, Woodford's Lane, Gaines', Bullock's, Fredericksburg, Potomac Run and Brook's Station.

S. RUTH, Agent for Transportation.
Office R., F. & P. Railroad Company,
May 26th, 1854.
my 27—ts

FIGURE 3-111: STOPS ALONG THE RF&P RAILROAD IN 1854 (RICHMOND DISPATCH 1854)

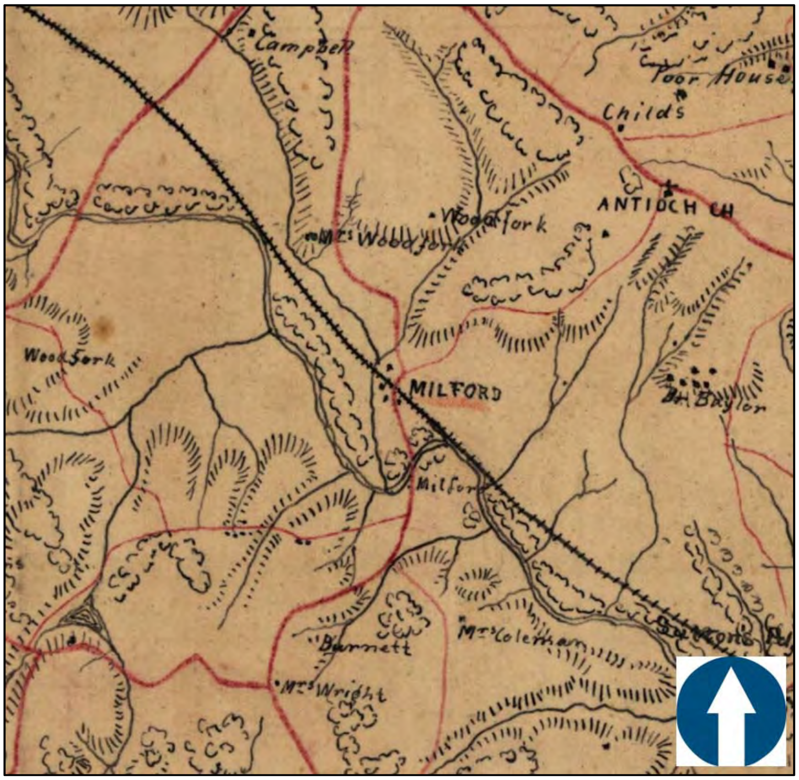

FIGURE 3-112: CIRCA-1864 MAP SHOWING THE COMMUNITY OF MILFORD ALONG THE RF&P RAILROAD (CONFEDERATE STATES OF AMERICA 1864) (MAP NOT TO SCALE)

By 1882, the Milford Hotel had been constructed in the village (Fall 1989:191). The community continued to grow, and by 1884 included four general merchants, a flour mill, three sawmills, two physicians, a saddle and harness maker, an attorney, and the hotel (Fall 1989:192). Milford was incorporated by the Virginia Assembly in 1887, and by 1897, the population had reached 100 (Fall 1989:192). Several large, Victorian-era styled dwellings were constructed during this period, reflecting the new prosperity of the town (Figure 3-113). A new passenger depot was constructed in 1891, and a freight depot was built the following year (Figures 3-114 and 3-115) (Fisher and Sparenborg 2011:148). All steam engines were required to stop at Milford to take on water, allowing for the development of a thriving community to service passengers and facilitate the movement of goods. Commodities such as pulp wood, lumber, excelsior, fertilizer, and feed were all shipped into or out of Milford via the railroad (Caroline County 2010:5-7). One of the commercial enterprises established during this period was Blatt's Store (016-0272), constructed circa 1890, which remained in business into the twenty-first century (Figures 3-116). The Milford Presbyterian Church (016-0264) was also constructed in the late-nineteenth century and still stands today, although it has been converted to residential use (Figure 3-117).

In 1906, Milford businesses included four general merchants, one wholesale grocer, two blacksmiths/wheelwrights, a livery stable, and an excelsior mill (Fall 1989:193). A brick manufacturer and painting company were added to the offerings by 1910 (Fall 1989:193). In 1913, a sumac factory was established on the east side of the RF&P Railroad and soon became the largest such facility in the United States (Fall 1989:193). At the factory, sumac branches were boiled to create an extract that was used to tan leather and process textile colors (Fisher and Sparenborg 2011:149).

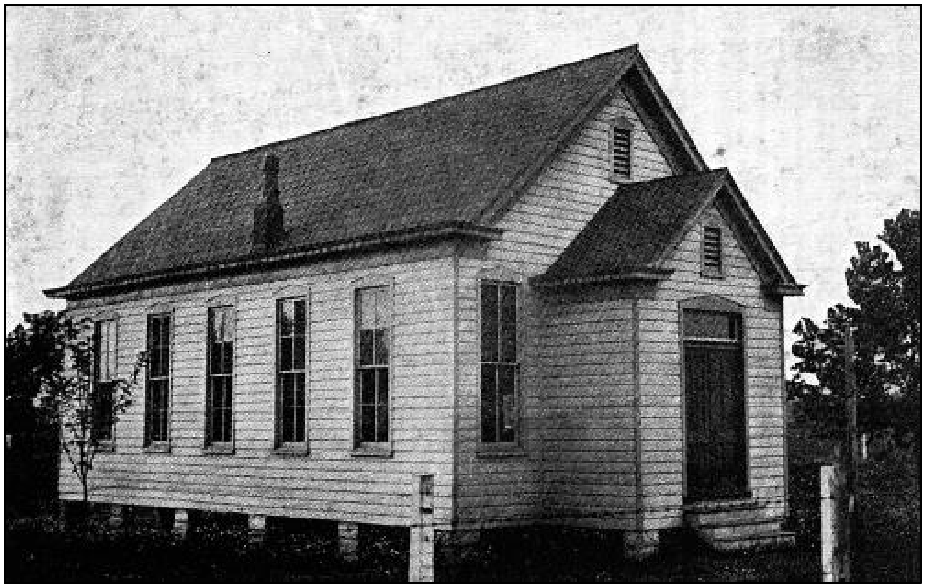

FIGURE 3-117: HISTORIC 1910 PHOTOGRAPH OF MILFORD PRESBYTERIAN CHURCH (016-0264) (GRAY 1985:59)

The 1920s were "boom times" for the small village, with businesses such as the Milford State Bank, Wilson Lumber Company (which specialized in oak flooring), and several other stores and small factories in operation (Fisher and Sparenborg 2011:149). Blatt's Store even provided a gasoline pump for automobiles and tractors (Fisher and Sparenborg 2011:149). During World War I, soldiers traveling to Fort A.P. Hill debarked at Milford and the town swelled to a population of 400 people (Fisher and Sparenborg 2011:149).

After the war, Milford's prosperity began to wane and stores and businesses started to close (Figure 3-118). Some attempts to cater to increasing automobile traffic, which was quickly replacing the railroad, were undertaken by local businesses. A hand-operated gasoline pump was installed at Blatt's Store in the 1920s, and the Blatt Chevrolet auto dealership opened around 1950 (016-5145). Soon, however, the town was bypassed by Route 207, and trains only stopped at the village if requested. In 1955, the passenger depot was demolished, and the water tower was removed soon after (Fisher and Sparenborg 2011:150). The freight station was closed in 1973 and was later converted to residential housing (Fisher and Sparenborg 2011:150). With the exception of the demolition of a few commercial and industrial buildings and the construction of a new post office and single-family dwellings in the mid-twentieth century, the overall size, setting, and layout of Milford is virtually unchanged (Figures 3-119 and 3-120).

3.9.2 Architectural Description

The village of Milford is a representative example of a small rural community in Caroline County that experienced substantial growth during the nineteenth century with the coming of the railroad. Today, the village still contains the old freight depot, a lumber factory with teepee burner, several commercial buildings (mostly vacant and in disrepair), a modern post office, a corner store still in operation, and a number of single-family dwellings dating from the late-nineteenth century through the mid-twentieth century. The Milford Hotel and the Milford Presbyterian Church have both been converted to residential use.

Although Milford has lost some of its buildings from the late-nineteenth and early-twentieth centuries, most notably the Milford Passenger Depot, it has retained several important buildings such as the Milford Freight Depot (016-0266), which still stands at the center of town and is one of only two village depots remaining in the county (Figure 3-121). The circa-1940 DeJarnette Lumber Company (016-5137), the site of an earlier excelsior and/or lumber mill located immediately adjacent to the tracks, is still in operation and retains its prominent teepee waste burner, which has become a local landmark (Figure 3-122). Other contributing properties in the Milford Historic District include the former Milford Presbyterian Church (016-0264), the former Milford Hotel (016-0262), the circa-1910 Milford State Bank (016-0270), the circa-1890 Blatt's Store (016-0272), a circa-1950 Chevrolet dealership (016-5145), seven additional commercial buildings and warehouse complexes, the 1960 Milford Post Office (016-5147), and eight single-family dwellings ranging in date from circa 1880 to 1942 and reflecting the Queen Anne, Craftsman, and vernacular styles (Figures 3-123 through 3-126). In total, 23 resources contribute to the Milford Historic District. One additional property, the previously surveyed circa-1890 Gray Campbell Inn/Schalls Furniture Refinishing and Repair (016-0263), is no longer extant and is considered a non-contributing resource.

3.9.3 NRHP Evaluation

Milford is a small rural community established in the eighteenth century as a tobacco trading center that continued to prosper in the nineteenth and early-twentieth centuries with the construction of the railroad. Milford has largely avoided modern development and still retains its rural character and placement along the railroad. A wide range of contributing resources survive from the late-nineteenth and early-twentieth centuries; and therefore, this community possesses a high level of integrity of location, setting, feeling, and association. However, the historic integrity of some of these resources has been negatively impacted by the installation of replacement materials, conversion of non-residential resources to residential use, deferred maintenance, vacancy and neglect, as well as the demolition of important resources such as the passenger depot and sumac factory, resulting in a low to moderate degree of integrity of design, materials, and workmanship.

In order to be considered eligible for the NRHP under Criterion A, a resource "must be associated with one or more events important in the defined historic context;" the associated can be one (or both) of two types of events: 1) a specific event marking an important moment in American prehistory or history and 2) a pattern of events or a historic trend that made a significant contribution to the development of a community, a state, of the nation (Shrimpton et al. 1990). The community of Milford grew from the effects of multiple industries popularized in Caroline County throughout its history, mainly tobacco during the eighteenth century, railroad transportation in the mid-nineteenth century, and excelsior at the turn of the twentieth century. The effects were long lasting and the marks are still seen throughout the village through its extant contributing resources. As such, the Milford Historic District is recommended as eligible for the NRHP under Criterion A for its association with industry and transportation at the local level.

For a resource to be considered eligible under Criterion B, it must be associated with a person who is "individually significant within a historic context" and has "gained importance within his or her profession or group" (Shrimpton et al. 1990). The district has no known association with any significant person or group; and therefore, is recommended not eligible for the NRHP under Criterion B.

Although first settled in the seventeenth century, Milford gained importance as a tobacco town in the eighteenth century and grew further still as it became one of five railroad stops (Penola, Milford, Woodford, Ruther Glen, and Guinea) in the county creating small communities around them. Milford eventually became the largest of these five railroad communities and continues to retain a majority of the historic fabric from that prosperous period through its contributing civic, commercial, and residential resources that reflect a variety of architectural styles locally popular during that period, such as Queen Anne, Craftsman, and vernacular forms. This is in contrast to the other four villages, primarily Penola and Woodford (discussed further on page 3-43 of this report) that have had a notable loss of contributing resources. Taken as a whole, the Milford Historic District is a distinctive example of a railroad community in Caroline County, and therefore, recommended eligible for the NRHP under Criterion C at the local level. As an architectural resource, the Milford Historic District was not evaluated under Criterion D.

In sum, the Milford Historic District (016-5136) is **recommended eligible for listing in the NRHP under Criteria A & C.**

The recommended period of significance for the Milford Historic District is focused primarily around its revitalization of the village from the arrival of the railroad in 1836. Because it continued to be associated as a freight railroad stop well into the 1970s, the DC2RVA Team applied the NPS 50-year-rule for defining periods of significance for resources "where activities begun historically continued to have importance and no more specific date can be defined to end the historic period" (NPS 1997). As such, the period of significance spans from 1836 to 1968. It also is within this period that all of the contributing resources were constructed. The proposed district boundaries encompass approximately 43 acres of land primarily on the east side of the railroad tracks. Beginning at the northern termination of Alliance Drive, the boundaries continue south to encompass several properties on the southeast side of Colonial Road (Parcel ID 56C-8-1, 56C-8-2, 56C-A-9, and 56C-A-11) and east and west sides of Antioch Road (Parcel ID 56C-8-3, 56C-8-5, 56C-9-2, 56C-10-A, 56C-A-10B, 56C-A-12, 56C-A-13, 56C-A-14, 56C-A-15, 56C-A-16, 56C-A-17, and 56C-A-18) then turns west to cross the railroad tracks just north of Nelson Hill Road to include several parcels on the west side of the railroad tracks (Parcel ID 55-A-99, 55-A-101, and 55-A-102). It then continues north to include properties on the northwest side of Colonial Road and Alliance Drive (Parcel ID 56C-A-4, 56C-A-6, 56C-A-7, and 56C-A-8) (Figure 3-127).

3.10 MILFORD STATE BANK (016-0270)

Milford State Bank, is located on the northeast side of Antioch Road, east of the railroad tracks within the heart of Milford (016-5136) in Caroline County. The bank is situated close to the roadway on a narrow, rectangular lot measuring approximately 0.28 acres, with the northeast portion of the parcel containing an open lawn with a few mature trees (Figure 3-128). A picket fence bounds the property on the southwest, and metal chain-link fencing encloses the northeast portion of the parcel. The property is surrounded on the northwest and northeast by residential properties and on the southeast and southwest by commercial properties. No secondary resources were observed. The property is accessed by a gravel drive extending from the road on the northwest side of the building, leading to a parking area to the northeast of the dwelling.

3.10.1 Historic Context

The small community of Milford was established in 1792 and experienced growth when the RF&P Railroad opened its line in 1836 (Fisher and Sparenborg 2011:147). Because of the rail line, Milford experienced a boom of store and factory development. The increase in population and economic prosperity brought about a need for a local bank (Fisher and Sparenborg 2011:149). For more information about Milford, see page 3-104.

The Milford State Bank is located on land that was owned by T.E. Campbell, who sold 2 acres to Milford State Bank, Inc. in 1912. The parcel was described as:

> Part of the residence lot of said Campbell, which he purchased of C.L. Collins and Wife…upon the condition that the said party of the second part erect on said lot a bank building, but no other business building, and start a bank therein, and upon failure so to do, the said lot of land is to revert to said T.E. Campbell upon his repayment of the purchase price of said land and the cost of any bank building that may be erected thereon [CCDB 79:153].

The stipulations for erecting a bank were met, making it the first and only bank in Milford, and in 1929 the land and property was acquired by Union Bank and Trust Company by merger with Milford State Bank, Inc. (CCDB 120:308).

T. Benjamin Blatt bought the bank building in 1943 from the Union Bank and Trust Company. By this time, the bank lot had been reduced to 0.28 acres (CCDB 120:308). At this point, archival research indicates that the building no longer continued to operate as a bank, though it is not clear what it was used for after 1943. The Blatts were a prominent family in town, as they owned a successful general store and in 1950 opened a Chevrolet dealership, which later became their primary business (Figure 3-129) (Fisher and Sparenborg 2011:149; Gray 1985:131).

In 1973, T. Benjamin Blatt sold the 0.28 acre lot with the bank building on it to Joseph and Elizabeth Alvey, who sold the property five years later to real estate brokers Stephen Lohr and Donald Pitts (CCDB 205:180, 249:303). In 1999, they sold the property to Hardeep S. Dhillon who owns it today and has repurposed the building as apartments. Dhillon owns several buildings in Milford and is working with the community to renovate them (Fredericksburg Free Lance-Star 2015).

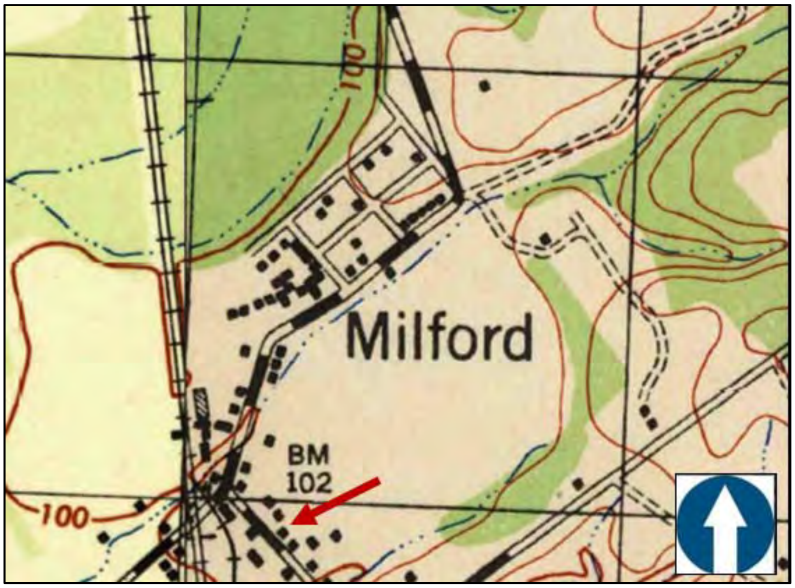

FIGURE 3-129: LOCATION OF MILFORD STATE BANK ON 1942 COMBINED TOPOGRAPHIC MAP OF MILFORD (USGS 1942B, 1942C) (MAP NOT TO SCALE)

3.10.2 Architectural Description

3.10.2.1 Primary Resource Exterior

The Milford State Bank, located at 15461 Antioch Road, is a two-story brick building constructed circa 1910 in the Classical Revival style (Figures 3-130 through 3-132). The building has a continuous, poured-concrete foundation and a masonry structural system of red brick laid in an American bond. The building's façade (southwest elevation) is divided into five distinct bays via brick pilasters with plain capitals of concrete. Courses of soldier and rowlock brick on the northwest and southeast elevations create decorative bands that horizontally break up the wall surface. The building is covered by a low-pitched, asphalt-shingled, hipped roof with boxed eaves containing a denticulated cornice that appears to have been replaced with aluminum dentils (Figure 3-133). A painted brick parapet wall caps the southwest elevation (Figure 3-133). An interior-end, brick chimney is centered on the northwest elevation and an additional brick chimney can be seen at the juncture of the northeast elevation and a rear addition.

The building has a pair of slightly recessed entrances on the façade, one in each of the outermost bays (west and south corners). Each entrance contains a double-leafed wood door with full rectangular lights topped by a single-light, wood-frame transom and concrete jack-arched lintels with keystones. Decorative wood paneling embellishes the inset sides of each entrance. Other fenestration includes single, one-over-over, vinyl, replacement windows. Window openings at the façade feature concrete sills and jack-arched lintels and in the outermost bays are further elaborated by decorative brick aprons (Figure 3-134). The central bay in the second story of the façade once contained a window but has since been removed and the space filled with brick.

FIGURE 3-130: SITE PLAN OF THE MILFORD STATE BANK (CAROLINE COUNTY 2018) (NOT TO SCALE)

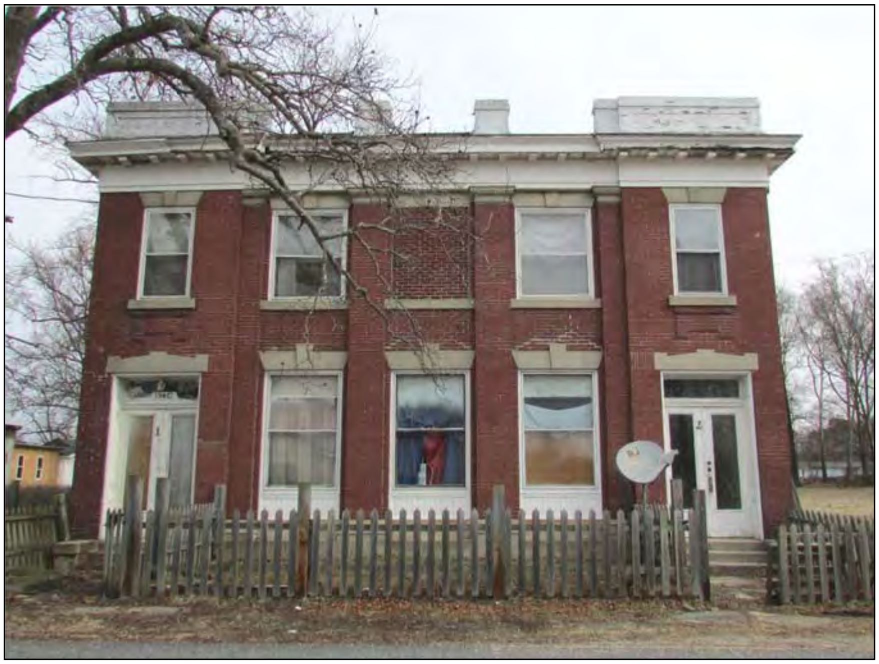

FIGURE 3-131: SOUTHWEST ELEVATION

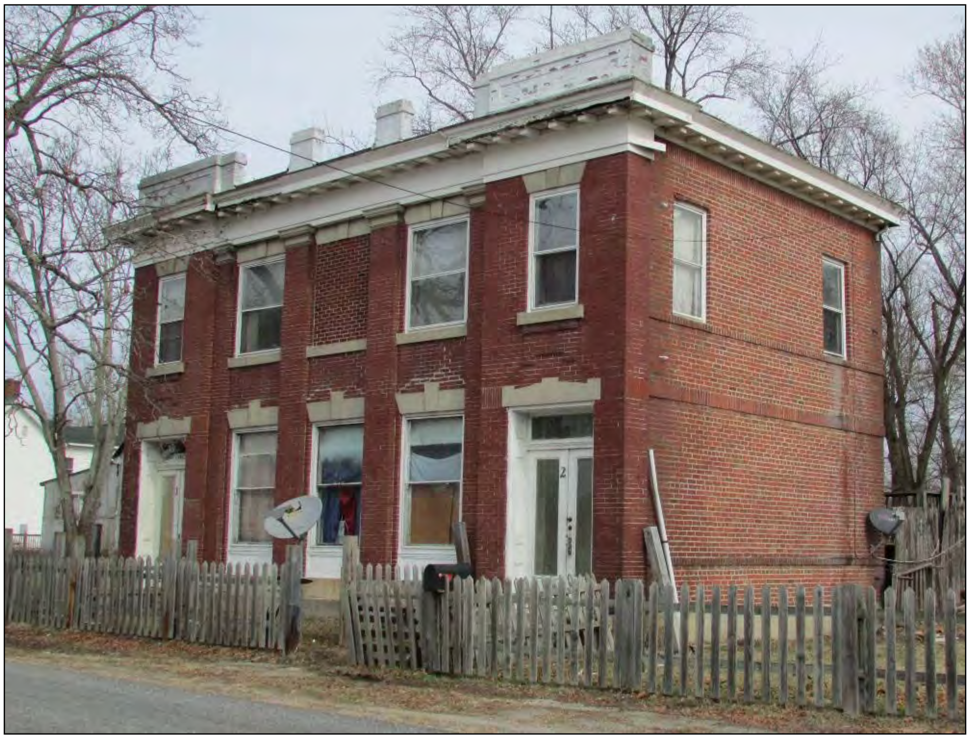

FIGURE 3-132: SOUTH OBLIQUE

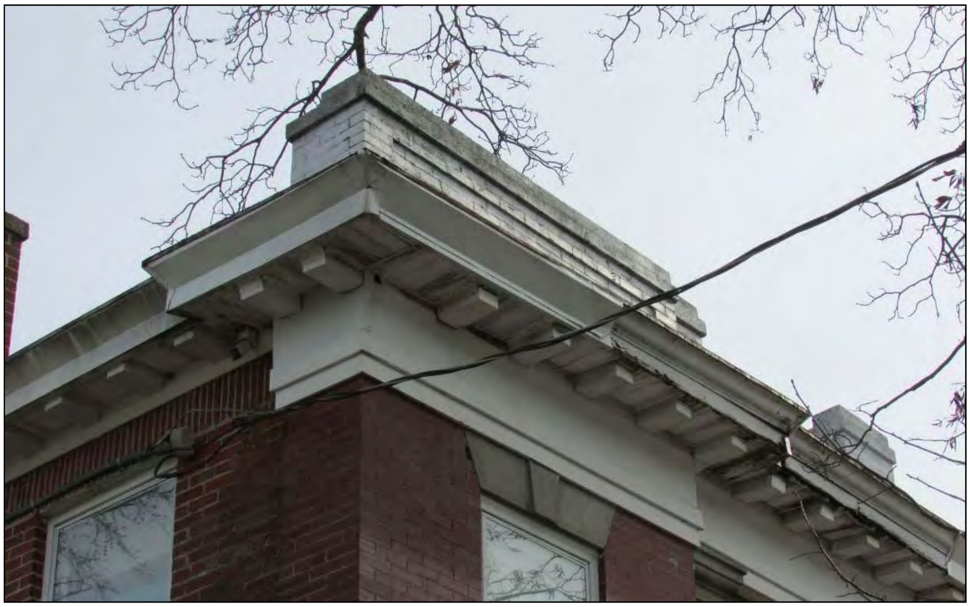

FIGURE 3-133: ROOF AND EAVE DETAIL, WEST OBLIQUE

A two-story addition, spanning a majority of the northeast elevation, is clad in vinyl siding and is covered by a low-pitched, hipped, standing-seam-metal roof (Figure 3-134). The north corner of the second story features a different shade of vinyl siding and the northwest portion protrudes slightly and is supported by a metal post. Though construction seams are obscured by the vinyl siding, the addition was possibly built in stages. A secondary entrance is situated on the northeast elevation of the addition and filled with a single-leaf, metal, paneled door. A set of concrete stairs is used to access the secondary entrance; the entrance is sheltered by a pent roof supported by wood brackets. Fenestration in the addition includes several one-over-one, vinyl, double-hung, and single-light, metal-frame, casement, replacement windows. A wood deck extends from the east half of the northeast elevation of the core of the building with a set of wood steps extending from the northeast.

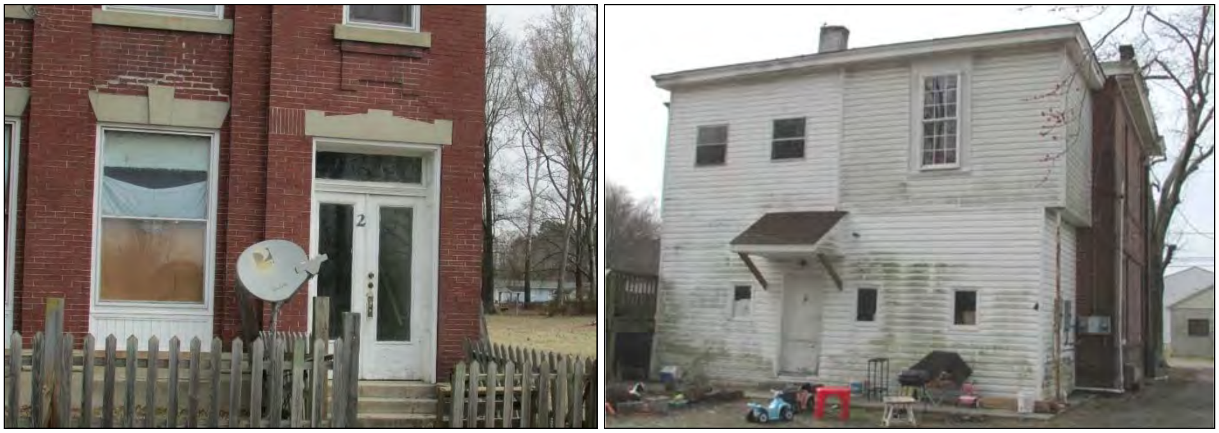

FIGURE 3-134: DETAIL OF FENESTRATION, SOUTHWEST ELEVATION (LEFT); NORTHEAST ADDITION OF THE MILFORD STATE BANK (RIGHT)

3.10.2.2 Primary Resource Interior

Interior access was not granted by the current property owner during this effort. However, the building is presently a multi-family dwelling divided into apartments, and the interior has likely been remodeled to accommodate this change in use.

3.10.3 NRHP Evaluation

The Milford State Bank is a two-story brick building constructed circa 1910 in the Classical Revival style. Milford State Bank was constructed during the fastest period of growth for the community of Milford at the turn of the twentieth century. Although once an integral part of economic development of Milford, this building has not been used as a bank for approximately 75 years. The resource retains historic integrity of location, setting, and some integrity of feeling and association; however, recent modifications including the introduction of replacement materials, change of use and probable division of interior space, alterations to original fenestration, and rear additions have significantly diminished its integrity of design, materials, and workmanship.

As the building no longer conveys its historic role as a bank in this community, it is recommended not eligible for listing in the NRHP under Criterion A. The Blatt Family played an important role in the growth of the Milford community; however, the bank was likely no longer used as a financial institution under their ownership. Further archival research did not yield any names of significant individuals involved with the bank's operation or other important people of note. Therefore, the resource is not eligible under Criterion B.

The Milford State Bank has undergone several alterations over the years, including the installation of vinyl replacement windows, construction of a rear addition, and major interior renovation to accommodate multi-family housing. Although it retains several notable elements, such as the divided façade with brick pilasters, denticulated cornice, brick parapet, and jack-arched window lintels, the resource maintains a low to moderate level of integrity of materials, design, workmanship, association, and feeling. While the Milford State Bank is one of only four banks in Caroline County to be recorded with the DHR, none of which have been formally evaluated for NRHP eligibility, there are several other examples of resources that retain the historic fabric of the exterior of the building but as they have had severe alterations to their interiors, DHR staff determined them to be not eligible for the NRHP. One example of this is the Seaboard Air Line Freight Depot (127-0292), an early-twentieth-century, two-story, masonry commercial building located in Richmond with similar ornamentation to the Milford State Bank. Although the building's exterior has been well maintained and only partially modified by the replacement of fenestration, the building's interior was heavily renovated into office spaces and other portions of the building were removed, greatly impacting the resource's overall historic integrity. As such, DHR staff determined that the Seaboard Air Line Freight Depot was not eligible in 2008. An additional example is the Bank of McKenney (257-5004) situated within the McKenney Historic District (257-5001) in Dinwiddie County. This resource, also within a railroad community, is a circa-1906, one-story, masonry bank building with detailed brickwork and an accentuated parapet along its façade. Similar to the Milford State Bank, the interior of the Bank of McKenney has also been substantially comprised leading DHR staff to determine the resource as not eligible under the category of architectural merit in 2012 (Dollins and Barile 2012). The Milford State Bank, similar to the above examples, does not sufficiently possess enough historic integrity to warrant eligibility for its architectural merit, it is recommended as not eligible for listing in the NRHP under Criterion C. As an architectural resource, it was not evaluated under Criterion D.

In sum, the Milford State Bank is **recommended not eligible under Criteria A–C.**

In addition, the Milford State Bank is located within the boundaries of the newly surveyed Milford Historic District (016-5136). The resource was built within the district's period of significance and exemplifies architectural trends throughout the community. As such, the Milford State Bank is recommended as a contributing element to the Milford Historic District.

3.11 COGHILL-JETER STORE (016-0286)

The Coghill-Jeter Store (016-0286), previously known as Coleman's Store and located at 22275 Penola Road, is a two-story, frame, commercial building constructed circa 1880. Despite being identified as "Coleman's Store" in earlier surveys, no evidence was found to suggest that the resource at 22275 Penola Road was built or even owned by a member of the Coleman family at any time in the past. The resource is located adjacent to the RF&P Railroad in the small, unincorporated community of Penola (Figure 3-135). The parcel also includes a two-story, three-bay dwelling at 16095 Polecat Lane, which allegedly served as the home of the storekeeper (See Figure 3-138).

3.11.1 Historic Context

When the RF&P Railroad opened its line through Caroline County in 1836, "Pole Cat" was one of only five stops along that route (Fall 1989:224). A post office was established at what was later known as Penola on June 29, 1857. Twenty years later the community claimed five merchants and tradesmen (Fall 1989:223–224). In 1886, Charles L. and Bettie L. Collins (nee Coghill) sold to Lewis L. Coghill a 90-acre tract straddling the railroad known as "Penola" (CCDB 61:177). This deed identified the study property as "the farm & store house at Penola Station," indicating that a store had been constructed on the land of Charles L. Collins sometime prior to 1886 (CCDB 61:178). According to the list of merchants in federal censuses, there is no record of Collins having operated a store at Penola nor does he appear as a merchant in the 1880 census (U.S. Census 1880). However, a merchant identified as Coghill & Brother are known to have been in business at Penola by 1880 (Fall 1989:224). In the census for that year, a bachelor named William G. Coghill was living with the family of his brother, Lewis L. Coghill, and both listed their occupation as merchants (U.S. Census 1880).

In 1885, Lewis Coghill was appointed postmaster at Penola, which he may have operated out of his store, and he continued as proprietor of the store until at least 1890 (Fall 1989:224–225; United States Post Office Department 1893). When Lewis Coghill passed sometime between 1890 and 1900, he was still in possession of the 90-acre tract of land at Penola Station. His young widow conveyed the tract containing the store to Thomas B. and William R. Jeter in 1903 (CCDB 70:256). In 1905, the Jeter brothers sold 1.78 acres adjacent to the southbound tracks of the RF&P Railroad to the railroad company.

By 1908, W.R. Jeter and T.B. Jeter dissolved their partnership and partitioned their assets with T.B. assuming ownership of the tract of land (CCDB 74:594). A 1917 plat shows the original core of the store without additions (Figure 3-136). T.B. Jeter continued to operate the store and farm the associated land, and his son, Henry Jeter, was employed as a store clerk by 1940 (Fall 1989:227; U.S. Census 1920, 1930, 1940; Wingfield 1924:291). When T.B. Jeter died in 1941, Henry continued to operate the store according to a 1949 newspaper article (The Bee 1950; CCDB 134:381; Fredericksburg Free Lance-Star 1949a, 1949b). As the popularity of the automobile increased, railroad passenger and freight traffic at Penola declined, as did the population and commercial enterprises that catered to them. By 1940, Penola and the nearby community of Peatross, located approximately 3 miles to the south, were listed with a combined population of just 25 people, and by 1969, neither the Penola post office nor the Penola depot were in service (Fall 1989:227).

Upon his death in 1960, the property passed to Henry's widow, Lucy F. Jeter, who conveyed a small parcel of 4.40 acres containing the store and the house to Gail & Kitty Gordon in 1964 (CCWB 41:389; CCDB 158:375). An aerial photograph taken two years later shows the store with at least two additions (Figure 3-137). This parcel is currently owned by their heirs, Lucas A. Gordon and Elizabeth B. Gordon, subject to the life estate of Kitty Gordon (CCDB 1197:796). The remainder of the property remains in the hands of the Jeter family and others.

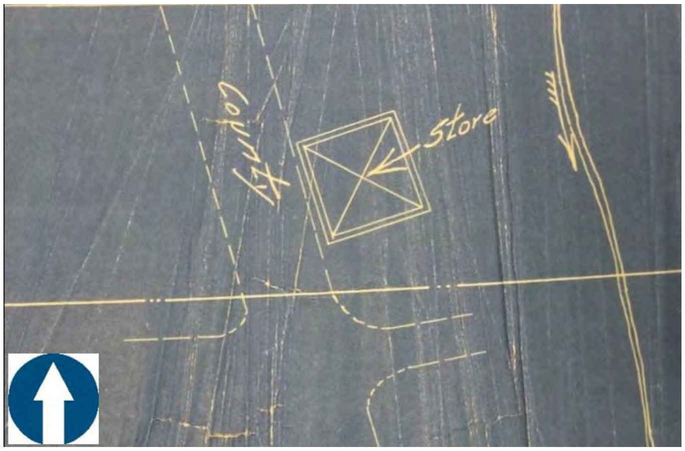

FIGURE 3-136: DETAIL OF 1917 PLAT MAP OF IMPROVEMENTS TO THE STATION AT PENOLA, SHOWING FOOTPRINT OF THE COGHILL-JETER STORE (RF&P RAILROAD COMPANY 1917) (MAP NOT TO SCALE)

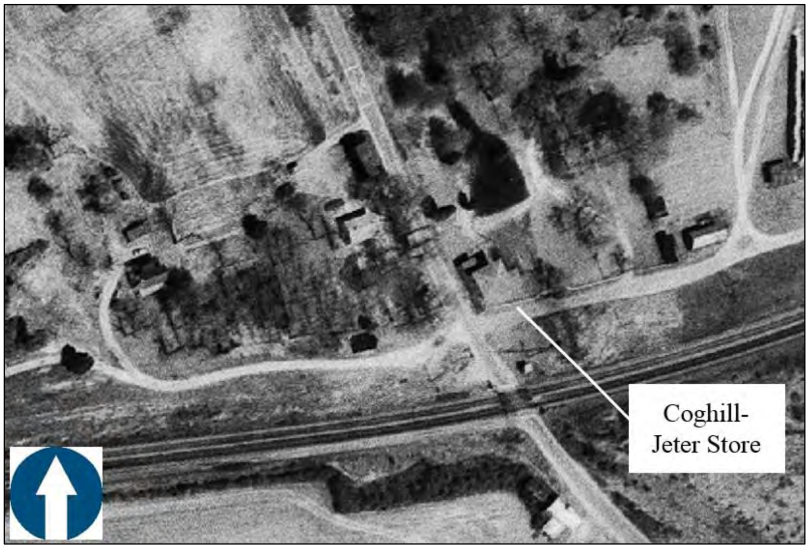

FIGURE 3-137: 1966 AERIAL VIEW OF PENOLA AND THE COGHILL-JETER STORE (USDA 1966B)

According to historic topographic maps, an associated house, possibly used as the store owners' residence, existed at the location now identified as 16095 Polecat Lane by 1918 (USGS 1918). In 1911, the value of the buildings on the parcel increased from $300 to $1,500, perhaps indicating the construction of this house. Furthermore, the materials of the dwelling, particularly the concrete-block foundation, suggest a construction date of circa 1911.

3.11.2 Architectural Description

3.11.2.1 Primary Resource Exterior

The primary resource, the Coghill-Jeter Store, is a two-story building consisting of a square central block and three smaller one-story wings (Figures 3-138 and 3-139). The 1917 plat shows a simple square building with pyramidal roof devoid of wings or additions, suggesting that all three projecting wings were later additions (Figure 3-139) (RF&P Railroad Company 1917). The central block, which is the original core, has a continuous brick foundation with periodic parging that supports a frame structure clad in weatherboard (Figure 3-140). The pyramidal roof is covered with standing-seam metal and a vent pierces the roof on the southwest slope. A rectangular metal cap is located on the peak of the roof, suggesting that a chimney stack may have been removed at some time. The primary entrance is centered on the southwest-facing façade and consists of double-leaf wood doors of vertical boards with a double-leaf, wood-framed screen door topped by a two-light transom with security bars and a commercial-style gooseneck light fixture. A set of poured-concrete steps provide access to the main entrance. A secondary entrance is located on the southeast elevation facing the railroad tracks and consists of double-leaf, paneled wood door with porcelain knob topped by a two-light transom with security bars. The steps accessing this entrance have been removed. Windows consists primarily of six-over-six, double-hung, wood sashes in the upper story and paired, two-over-two, double-hung, wood sashes with vertical muntins and operable wood shutters of diagonal boards in the lower story of the façade.

Three one-story frame additions, added after 1917, extend from the central core of the building: one from the northwest corner, one from the northeast elevation, and one at the south corner. All three are clad in weatherboard and covered by hipped roofs sheathed in standing-seam metal. The additions are raised on brick and poured concrete piers. An entrance is located on the southeast elevation of the northeast addition and the southwest elevation of the south addition. They are both filled with a single-leaf wood door of vertical boards (Figures 3-140 and 3-141). Other fenestration consists of two-over-two, double-hung, wood sashes with vertical muntins protected by modern metal security mesh (Figure 3-141).

3.11.2.2 Primary Resource Interior

The first story of the Coghill-Jeter Store has a one-room open core, with interior doors leading to all three additions to the north, east, and west of the primary entrance (Figures 3-142 and 3-143). A fixed icebox grocery counter is located in the center of the room (Figure 3-144). The ceiling and interior walls are clad in shiplap siding. Piping for a stove or other exhaust outlet extends from the center of the room to the second floor via a central ceiling vent. Two of the first story additions have the same treatment as the core room: ceiling and interior walls clad in horizontal beveled wood siding, and the third has plaster coated walls and ceiling. The Coghill-Jeter Store also has several operating F. E. Meyer & Brothers ladders with shelf-tracks on the north, west, and south ends of the primary room. Established in 1870, the Meyer Company produced pulleys and hardware out of Ashland, Ohio.

The second story, accessed via a wood winder staircase lined with a two-by-four railing on the north side of the center core, has a single room with an open plan and an additional room in the south corner (Figure 3-145). The wall on the south side of the second story is unclad, exposing the lath and plaster keys of the secondary room. The wood trim, ceiling and wall paneling, and floors appear to be original to the core of the building. The building is currently used as an antique store, and both floors are used for inventory and storage.

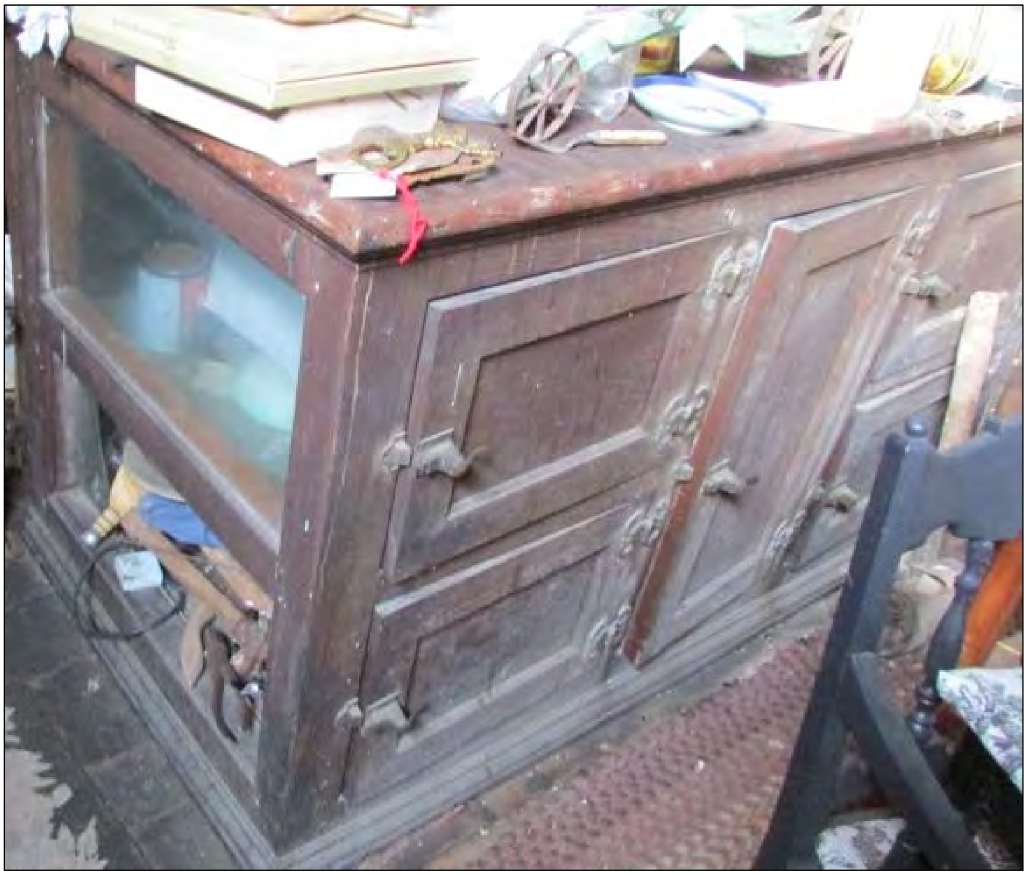

FIGURE 3-144: CENTRAL COUNTER, DETAIL IN FIRST STORY, LOOKING NORTHWEST

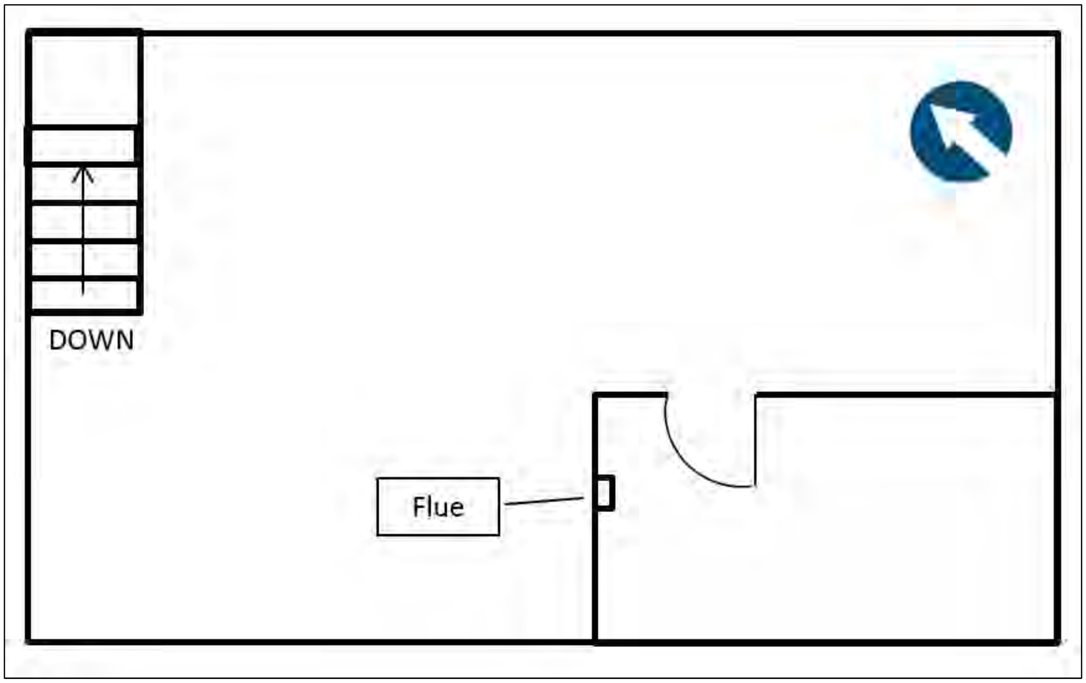

FIGURE 3-145: SECOND STORY PLAN (NOT TO SCALE)

3.11.2.3 Secondary Resources

The single-family dwelling at 16095 Polecat Lane is located northeast of the Coghill-Jeter Store on the same parcel. According to historic topographic maps, tax assessment records, and field inspection, the house is believed to have been constructed circa 1911. The two-and-a-half-story building with partially excavated lower story is three bays wide, two bays deep, and has an overall square plan (**Error! Reference source not found.**-146). A one-story addition on the northeast elevation was constructed sometime after 1966 and was enlarged in 2015. The building has a raised, continuous, concrete-block foundation that supports a frame structural system clad in vinyl siding. The hipped roof is covered with standing-seam metal and displays interior brick chimneys near the southwest and northwest corners and an interior chimney of concrete block on the northeast slope. The primary entrance is located on the southeast elevation and consists of a single-leaf, paneled, wood door with modern storm door flanked by two-light sidelights and topped by a three-light transom. The entrance is accessed via a raised porch with a wood deck resting on poured-concrete piers. Chamfered wood columns with flat decorative capitals support a hipped roof. The balustrade consists of flat panels with decorative geometric cutouts, and the porch is accessed via a set of five wood steps with wood railing. A secondary entrance is located in a small, one-story, ground-level projection at the northwest corner and appears to provide access to a basement or cellar. A raised, one-story, frame screened-in porch on the rear (northwest) elevation has post-in-ground construction and a shed roof (Figure 3-147).

Other fenestration consists primarily of six-over-six, double-hung, vinyl replacement windows flanked by fixed shutters. A one-and-a-half-story, post-1966 addition at the northeast corner of the dwelling features a raised concrete-block foundation, frame structural system clad in vinyl siding, and a side-gabled roof. An exterior brick chimney with two sets of shoulders is located on the northwest elevation of the addition. On the northeast elevation, a set of concrete steps leads down to a subterranean entrance that accesses the basement. In 2015, construction was underway to expand the addition with a raised, post-in-ground extension on the southeast elevation and a new gabled roof (Figure 3-148).

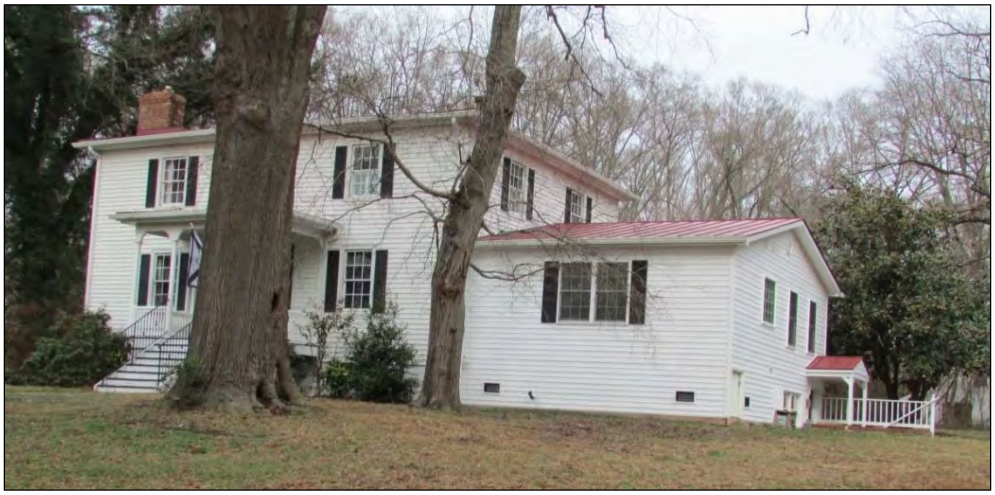

FIGURE 3-146: DWELLING AT 16095 POLECAT LANE, SOUTHEAST OBLIQUE

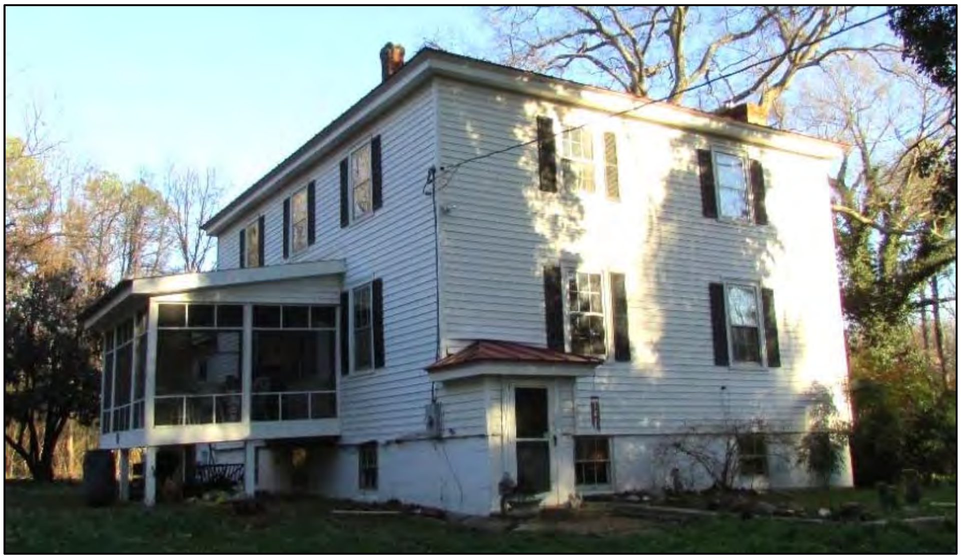

FIGURE 3-147: DWELLING AT 16095 POLECAT LANE, NORTHWEST OBLIQUE

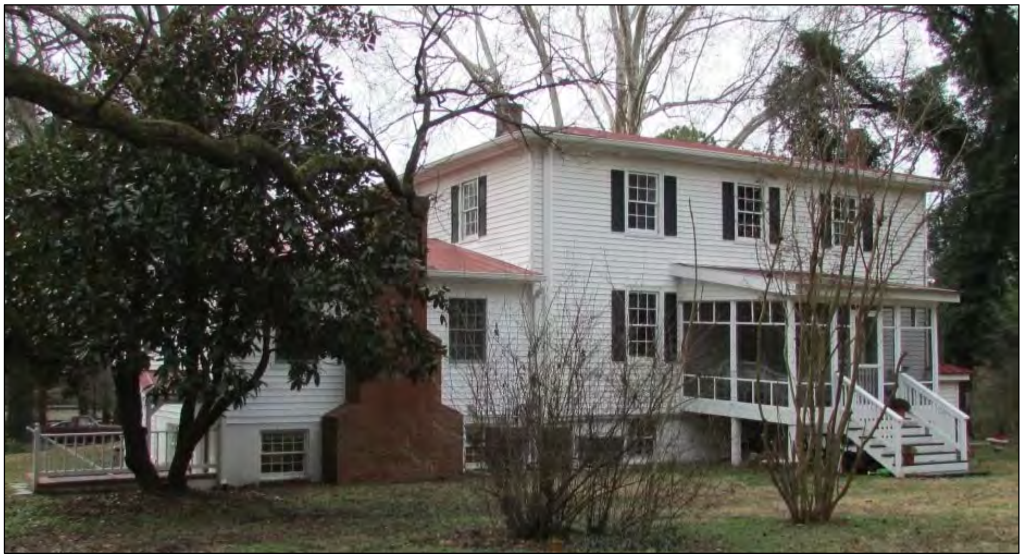

FIGURE 3-148: DWELLING AT 16095 POLECAT LANE, NORTHEAST ELEVATION

A small, rectangular, frame barn with a side-gabled roof is located in the southeast corner of the property, immediately adjacent to Polecat Lane and approximately 125 feet from the railroad tracks (Figure 3-149). According to historic aerial imagery, the barn predates 1966 and is estimated to have been constructed around the same time as the house circa 1911. An entrance on the north elevation provides access to the interior and does not have a door. Two small sheds are located on the north side of the property (Figure 3-150). One of the sheds, constructed around 1911, is a square frame building clad in board-and-batten siding located northwest of the dwelling. The building features a single-leaf door of vertical boards centered on the south elevation. The second small frame shed clad in T1-11 siding is located northeast of the house and is estimated to have been constructed circa 1925. The shed roof is covered with v-crimp metal. Fenestration includes a single-leaf, wood door and six-light, wood-framed windows.

3.11.3 NRHP Evaluation

The Coghill-Jeter Store is the only surviving commercial building in the largely abandoned village of Penola and is representative of the small country stores once found in crossroads communities and railroad stops throughout rural Caroline County. Although the store appears to have undergone alterations in the early-twentieth century, such as the construction of at least two one-story additions and window replacement, overall, the resource retains a moderate to high level of historic integrity of design, materials, and workmanship. It has a high level of integrity of location, setting, feeling, and association, as the area surrounding resource has remained fairly unaltered and rural.

The NPS outlines the considerations for which a property can be eligible for the NRHP under Criterion A. They are as follows: "To be considered for listing under Criterion A, a property must be associated with one or more events important in the defined historic context… The event or trends, however, must clearly be important within the associated context … and it must retain historic integrity" (McLelland et al. 1999). The Coghill-Jeter Store no longer functions as a general store for the small community of Penola, nor is it known to be directly associated with an important event in history. For these reasons, the Coghill-Jeter Store is recommended not eligible for the NRHP under Criterion A.

For a resource to be eligible under Criterion B, it must have an association with a person who is "individually significant within a historic context" and has "gained importance within his or her profession or group" (Shrimpton et al. 1990). None of the owners were found to be particularly impactful on local commerce nor were they found to be generally important locally, statewide, or nationally; therefore, the resource is recommended not eligible for the NRHP under Criterion B.

Although there are other surviving examples of general stores in railroad-focused communities within the county, not many retain their historic fabric as does the Coghill-Jeter Store. The Clarke's Store (016-0271) in the Milford Historic District (016-5136) along the railroad in Caroline County is a two-story, front-gabled, frame store (see photo on page 3-114). It is currently suffering from vacancy and neglect and features many replacement exterior materials. Also located within the Milford Historic District is Blatt's Store (016-0272), which is a circa-1890, two-story frame commercial building converted into a dwelling. It is clad in replacement materials and features many large-scale additions (see photo on page 3-113). The E.C. Allen Store (016-0211) is another example of a late-nineteenth-century, frame store building; however, unlike the Coghill-Jeter Store, it has been covered in replacement materials and fenestration and has also been converted into a dwelling. Similar to the Coghill-Jeter Store, the Darnell Store (042-0470) located on the north side of Doswell Road, east of the railroad tracks in neighboring Hanover County, is a two-story, frame commercial building with flanking wings; however, it features a large two-story, façade addition (see page 3-151 for further discussion). Unlike the Coghill-Jeter Store, there are many notable extant examples of this property type throughout Hanover County (i.e. Cobb Store [042-0341] and Stanly Store [042-0352]) whereas Caroline County is lacking in this regard. As one of the most architecturally intact examples of a rural, late-nineteenth-century, general store building along the RF&P Railroad in Caroline County, this resource is recommended eligible for the NRHP under Criterion C. As an architectural resource, this property was not evaluated under Criterion D.

In sum, the Coghill-Jeter Store is **recommended eligible for the NRHP under Criterion C.**

The proposed NRHP boundary for the Coghill-Jeter Store at 22275 Penola Road comprises and follows the legal lot description for parcel 85-A-61 in Caroline County (Figure 3-151). It is bounded on the west by Penola Road, on the south by Polecat Lane, on the east by parcel 85-A-60, and on the north by parcel 71-A-17A. The proposed boundaries include the store, the house, barn, and two sheds. The period of significance for the Coghill-Jeter Store begins with its ownership by the Jeter Family around 1880 and ends in 1964, when it ceased use as a country store.

3.12 DOSWELL HISTORIC DISTRICT (042-5448)

The Doswell Historic District (042-5448), an unincorporated community in Hanover County, is located along the Virginia Central Railroad, later part of the Chesapeake and Ohio (C&O) Railroad, at the crossing of the RF&P Railroad, both of which are now owned by CSXT (Figure 3-152). Doswell Road, which runs east-west, cuts through the middle of the hamlet where the railroad tracks intersect. Two additional roads are situated within the boundaries of the historic district: Railroad Avenue and Doswell Park Road.

Historically, the area was surrounded by rural farmsteads; however, at the turn of the twentieth century, a small community was more formally established around the crossroads of the railroads where a train depot welcomed freight and passengers. Commercial and residential buildings were constructed primarily on the east side of the tracks while a warehouse was situated to the north and a farm to the west. Now, the district is mainly occupied by residential buildings and retains much of the architecture from that prosperous period. In 1994, DHR staff formally determined the Doswell Historic District eligible for the NRHP under Criterion A at the local level for its significance in transportation; however, a 2008 survey and the initial survey of the DC2RVA Project recommended it potentially eligible under Criteria B and C as well (Peckler 2016).

3.12.1 Historic Context

After the RF&P Railroad opened their north-south route in 1836, the Louisa Railroad Company constructed the Virginia Central Railroad in 1850 from Richmond westward to Stanton where it intersected with the RF&P Railroad north of Richmond in Hanover County (Hanover County Historical Society 1993). The community of Doswell, originally known as Louisa Depot and then Hanover Junction, was established at this intersection (Neville et al. 1992). Most buildings constructed during that time have since been demolished due to events of the Battle of North Anna River during the Civil War (Salmon 2001). The Virginia Central Railroad played a significant role for the Confederate Army during the war as General Robert E. Lee relied on these railroads for supplies during his famous campaigns between 1862 and 1864, therefore this area of Central Virginia was a point of contention (Figures 3-153 and 3-154) (Salmon 2001). The area also had its share of fighting primarily during the Virginia campaigns, with the Union Army attempting to cut off supplies to the Confederates (Staunton Spectator 1863).

FIGURE 3-154: PLAN OF THE BATTLE OF NORTH ANNA RIVER FOUGHT MAY 23RD–MAY 26TH, 1864 (SNEDEN 1865)

As shown in Figure 3-155, the Doswell farm, also known as Bluffield, was located just northwest of Hanover Junction. The Doswell family has lived in this area of central Virginia since the American Revolution. Major Thomas Doswell (1823–1890) inherited the family farm from his father. Thomas Doswell is known for serving as a staff officer for the Confederate Army during the Civil War and for his love for horse racing. It is for him the name of the hamlet of Hanover Junction was changed to Doswell after his death in 1890 (Hanover County Historical Society 1993).

The community of Doswell was already roughly laid out in 1874 when a farm in the area known as the "Junction property" was divided between six estates. Shortly prior to the death of Thomas Doswell, a significant amount of land formerly belonging to a deceased Phillip B. Winston immediately surrounding the intersection of the railroads was subdivided into 19 lots amongst his heirs (Hanover County Deed Book [HaCDB] 7:388–390). The little town began to flourish at that point (Figure 3-155). An excelsior mill was established near the intersection of the railroads, the Old Dominion Excelsior Mill Co., as well as a general store and bank to the east of the railroad intersection.

A majority, if not all, of the commercial and industrial development of Doswell occurring in the 1890s and first two decades of the 1900s was due to merchant and entrepreneur Daniel E. Campbell (1867–1939) (Virginia Department of Health 1939). Daniel Campbell, who purchased many of the subdivided lots of the Winston estate, owned and operated the general store (042-0470) and hotel in Doswell, establishing the Doswell branch of the Tri-County Bank (042-0469), and operating a nearby excelsior mill (Hanover County Historical Society 1993). His life and accomplishments are discussed further in the Darnell Store (042-0470) section of this report (page 3-149). He is also attributed with constructing several of the residential dwellings within the district as well.

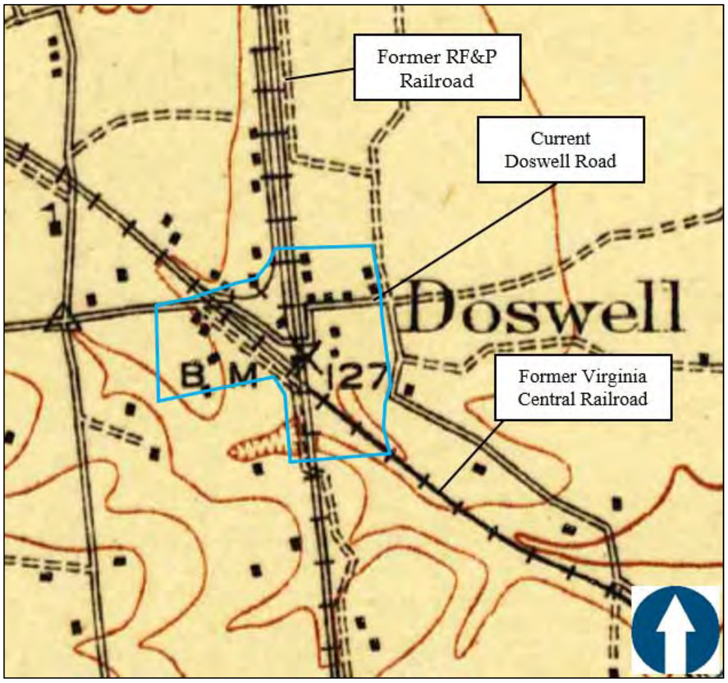

FIGURE 3-155: DOSWELL HISTORIC DISTRICT (IN BLUE) ON 1918 USGS 15-MINUTE TOPOGRAPHIC MAP OF DOSWELL, VIRGINIA (USGS 1918) (MAP NOT TO SCALE)

While the railroad community was in its prime, farming, industry, and trade combined to keep the local community prosperous (Hanover County Historical Society 1993). Development around the central hub of Doswell also continued through the 1930s due to the continuation of passenger and freight traffic throughout the area (McCartney 2009). The original passenger depot (043-0093) burned down and was reconstructed in its current Colonial Revival-style around 1928 while a switch tower for the operation of the crisscrossing railroad tracks was built in 1929 (Figure 3-156). Discussed in the Doswell Depot and Tower (042-5466) section of this report, the passenger stop was retired primarily in 1958; however, they allowed passenger trains to stop at the depot in Doswell on a case by case basis until 1970 (see page 3-177). The construction of U.S. Route 1, portions of which are the historic Jefferson Davis Highway which came through during the 1910s, slightly affected railroad transportation. It was not until Interstate 95 was constructed in the late 1950s, though, that Doswell began to dwindle. The introduction of this highway became a deterrent for passenger rail travel at this time; subsequently the Doswell stop was eventually abolished. However, this may have saved the small hamlet from further modern development and sprawl. Currently, buildings on the eastern side of the railroad intersection in Doswell are primarily residential save for the former bank and general store which are now occupied by an antique operation while the area to the western side of the tracks is primarily industrial and continues to be utilized by CSXT.

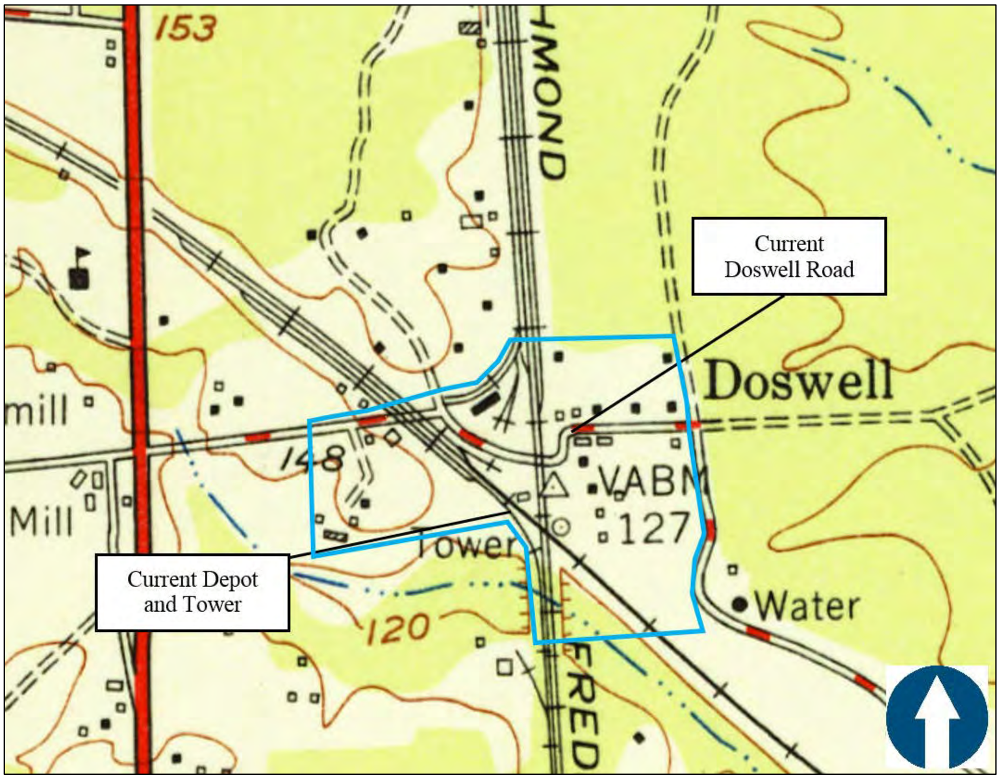

FIGURE 3-156: DOSWELL HISTORIC DISTRICT (IN BLUE) ON A 1951 USGS 7.5-MINUTE TOPOGRAPHIC QUADRANGLE MAP OF DOSWELL, VIRGINIA (USGS 1951) (MAP NOT TO SCALE)

3.12.2 Architectural Description

The village of Doswell is a small rural community that experienced substantial growth during the late-nineteenth and early-twentieth centuries as a result of the development and expansion of the railroad. The buildings within the district were constructed between 1850 and 1940 and include three rail-related structures, two commercial buildings, a church, and nine residential buildings (Figure 3-157). The district contains only one road, Doswell Road, which leads from U.S. Route 1 in the west and continues east over the former RF&P Railroad tracks towards I-95. Buildings are primarily situated on the east side of the tracks with an agricultural property and mixed industrial and residential property on the west. The road is not lined with a public sidewalk, and the properties within the district are spotted with a mix of deciduous and coniferous trees, shrubbery, and plantings (Figure 3-158).

Although Doswell served as a passenger and freight stop until the late 1950s, the small railroad village has remained fairly intact with a majority of its above-ground resources dating from the turn of the century. The circa-1927 Doswell Depot and Tower (042-0093) sit at the track intersection at the center of the village, where it replaced an older wooden depot in that area that had burned (see page 3-179 for further discussion on this resource). Daniel Campbell, the force behind successful settlement and growth of the village, constructed several buildings on the east of the track intersection including the Darnell Store (042-0470), Doswell Inn (042-0468), and the Daniel Campbell House (042-0467), among others.

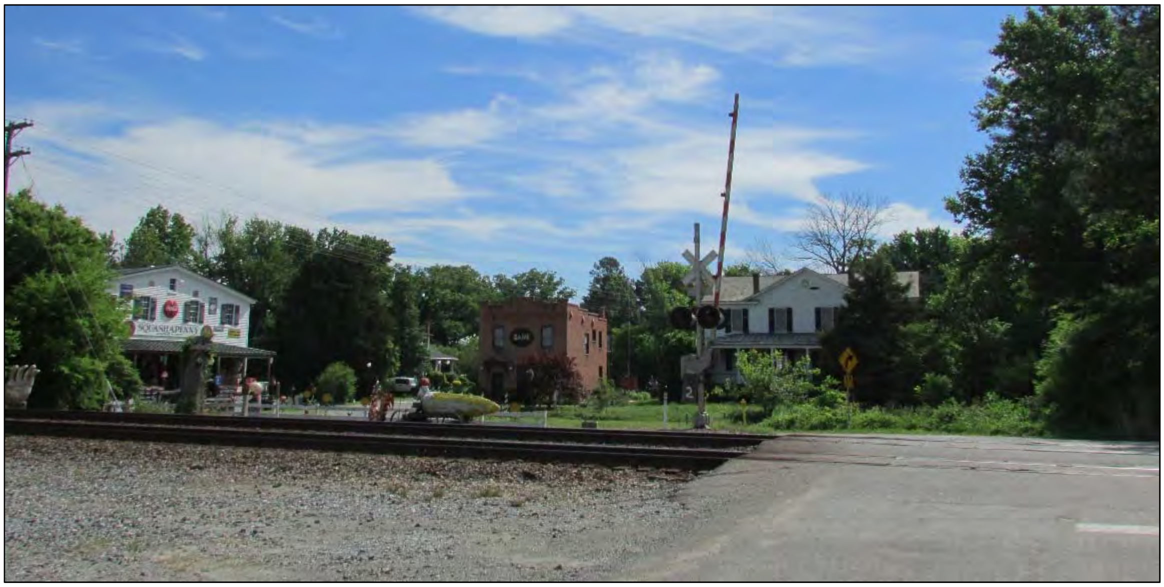

FIGURE 3-157: VIEW OF INTERSECTION OF RAILROAD TRACKS AND DOSWELL ROAD, LOOKING EAST

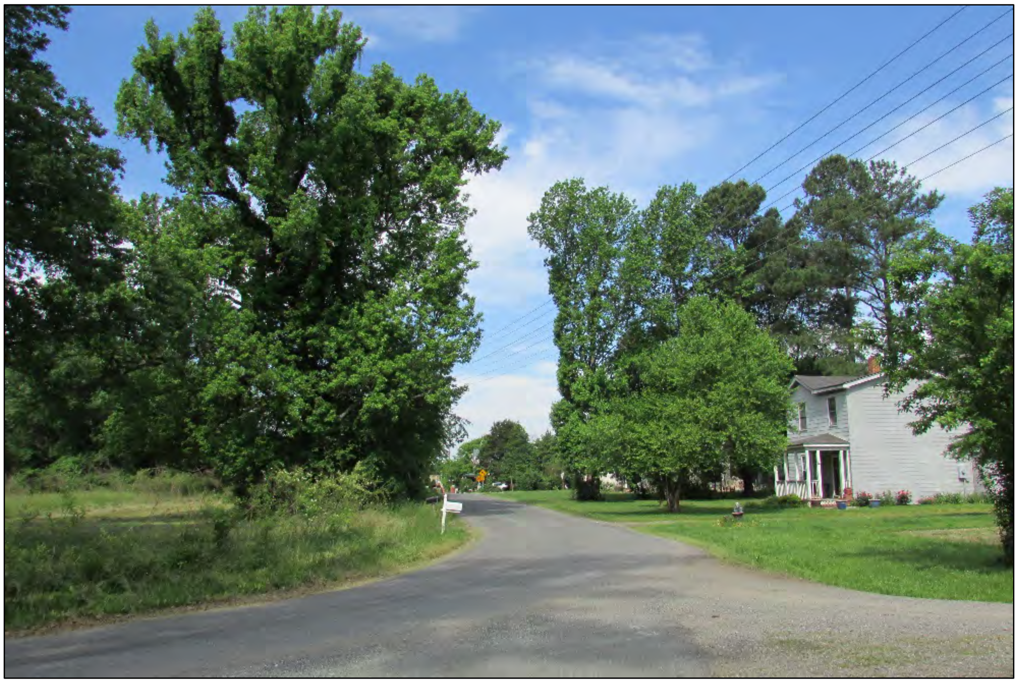

FIGURE 3-158: VIEW OF DOSWELL ROAD FROM 10540 DOSWELL ROAD (043-0473), LOOKING WEST

The architectural styles of the residential buildings included within the district boundaries reflect trends seen through this region of Virginia during the turn of the twentieth century, except for the Billy Wright House (042-0477) which was constructed circa 1850. A majority of the residential resources constructed between 1890 and 1900 reflect a vernacular form and are mainly two stories in height and have an L-shape or I-house plan. These include the Flippo House (042-0474), Daniel Campbell House at 10548 Doswell Road (042-0472), Daniel Campbell House at 10540 Doswell Road (042-0473), and Daniel Campbell House at 10564 Doswell Road (042-0475) (Figures 3-159 and 3-160). Following the Eclectic movement that was popularized during this time, other architectural styles or characteristics thereof seen through the village include Georgian Revival and Free Classic (Doswell Inn, 042-0468, and Daniel Campbell House at 10571 Doswell Road, 042-0467) (Figure 3-161) (McAlester 2015). Outliers of the group of residential buildings in the Doswell Historic District is the House at 10558 Doswell Road (042-0471), which was constructed in circa 1927 as a Craftsman-style bungalow, and the House and Warehouses at 10600 Doswell Road (042-5719), which was constructed in circa 1925 in a one-story vernacular form (Figure 3-159).

The commercial buildings located within the district were constructed between 1898 and 1930. The Darnell Store (042-0470), discussed further in a separate section of this report (p. 3-149), is the earliest commercial building within the district being constructed with a frame structural system around 1898 in a vernacular form. The Tri-County Bank–Doswell Branch (042-0469), detailed on page 3-158, was constructed circa 1920 in a vernacular commercial building style. One mixed-use building, Allen’s Store and House (042-0476), is known to have been demolished. The church is situated in the eastern half of the district on Doswell Road and consists of a one-story, frame structure constructed during the 1960s. A circa 1940, single-span, arched concrete culvert (500-0001-0012) is situated just south of the depot. A rail-related resource, the Doswell Depot and Tower (042-5466), was constructed circa 1928 to replace an older depot station that had burned down. It features architectural characteristics of the Classical Revival style (see page 3-180).

In general, buildings in the district range from one to two stories in height and primarily are built upon continuous foundations. Exterior materials include weatherboard siding and brick laid in an irregular or common bond. They are primarily covered in a type of gable and feature replacement material such as asphalt except for one building (042-0469) that is covered by a shed roof. Chimneys are typical made of brick and situated within the interior end of a building; however, some concrete-block chimney additions have been noted. Although some fenestration has been replaced, as is common in continuously occupied buildings, many still retain original or in-kind windows and doors. These includes two-over-two, wood-frame, double-hung sashes as well as six-over-six, double-hung sashes. Primary elevations typically feature an entry stoop or porch except for the Daniel Campbell House (042-0467) which has a wrap-around porch. Secondary resources include such structures as storage and machine sheds and wells.

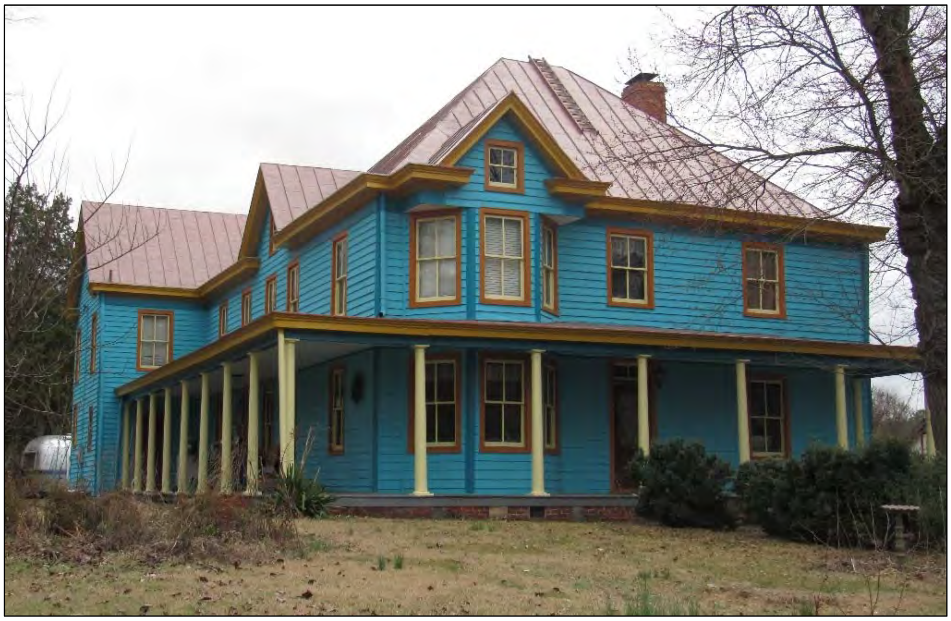

FIGURE 3-161: NORTHWEST OBLIQUE OF 10571 DOSWELL ROAD (042-0467)

3.12.3 NRHP Evaluation

The village of Doswell is a representative example of a small rural community that experienced substantial growth during the late-nineteenth and early-twentieth centuries as a result of the development and expansion of the railroad. The buildings within the district were constructed between 1850 and 1940. Doswell has largely avoided modern development and still retains its rural character and railroad-inspired plan as well as a range of contributing resources that reflect the small communities that once dotted the rural landscape in the late-nineteenth and early-twentieth centuries and therefore possesses a high level of integrity of location, setting, feeling, and association. The retention of historic materials and general good condition of the individual resources within the district renders a moderate to high level of integrity of materials, workmanship, and design.

Although located within the North Anna River Battlefield (042-0123), better representative areas as well as intact tangible evidence of the Civil War's impact exist within other areas of Hanover County, particularly northwest (Salmon 2001:288). According to John S. Salmon in *The Official Virginia Civil War Battlefield Guide*, "much of the North Anna River battlefield remains in farmland, but development is an ever-present threat. The Confederate earthworks at Ox Ford, some of the most impressive remaining anywhere" are located within land donate to Hanover County by a quarry company and are located outside the Doswell Historic District boundaries (2001:288). While fortifications were known to have been established along the east side of the railroad intersection within the hamlet of Doswell, building construction during the turn of the century would have disturbed these works and other demonstrative examples are found throughout the county. Although the hamlet was already established around this railroad junction, the effects of the Civil War were prolific in this area, and remnants of the old Hanover Junction are now barely visible.

While many railroad crossing communities are now gone or have compromised integrity, such as the Woodford Historic District (016-5129) (described further on page 3-41), Doswell remains mostly intact. Although the village was never incorporated, it is "an excellent representation of a transportation crossroads that grew during the railroad heyday of the early-twentieth century and was subsequently bypassed when highway travel took over rail as the primary transportation method in the 1960" (Barile 2008). Therefore, the resource is recommended as eligible for the NRHP under Criterion A for its connection to notable transportation planning and development at the local level.

For a resource to be eligible under Criterion B, it must have an association with a person who is "individually significant within a historic context" and has "gained importance within his or her profession or group" (Shrimpton et al. 1990). Furthermore, they "must be shown to have played a distinctively significant role in comparison with other to qualify" a resource as eligible under this criterion (Bolland n.d.). Although present-day Doswell was heavily developed by Daniel Campbell, a local businessman who was known to have been responsible for much of the industrial and commercial enterprises within the community around the turn of the twentieth century, it was not uncommon for an RF&P Railroad town within the Hanover County or surrounding counties to experience a short period of growth due to industry introduced by a savvy entrepreneur to an underutilized railroad stop. Daniel Campbell is not known to be particularly important or unique in the excelsior industry or in his general commercial dealings. An example of this similar occurrence is George P. Lyon and the Woodford Historic District (016-5129), which is further discussed on page 3-43 of this report. Additionally, the village never progressed to incorporation and development was stunted by the mid-twentieth century. For these reasons, the Doswell Historic District is recommended as not eligible under Criterion B.

According to the guidelines set by the NPS, for a district to be eligible under Criterion C, it must clearly contain enough distinctive characteristics to be considered a true representative of a particular type, period, or method of construction (Shrimpton et al. 1990). The district is filled with residential, commercial, and railroad-related buildings that reflect locally popular architectural styles during its period of significance including Craftsman, Georgian Revival, and vernacular forms of the I-house and L-plan. As a whole, the contributing resources have seen very little alteration during the latter half of the twentieth century, and the district has been steadily brought back to life during the twenty-first century by incoming younger homeowners willing to restore rather than demolish. Despite the loss of one historic building, the remaining buildings within the district retain a high level of overall historic integrity and continue to reflect the architectural trends of the period in which they were constructed, unlike many other rural railroad communities in Central Virginia. For these reasons, the district is recommended eligible for the NRHP under Criterion C at the local level for its representation of a turn-of-the-century, railroad community. The Doswell Historic District was not evaluated under Criterion D.

In sum, the Doswell Historic District is **recommended eligible for listing in the NRHP under Criteria A and C at the local level.**

The proposed NRHP boundaries for the district begins at the east side of Doswell Road and continues south along the road approximately 0.15 miles, where it turns west and crosses over the railroad tracks and continues along the boundaries of Parcel ID 7883-28-9018 back north toward Doswell Road. It then continues east toward the intersection railroad tracks and crosses over to the southwest corner of Parcel ID 7883-38-7663. Then the boundary turns north to follow the west side of Parcel ID 7883-38-7663 and 7883-38-8806, then turns east and continues along the north side of Parcel ID 7883-38-8806 and 7883-48-1857 back to the beginning, and encompasses approximately 67.09 acres (Figure 3-162). The recommended period of significance spans from 1880 to 1940, containing the primary construction period of the hamlet.

3.13 DARNELL STORE (042-0470)

The Darnell Store, currently called Squashapenny Junction, is located on the north side of Doswell Road, east of the railroad tracks within the heart of the Doswell Historic District (042-5448) in Hanover County (Figure 3-163). The commercial building, presently operating as an antique shop, is situated close to the roadway on a squared lot measuring approximately 0.6 acres, primarily filled with a manicured grass lawn. The west and north boundaries of the property are lined with deciduous trees, and a gravel parking area is situated south of the building. A dirt and gravel driveway extends from this parking area on the east side of the store towards the rear (north). The property is accessed by a gravel drive extending from the road on the northwest side of the building, leading to a parking area to the northeast of the dwelling. Secondary resources associated with the commercial building include a well, battery house, and frame outbuilding.

3.13.1 Historic Context

The Darnell Store is the only remaining commercial building in the small, unincorporated community of Doswell. For a larger history of the community of Dowell, see the section for the Doswell Historic District (page 3-137).

As previously mentioned, the community of Doswell was roughly laid out in 1874 when a farm in the area known as the "Junction property" was divided into six estates. The estate of Philip B. Winston was allotted lots 2, 7, and 17, which totaled 21.25 acres and was valued at $825 (HaCDB 7:388). The store would later sit on Lot 7 (Figure 3-164). Philip B. Winston was from a prominent family in Hanover County and served as an aid-de-camp to Confederate General Thomas L. Rosser during the Civil War (Atwater 1893:800–802). In 1874, he moved to Minneapolis, Minnesota, and started a railroad contracting company, and in 1888 became the Mayor of Minneapolis (Atwater 1893: 800–802). Since he had moved to Minneapolis by the time he received the allotments of land from the Junction property, it is likely that they were intended as investment properties.

In 1883, B.L. Winston, working as the executor of the Philip B. Winston estate, sold "all of lot no: 7" consisting of 6.5 acres for $110 to Isaac Hugh Thompson. Isaac bought the property when he was 18 (HaCDB 42:113; US Census 1880). He married Fannie Maude Beazley of Caroline County in 1898, and they are listed as living in Richmond in 1900 where Isaac was working as a railroad conductor (US Census 1900, 1910). Isaac and Maude sold the property to Daniel E. Campbell in 1903 for $500, though the store is noted as already having been being built in 1898 by Daniel Campbell (HaCDB 42:113). It is likely that Campbell leased the land from the Thompson's and constructed the store prior to his purchase in 1903.

FIGURE 3-164: DETAIL FROM THE PLAT OF THE DIVISION OF THE FARM KNOWN AS THE JUNCTION PROPERTY FROM 1874 (HACDB 7:390). NOTE LOT 7 OUTLINED IN RED. (MAP NOT TO SCALE)

The general store Daniel Campbell built, now known as Darnell's Store, is a two-story, three-bay commercial building with flanking wings that is located directly east of the RF&P Railroad and 500 feet north of the crossroads with the C&O Railroad. It follows period architectural trends in form, massing, and location to other general stores throughout Hanover County. Typical late-nineteenth and early-twentieth century stores in this area were either one or two stories, built with a rectangular plan and a three-bay façade that featured a central door flanked by two windows (Land and Community Associates 1992:84). They were often located in crossroads communities near the railroad which allowed for easier transport of goods. Darnell's Store also served as the post office in Doswell for a time at the beginning of the twentieth century, which was a common function rural, crossroads stores often served. Both Cobb Store (042-0341) and Stanly Store (042-0352) are two-story, three-bay, general stores located in small, crossroads towns in Hanover County built around the turn-of-the-century that feature a front-gabled roof with one-story flanking wings.

Daniel E. Campbell married Emma Beazley Campbell in 1900 and together they had four daughters and a son (U.S. Census 1900; 1920). Daniel E. Campbell owned and ran the general merchandise store for over 50 years while simultaneously was an active member of the Doswell community through his work with the local Tri-County State Bank he assisted in establishing, operating a local excelsior mill, and running a hotel in Doswell (Figure 3-165) (HaCDB 167:120). Daniel Campbell also sold off or divided much of the 6.5 acre lot that the store was built upon until it sat, by 1955, on the 0.62 acre lot that exists today (Figure 3-166).

FIGURE 3-165: EXAMPLES OF AN ADVERTISEMENT FOR THE STORE FROM THE *HERALD PROGRESS* IN THE 1940S (THE HANOVER COUNTY HISTORICAL SOCIETY 1993: 120)

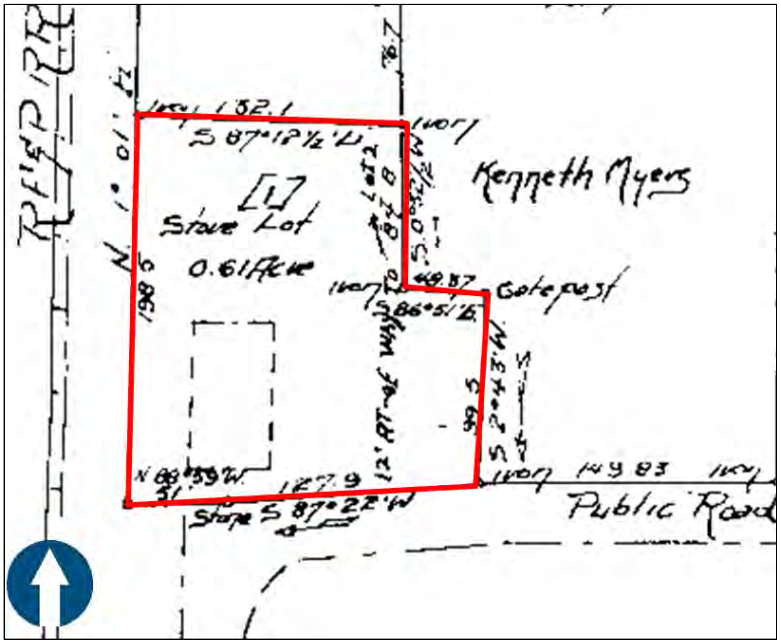

FIGURE 3-166: DETAIL FROM THE PLAT OF THE STORE LOT D.E. CAMPBELL AND ADJACENT PROPERTIES FROM 1955 (HACPB 22:129). NOTE "STORE LOT" OUTLINED IN RED. (MAP NOT TO SCALE)

Daniel Campbell died in 1935, leaving his estate to his wife Emma (HaCDB 167:120). She died in 1954 and, as was stipulated in D.E. Campbell's will, the land then transferred to two of their daughters, Dorothy E. Campbell and Mary Catherine Campbell Wright, who acted as trustees for the store (HaCDB 167:120; Hanover County Will Book [HaCWB] 2:121). In 1966, they sold the store and lot to Roy L. Darnell Sr. and his wife, Georgie L. Darnell. It is not clear who ran the store after D.E. Campbell's death until the Darnell's purchased it, as no one is noted in the census as doing so, though the family is listed as having "other income sources", which may include running the store with the help of a manager (U.S. Census 1940).

Roy Darnell Sr. ran the store from the time he purchased it until his death in 1988 (Fredericksburg Free Lance-Star 2005; HaCDB 1221:67). Though Georgie, Roy's wife, continued to hold the property until her death in 1995, the store is noted as being vacant during that time (Fredericksburg Free Lance-Star 2005; HaCDB 1221:67). Upon Georgie's death, her son Roy Darnell Jr. was named as the trustee to her estate, and he put the property up for auction in 1996. Suzanne Fleet purchased the store and currently runs it as an antique store called "Squashapenny Junction" (HaCDB 1221:67).

3.13.2 Architectural Description

3.13.2.1 Primary Resource Exterior

The Darnell Store, a former general store located at 10570 Doswell Road, is a two-and-a-half-story, three-bay, frame, commercial building constructed around 1898 in a vernacular form with a rectangular plan (Figures 3-167 and 3-168). The building rests on a continuous, pier-type, poured-concrete foundation with visible form mark which supports a balloon-frame structural system clad in weatherboard siding with wood corner boards. A monitor-type roof primarily covers the building, while a wide, front-gabled roof is situated on the south elevation (façade)—all of which is sheathed in standing-seam metal. The front-gabled section appears to be original to the building's construction. An interior-slope brick chimney pierces the roof on the east side of the roof ridge in the southeast corner of the building while a metal flue is situated in the northeast corner. An additional brick chimney stack is visible on the west side of the roof's ridge.

The primary entrance, centered on the façade and surrounded by a wood frame, is filled with a double-leaf, wood, three-paneled, half-glazed door covered by wood, screen doors (Figure 3-169). A large, wood-frame, two-light transom is set above the entrance and is covered by a metal grate. Other fenestration includes single and paired, six-over-six, wood-frame, double-hung sash windows; single and ribbons of multi-light, wood-frame, casement; and single one-over-one, wood-frame, double-hung sash windows. A majority of windows are flanked by wood, board-and-batten shutters and several are covered by metal grates. Secondary entrances were observed on the north and east elevation; the north entrance is filled with a single-leaf, wood-frame, six-paneled door and the east entrance features a similar door covered by a wood-frame, screen door (Figure 3-170). A shed-roof, entry porch with a wood deck set up on wood piers is situated in front of the east entrance. The roof is supported by turned, wood posts and the porch is accessed by a set of wood steps. A wood entry porch raised on wood pierces accessed by a set of steps is lined with a wood rail is situated in front of the southern entry. A cellar entrance is off-centered on the east elevation and is filled with a concrete bulkhead with a metal door. A one-story, full-width porch spans the façade. The wood deck set on parged concrete-block piers is covered by a hipped roof supported by squared, wood posts.

3.13.2.2 Primary Resource Interior

Although the DC2RVA Team intended to complete a full Phase II architectural survey on this property, including interior photographs and floor plans of the entire building, the owner only granted access from the public right-of-way. Access was granted to the entire exterior of the property during the Phase I architectural survey, and several photos are noted as being taken during that survey conducted in February 2016.

3.13.2.3 Secondary Resources

A circa-1960, one-story, one-bay, poured-concrete battery house, is located east of the primary resource (Figure 3-171). Wood form marks are visible on the building's exterior. It is covered by a concrete, front-gabled roof. Situated immediately east of the store is a circa-1920, concrete well superstructure covered by a circular well cap with a central metal water pump.

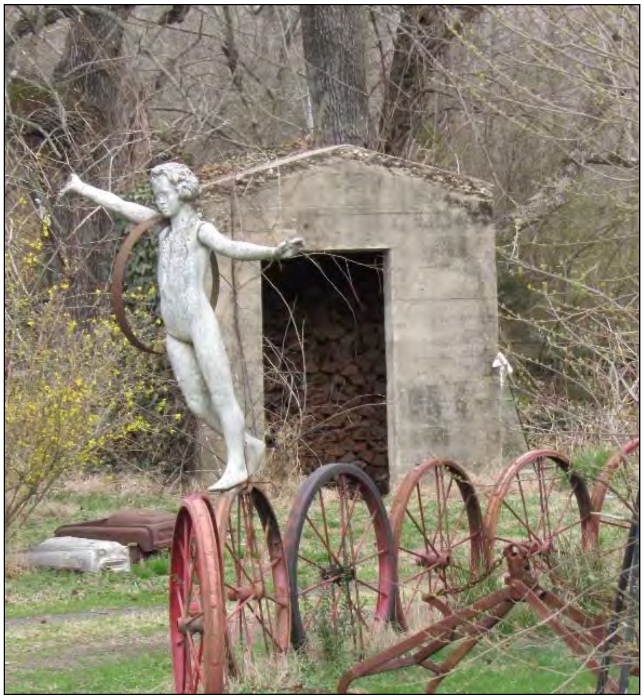

FIGURE 3-171: BATTERY HOUSE, SOUTH ELEVATION

North of the store is a circa-1910, one-story, frame storage building, noted by the current property owner to have been originally used as a stock barn and tack storage building (Figures 3-172 and 3-173). The building is set on a concrete-block pier foundation which supports a frame structural system clad in standing-seam, pressed metal. A sign on the east elevation reads "Bulk Plant Food Station". The rectangular building is covered by a side-gabled roof, with wide eaves featuring exposed wooden rafter tails, and is clad in v-crimp pressed metal. Three modern, metal turbines pierce the roof ridge and are evenly spaced. Two single-leaf, sliding metal doors situated on a metal rail system are located on the south elevation of the building. Window openings have been filled with plywood board.

3.13.3 NRHP Evaluation

The general store in Doswell, now known as the Darnell Store, was built by Daniel Campbell around 1898. Although it was an important store in Doswell, there are small general stores in many nearby crossroads communities throughout Hanover County that emerged from similar commercial trends and the store is not associated with important events that have made a significant contribution to the broad patterns of history. It is also no longer used as general store. For these reasons, it is recommended that the resource is not eligible for listing in the NRHP under Criterion A.

For a resource to be eligible under Criterion B, it must have an association with a person who is "individually significant within a historic context" and has "gained importance within his or her profession or group" (Shrimpton et al. 1990). Furthermore, they "must be shown to have played a distinctively significant role in comparison with other to qualify" a resource as eligible under this criterion (Bolland n.d.). Daniel Campbell played an important role in the growth of the Doswell community; he supplied the land for the Tri-County Bank and served as a board member for it, part owned the Old Dominion Excelsior Mill, as well as operated the general store. This was a fairly common trend in RF&P Railroad towns within Hanover and surrounding counties, as local entrepreneurs would promote short periods of growth within underutilized towns. Campbell was not known to be particularly important or unique in this regard, and his ownership of the general store does not constitute eligibility. As such, the Darnell Store is recommended not-eligible under Criterion B.

The Darnell Store follows architectural trends in form, massing, and location to other general stores throughout Hanover County. Both Cobb Store (042-0341) and Stanly Store (042-0352) are two-story, three-bay, general stores located in crossroads towns in Hanover County built around the turn-of-the-century that feature a front-gabled roof with one-story flanking wings. Though the Darnell Store is in generally good condition and maintains a moderate-to-high level of integrity of design, materials, and workmanship, it is not unique in the area or to Hanover County as a whole. As such, it is recommended that the resource is not eligible for listing in the NRHP under Criterion C. As an architectural resource, it was not evaluated under Criterion D.

In sum, the Darnell Store is **recommended not eligible under Criteria A–C.**

The Darnell Store is located within the Doswell Historic District (042-5448). It was built during the district's period of significance (ca. 1880–1958) and exemplifies architectural trends throughout the community. For these reasons, the resource is **recommended to contribute to the eligibility of the Doswell Historic District.**

3.14 TRI-COUNTY BANK–DOSWELL BRANCH (042-0469)

The Tri-County Bank–Doswell Branch (Tri-County Bank) is located on the south side of Doswell Road, east of the railroad tract within the heart of Doswell Historic District (042-5448) in Hanover County (Figure 3-174). The bank is situated close to the roadway on a narrow lot measuring approximately 0.08 acre, primarily filled with the building. A manicured grass lawn spotted with shrubbery and plantings immediately surrounds the building. A gravel walkway extends from the road in the west of the parcel towards the façade (west elevation) and continues around the south side of the building to the rear (east) where the yard is filled with pebbles. The north and west boundaries of the property are lined with a metal post fencing with metal chain. The rear yard is enclosed by ornamental three-rail iron fencing and shrubbery. No secondary resources were observed. The resource was previously recorded with the DHR in 1990 and surveyed again in 2008 when it was recommended potentially eligible for listing in the NRHP under Criterion A for its role in Hanover County's commercial history as well as Criterion C for architecture.

3.14.1 Historic Context

The Tri-County Bank was first charted as the Doswell State Bank by the Secretary of the Commonwealth on August 20, 1920, and was authorized to begin business on February 1, 1921 (The Hanover County Historical Society 1993:85; Jones 1921:366). In September 1920, Daniel E. Campbell and his wife, Emma, sold a lot, listed as Lot No. 4 on a 1874 plat, "facing the railroad and County Road" to the Doswell State Bank for $200 (Figure 3-175) (HaCDB 7:390, 71:127–128). The 1920 county tax records specify that when notable Doswell developer Daniel Campbell owned the 0.25-acre tract in Doswell in the early-twentieth century, there were no buildings on the property (Hanover County Tax Record Book [HaCTRB] 1920). The following year, the 0.25-acre tract was noted to be owned by Doswell State Bank and contained buildings worth $990 (HaCTRB 1921).

Although more than 600 banks across the country, mainly in rural areas, failed each year during the late 1920s and 1930s, Doswell State Bank held strong despite the poor economy (Federal Deposit Insurance Corporation [FDIC] 2005). However, some effects of the deteriorating banking conditions were visible when the stock of Doswell State Bank was taken over and merged with the larger operation of Tri-County Bank and continued operations under that name as their Doswell branch. It is not clear exactly when the banks merged; however, the first mention of the building being called Tri-County Bank was in 1934 (The Daily Press 1934). Tri-County Bank also had branches in Mechanicsville, Beaverdam, and Hanover. In March 1934, the Virginia State Corporation Commission suspended business in banks for 60 days and, during this period, existing notes could continue to gain interest, new deposits would not be accepted, and new loans would not be granted—all an effect of the Great Depression (Commonwealth of Virginia State Corporation Commission 1935:158–159). In 1957, the bank building was robbed by a gunman who stole almost $3,000 (The Daily Press 1957). The bank business moved to U.S. Route 1 in 1961, and the Doswell branch building was sold in February 1964 to Roy L. Darnell (Board of Governors of the Federal Reserve System 1961; HaCDB 231:200). The building remained in the Darnell family until 2005 when it was sold to Suzanne Van Buiten Fleet, owner of the antique store now situated in the bank and the former general store (042-0470) located immediately north (HaCDB 1968:149, 2637:72).

3.14.2 Architectural Description

3.14.2.1 Primary Resource Exterior

The Tri-County Bank, located at 10561 Doswell Road, is a two-story, three-bay, masonry building constructed circa 1920 in a vernacular commercial building style with limited Colonial Revival elements. The building is set on a continuous, poured-concrete foundation supporting a masonry structural system constructed of brick three wythes thick (Figure 3-176). The brick is laid in a seven-to-one common bond on all elevations save for the façade, which is laid in an English bond. The façade also features three inset panels with six-point metal stars as well as a large, circular metal sign reading "BANK" (Figure 3-177). Three metal hoods shielding rain spouts are evenly spaced on the north and south elevation, and the north elevation also features a decorative metal bracket that once held a sign at the second story. The building is covered by a flat roof surrounded by a stepped, brick parapet with brick coping along the north, west, and south elevations; a metal eagle sits centrally atop the parapet on the façade. Two interior-end brick chimneys are evenly spaced on the north elevation while a similar chimney is situated in the southeast corner of the building.

FIGURE 3-176: SITE PLAN OF THE TRI-COUNTY BANK (NOT TO SCALE)

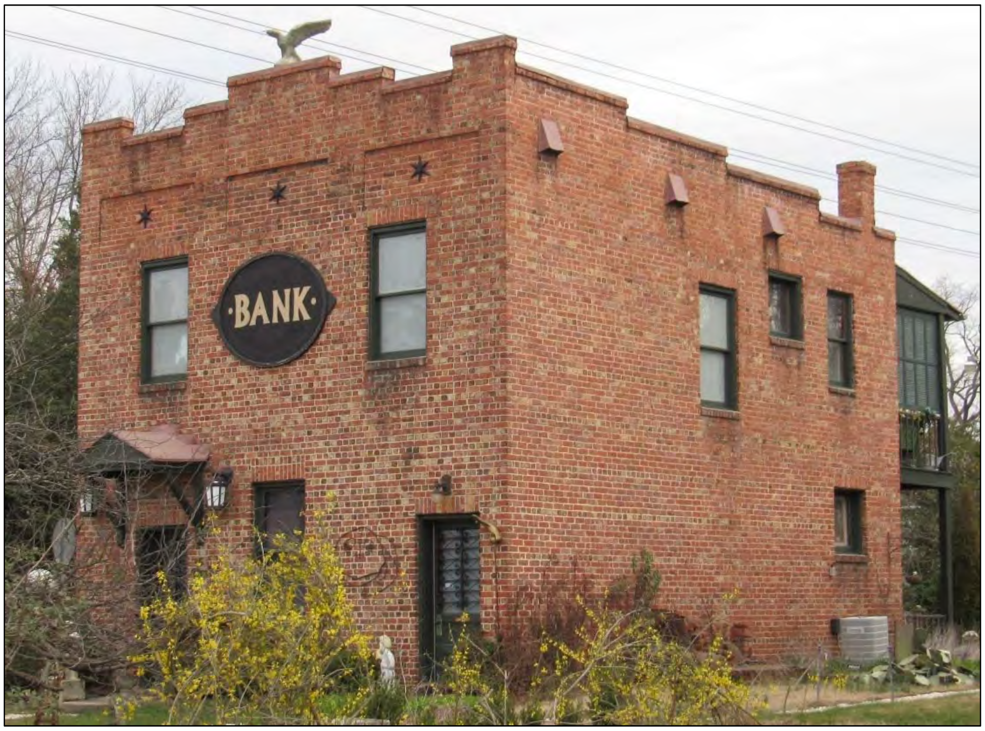

FIGURE 3-177: SOUTHWEST OBLIQUE SHOWING STEPPED PARAPET, PENT ROOF, COMMON AND ENGLISH BRICK BONDS

The primary entrance, slightly recessed in the north half of the façade, is filled with a single-leaf, wood, paneled door framed by a wood surround emphasized with a brick soldier lintel (Figure 3-178). Window openings are filled with single, one-over-one, wood-frame, double-hung sashes that appear to be replacements and all feature a brick header sill and brick soldier lintel. A gabled, metal-sheathed hood supported by wood brackets is set above the primary entrance which is flanked by metal light fixtures. A two-story, full-width porch spans the rear elevation (Figure 3-178). A concrete deck on the first story and a wood deck on the second story are covered by a shed roof supported by squared wood posts. The first- and second-story decks are lined with an iron hairpin balustrade; however, the north elevation of the second story of the porch is partially filled with bead board.

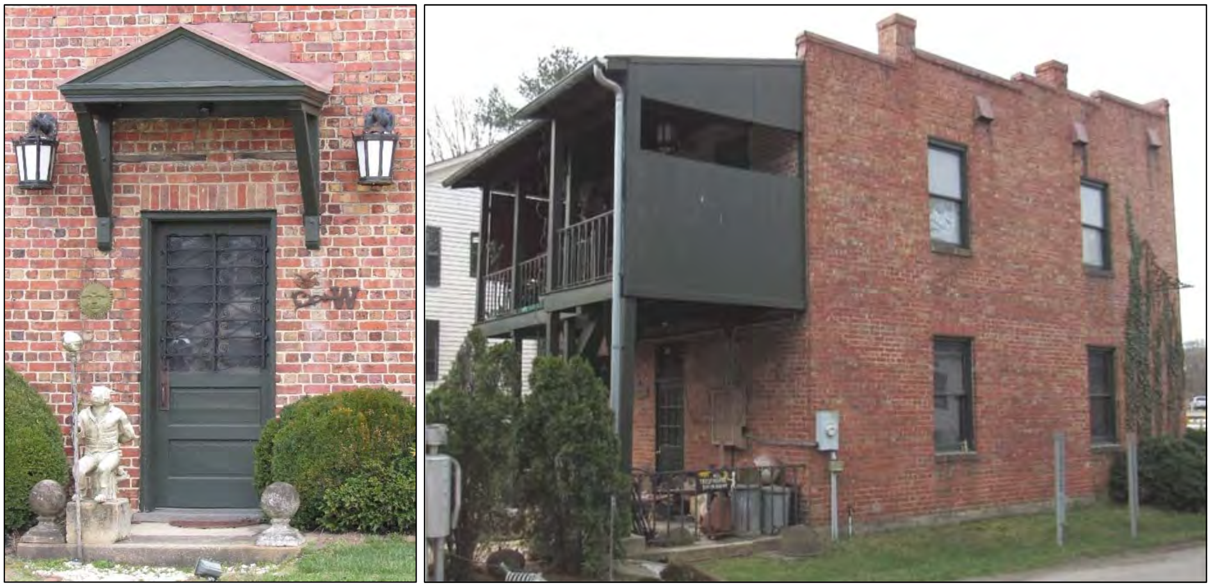

FIGURE 3-178: DETAIL OF PRIMARY ENTRANCE WITH PENT ROOF ON WEST ELEVATION (LEFT); SOUTHEAST OBLIQUE FEATURING SECOND STORY REAR ADDITION (RIGHT)

3.14.2.2 Primary Resource Interior

Interior access was denied by the current property owner during this effort.

3.14.3 NRHP Evaluation

Banks and insurance companies have been operating in Hanover County from as early as 1796 (Land and Community Associates 1992). By the early-twentieth century, several villages in the county had banks including Mechanicsville, Hanover, Beaverdam, and Doswell; each of those were eventually owned by Tri-County Bank, Inc. (Land and Community Associates 1992). The need for the banks indicates the consistent prosperity the county experienced during the first several decades of the twentieth century. In terms of location, setting, feeling, and association, the resource retains a moderate to high amount of integrity. The financial institution, although important to the Doswell community for the early- to mid-twentieth century, has not been used as a bank for approximately 50 years. For these reasons, it is recommended that the resource is not eligible for listing in the NRHP under Criterion A.

Daniel Campbell played a role in the growth of the Doswell community and the establishment of this financial institution, and his association has proved to be fairly minimal through archival research; therefore, the resource is not eligible under Criterion B.

There are several other early twentieth century bank buildings in Hanover County. Two of these banks are one-story brick buildings, located in Mechanicsville and Hanover. The Mechanicsville Bank (042-0751) is stuccoed and features many replacements such as fenestration and exterior materials. Hanover Bank (042-0294), built 20 years after the Tri-County Bank in Doswell, has several Colonial Revival-style details, such as a rusticated basement story, rounded window arches, and a corbelled cornice. The Beaverdam Bank (042-0496), built circa 1910, is similar in massing to the Tri-County Bank in Doswell and also has a corbelled façade cornice. However, it also contains replacement fenestration and is suffering from neglect. All three resources have not been evaluated for NRHP eligibility by DHR staff. The Tri-County Bank does feature several replacement materials; however, these alterations are minimal and only marginally affect the integrity of design, materials, and workmanship of the building. The Tri-County Bank is a strong example of an early-twentieth century masonry commercial building concentrated in a formerly prosperous railroad community, and it retains a sufficient amount of integrity to warrant recommendation for eligibility under Criterion C for architecture at the local level. As an architectural resource, it was not evaluated under Criterion D.

In sum, the Tri-County Bank–Doswell Branch is **recommended eligible under Criterion C for architecture at the local level.**

The Tri-County Bank–Doswell Branch is located within the Doswell Historic District (042-5448). It was built during the district's period of significance (1880–1920) and exemplifies architectural trends throughout the community. For these reasons, the resource is **recommended to contribute to the eligibility of the Doswell Historic District.**

The period of significance for the Tri-County Bank–Doswell Branch is from its construction, circa 1920, to its disuse as a bank in 1961. The proposed NRHP boundary for the Tri-County Bank-Doswell Branch comprises and follows the legal lot description for parcel 7883-38-8530 (Figure 3-179). It is bounded on the north and west by Doswell Road, and by parcel 7883-38-9434 on the east and south.

3.15 DOSWELL INN (042-0468)

The Doswell Inn, currently utilized as a single-family dwelling, is situated in the middle of a rural community of Doswell (Figure 3-180). It is located on the east side of Doswell Road prior to it curving north around the Tri-County Bank (042-0469) and east of the railroad tracks within the heart of Doswell's Historic District (042-5448) in Hanover County. The building, situated close to the roadway in the west half of a lot measuring approximately 1.15 acres, is primarily surrounded by a manicured grass lawn. The south boundary and the east half of the lot is filled with matured deciduous and coniferous trees. The west elevation (façade) is lined with shrubbery. A private, unpaved road that provides access to the Doswell Inn extends south from Doswell Road, runs east past the Tri-County Bank (042-0469) and the Doswell Inn and terminates at the House at 10571 Doswell Road (042-0467). Associated with this resource is a workshop, which sits east of the dwelling.

3.15.1 Historic Context

The dwelling at 10567 Doswell Road, locally and historically known as the Doswell Inn, is situated on approximately 1.15 acres on the east side of the RF&P Railroad in the small hamlet of Doswell. For a larger history of the community of Doswell, see the section for the Doswell Historic District (page 3-139).

In a deed dated March 1875, Edmund and Bettie Winston and Nathaniel and Jennie Cook, husband and wife, sold six lots, two of which were known as lots no. 3 and 4 as labeled on an 1874 plat, "being part of Hanover Junction", to J.B. Denton for $637 (**Error! Reference source not found.**Figure 3-181) (HaCDB 7:390; HaCDB8:364). J.B. Denton (1829–1894) was a merchant in Richmond, as well as a property owner in the town of Ashland (HaCTRB 1875; U.S. Census 1870). County tax records from 1875 specify that when J.B. Denton acquired the tracts in Doswell, there were no buildings on the property (HaCTRB 1875). Following J.B. Denton's death in a will dated September 1898, he requested that the "two lots of 1.75 acres on the east side of the RF&P Railroad at Doswell, and lot No: 8 to sell at private of public auction." These lots were conveyed to Susan Lumpkin Barker who then sold lots no. 3 and 4 to Daniel E. Campbell, a locally prominent entrepreneur, in 1913 for $4,000, though the inn is listed as already having been built at the time of the sale (HaCDB 6:329; 58:96; Virginia Birth Records 2000; Virginia Death Records 2015). It is likely that Campbell, who is discussed further on page 3-153, rented the land from Mrs. Barker and constructed the building prior to his purchase in 1913.

Archival records suggest that Daniel Campbell built the Doswell Inn between 1900 or 1910. Due to the layout of the rooms on the second story of the building, coupled with personal correspondence with the current home owner, there is some evidence to suggest that the Doswell Inn was also a home for local school teachers; however, additional primary evidence was not uncovered during the current investigation to substantiate this claim. Census records list Daniel Campbell as a merchant and proprietor between 1910 and 1930. (Fredericksburg Free Lance-Star 2005; Roxanne Pizarro, personal communication 2018; U.S. Census 1910, 1920, 1930).

FIGURE 3-181: LOTS NO. 3 AND 4 (DENOTED IN RED) ON 1874 PLAT (HACDB 7:390) (NOT TO SCALE)

Daniel Campbell died in 1939, leaving his estate to his wife, Emma (HaCDB 167:120; Virginia Death Records 2015). She died in 1954 and, as was stipulated in Daniel Campbell's will, the land was then transferred to two of their daughters, Dorothy E. Campbell and Mary Catherine Campbell Wright, who acted as trustees for the property (HaCDB 167:120; HaCWB 5:121). In 1955, they sold the inn and lot to Roy L. Darnall Sr. and his wife, Georgie L. Darnall.

The Darnall family owned the property until 2002, and the property has since changed hands three times. The building is currently owned by Gregory D. Hall and Roxanne Pizarro (HaCDB 1968:149, 3126:701).

3.15.2 Architectural Description

3.15.2.1 Primary Resource Exterior

The Doswell Inn, a former Inn located at 10567 Doswell Road, is a two-story, four-bay, frame building constructed around 1910 in the Colonial Revival style in a rectangular plan (**Error! Reference source not found.**Figures 3-182 and 3-183). The building is set on a raised-brick basement laid in a seven-to-one, common bond which supports a wood-frame structural system clad in weatherboarding siding with wood corner boards (Figure 3-184). A moderately pitched, side-gabled roof sheathed in standing-seam metal features a central gabled peak on the west elevation (façade). The roof eaves are boxed and a simple wood cornice features prominent partial gabled returns on the gabled ends of the building (Figure 3-185). Matching brick chimney stacks pierce the roof on either side of where the central gabled peak (north and south) intersects with the side-gabled roof. An additional pair of interior-end, brick chimneys are located in the north and south half of the east elevation.

The primary entrance, off-centered on the façade and featuring a fluted, pilaster door surround, is filled with a single-leaf, wood, three-paneled door covered by a wood, louvered, storm door (Figure 3-185). A large, wood-frame, single-light transom is set above the entrance and the door is flanked by single-light, wood, paneled sidelights. The entire entrance is flanked by louvered wood shutters with a metal, exterior, wall-mounted light at the north side. Other fenestration includes single, two-over-two, double-hung, wood-framed windows with vertical muntins at the first floor and six-over-six, double-hung, wood-framed windows at the upper level, most of which are flanked by louvered wood shutters. The gable ends feature circular, wood, decorative vents. Paired, two-light, wood-frame, casement windows are situated in the basement level; however, some of the windows are completely covered with pressed metal.

A full-width, one-story porch spans the façade. The porch is set on a brick-pier foundation topped by a wood floor and is covered by a hipped roof supported by wood Tuscan columns. It is accessed by a recently constructed set of wood steps and lined by a turned wood balustrade that appears original to the construction of the building. A one-story, two-bay porch extends from the center of the east elevation (Figure 3-186). Its brick-pier foundation features wood lattice infill, supporting a wood floor, and a shed roof with squared wood posts. The porch is primarily lined by a simple wood balustrade with square rails while the north elevation is screened by wood lattice. A recently constructed set of wood stairs with a wood railing provides access the east porch. A one-story, gabled, exterior, cellar entryway extends from the north corner of the east elevation (Figure 3-186). It is clad in the same materials as the core of the building.

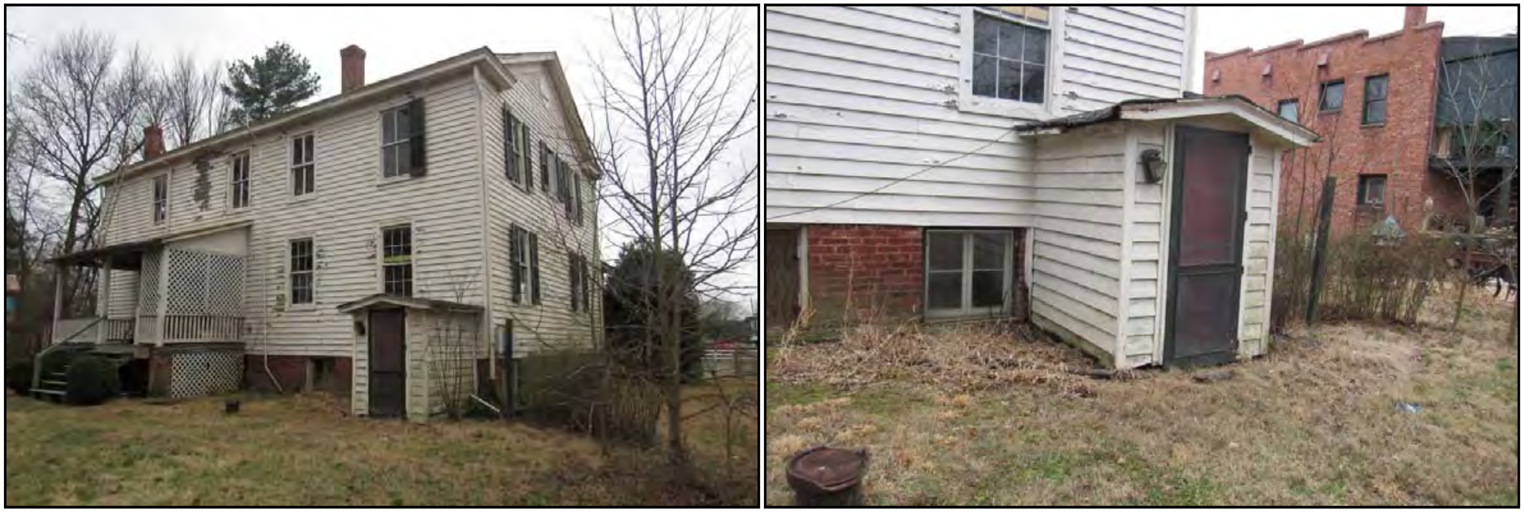

FIGURE 3-186: NORTHEAST OBLIQUE (LEFT); CELLAR ENTRANCE ON NORTH SIDE OF EAST ELEVATION (RIGHT)

3.15.2.2 Primary Resource Interior

On the interior, the first floor is based roughly on a two-pile, central-passage plan and is asymmetrically arranged around a transverse hallway with a staircase rising in the southwest corner (Figures 3-187 through 3-189). Narrow, wood, tongue-in-groove-flooring is found throughout the dwelling. As the building is in the midst of rehabilitation and renovation, the walls and ceilings were partially exposed, showing parts of the frame structural system. Original walls were clad in shiplap and later covered by a type of cardboard (Figure 3-189). Moldings are simple, and the paired brick chimneys feature single-sided fireplaces with Victorian-era wood mantels (Figure 3-190). The second floor is laid out in a dormitory-style plan around a central hallway that generally runs north to south. Many of the original walls are gone; however, ghosting and open framing showcase a series of individual rooms accessible by single-leaf wood-panel doors, each topped by an awning transom. The doors are set in wood door surrounds which retain their original metal room numbers (Figures 3-191 and 3-192).

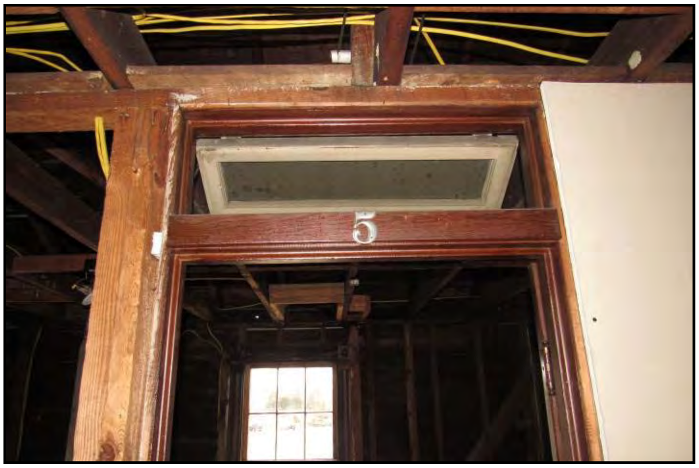

FIGURE 3-192: DETAIL OF ROOM NUMBER, SECOND STORY

3.15.2.3 Secondary Resources

A circa-1950, one-story, gabled workshop is located on the southeast side of the parcel, approximately 155 feet east of the dwelling. The building was not accessible during the current survey; however, current aerial imagery indicates that it is covered by a front-gabled roof.

Two circa-1970, concrete well superstructures are located east of the primary resource and are covered by circular, concrete caps (Figure 3-193). An unknown metal superstructure is located immediately east of the primary resource, and it measures approximately 1 foot in height. It is possible that the superstructure is access to a gas tank; however, the current owner could not corroborate this (Figure 3-194). A circa-1910 stone slab is located east of the primary resource near the wells. According to the owner, it is possible that this slab was used as a possible carriage or horse step; however, it may have served as a possible tank slab (Figure 3-194) (Roxanne Pizarro, personal communication 2018).

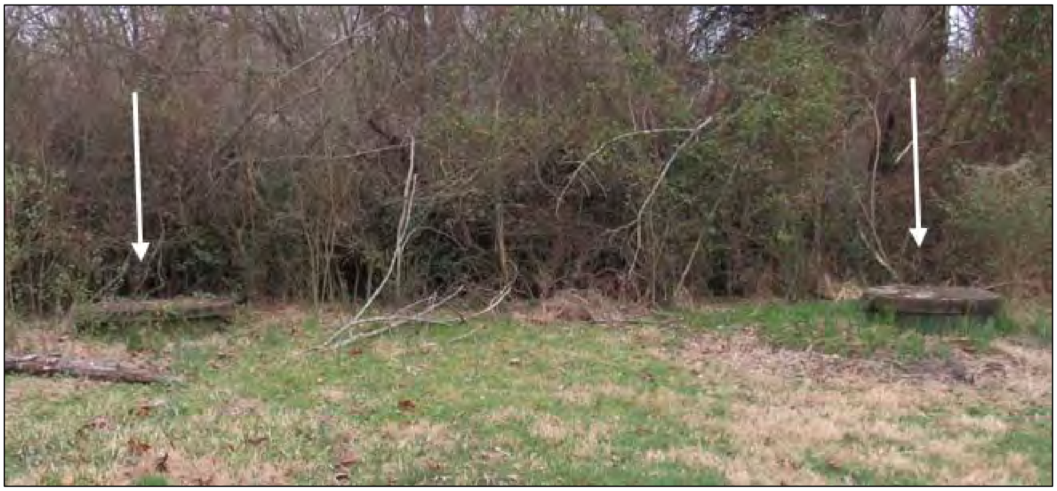

FIGURE 3-193: VIEW OF WELLS, LOOKING EAST

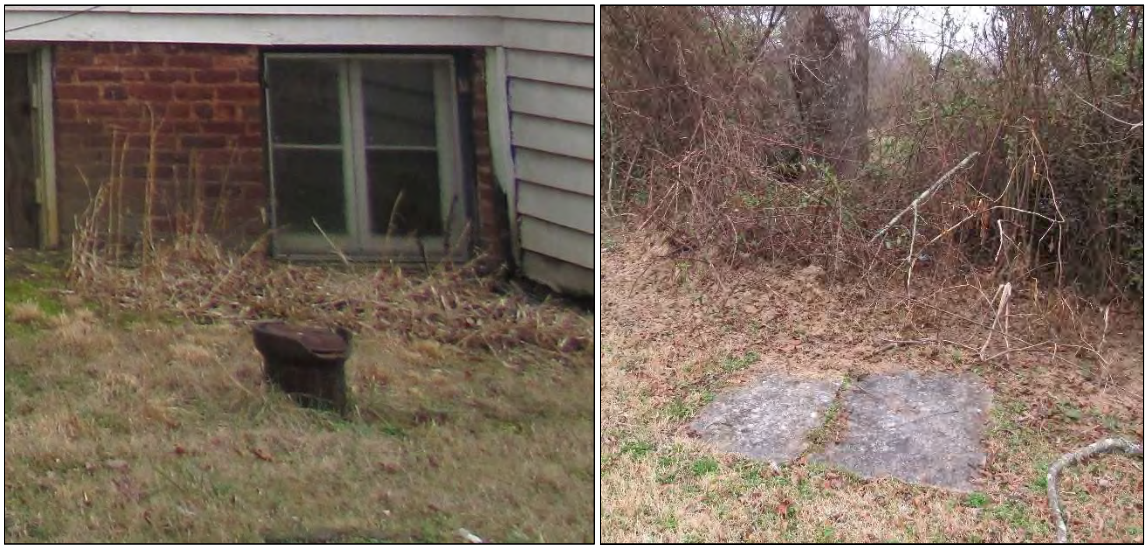

FIGURE 3-194: VIEW OF METAL SUPERSTRUCTURE, LOOKING NORTHWEST (LEFT); VIEW OF STONE SLAB, LOOKING EAST (RIGHT)

3.15.3 NRHP Evaluation

The building at 10567 Doswell Road, historically known as the Doswell Inn, is a two-story, frame building constructed around 1910 in the Colonial Revival style. The Doswell Inn follows trends in form, massing, and location to other dwellings throughout Hanover County, but is the only known building to have served lodgers in Doswell in the early-twentieth century. In terms of location, setting, feeling, and association, the resource retains a high level of integrity. Late-nineteenth century inns, modeling large dwellings, were often located in crossroads and railroad communities which allowed convenient lodging for travelers. The Doswell Inn, although important to the Doswell community from the late-nineteenth to mid-twentieth centuries, has not been used as an inn for approximately 70 years. It is not known to have been the site of any important events nor is it known to have made significant impacts on the hospitality industry in Hanover County. For these reasons, it is recommended that the resource is not eligible for listing in the NRHP under Criterion A. Although Daniel Campbell played an important role in the revitalization of the Doswell community at the turn of the twentieth century, his role in the establishment of the Doswell Inn and his association has proved to be minimal through archival research; and therefore, the resource is not eligible under Criterion B.

The Doswell Inn follows general stylistic trends in form, massing, and architectural style to other residential and commercial buildings throughout Hanover County. Over 200 resources in Hanover County surveyed with the DHR are listed as containing characteristics of the Colonial Revival style. Resource types include but are not limited to single- and multi-family dwellings, varying types of commercial buildings, religious buildings, and educational buildings. Though the Doswell Inn is in generally good condition and maintains moderate to high level of integrity of design, materials and workmanship, due to the prevalence of the Colonial Revival style in Hanover County as a whole, it is not considered particularly unique in the area. Furthermore, the interior of the building has undergone a series of alterations, which has further diminished the integrity of the resource as a whole. As such, it is recommended that the resource is not eligible for listing in the NRHP under Criterion C. As an architectural resource, it was not evaluated under Criterion D.

The Doswell Inn is located within the Doswell Historic District (042-5448). It was built during the district's period of significance (ca. 1910-1950) and represents architectural trends throughout the community. For these reasons, the resource is **recommended to contribute to the eligibility of the Doswell Historic District.**

3.16 DOSWELL DEPOT AND TOWER (042-5466)

The Doswell Depot and Tower (historically known as the C&O Railroad/RF&P Railroad Station and HN Tower) (042-0093; 042-5466) is located at 10577 Doswell Road. As per communication with the DHR, the resource was combined under the DHR identification number of 042-5466 (Blake McDonald, personal communication 2018). The depot, the primary resource, is currently used as the offices of the Buckingham Branch of CSXT (Figure 3-195). Constructed in 1927 shortly after a circa-1907, frame, passenger station burned at this location, the depot faces north and is set back from the south side of Doswell Road just west of the railroad tracks within the Doswell Historic District (042-5448). The HN switch tower associated with this property, being one of three remaining along this line in the Commonwealth of Virginia, is located southeast of the depot on the east side of the tracks (Railroad Signals of the U.S. 2012). Both resources are located on cleared parcels of land currently belonging to CSXT and largely surrounded by grassy lawns and gravel (Hanover County Tax Records 2015). A gravel parking area situated northwest of the depot building and a gravel drive extends from Doswell Road on the east side of the tracks south towards the tower.

3.16.1 Historic Context

The circa-1927 Doswell Depot and Tower is located on a site that has contained a train depot since at least the mid-1850s. In 1834, the RF&P Railroad was chartered, and by 1836, a line was running north-south between Richmond and Fredericksburg, through Doswell, formerly called Hanover Junction. The C&O Railroad, which originated as the Louisa Railroad, began in 1836 as a feeder line extending from Gordonsville east to Doswell in an effort to connect area markets and producers with the RF&P Railroad. Shortly after completion of the Louisa Railroad, the area became known as Hanover Junction, due to the intersecting tracks running though. In 1846, William Williamson, Edmund Morris, and Burton W. Morris, large landholders and developers, sold 2.5 acres of land, "lying and being at the junction of the RF&P and Louisa Railroads," to the President Directors and Company of the Louisa Railroad (HaCDB 5:121). Two acres of the lot were noted as being located on the south side of the Louisa Railroad line and 0.5 acre on the north side. It is likely around this time that the first joint passenger and freight depot was built on the lot as a station, as noted on maps from the Civil War (Figure 3-196).

Due to the intersection of two important railroads at Hanover Junction, the area was a point of contention during the Civil War. It was a critical supply point for the entire Confederate Army in Virginia as it connected the battlegrounds to the north and the supplies from the Shenandoah Valley to each other, as well as to the Confederate capital of Richmond (Miller n.d.). The original depot was destroyed during this time and was replaced by a temporary building and water station (Land and Community Associates 1992). This structure stood until a permanent station could be built around 1870.

(HOTCHKISS 1895). NOTE LOCATION OF HANOVER JUNCTION AND THE INTERSECTION OF THE RAIL LINES. (MAP NOT TO SCALE)

In 1874, the depot lot expanded to include a lot containing about 1 acre, situated at the northwest corner of the RF&P and C&O Railroads, from the estate of a prominent Hanover County citizen, Phillip B. Winston, to the RF&P Railroad Company (HaCDB 8:48). This lot is noted as being lot 19 of the plat of the division of Winston's estate (Figure 3-197) (HaCDB 7:390). This enlarged the depot lot to include the entire area between the junction of the two railroads and what is now Doswell Road. In 1907, a new depot was built to replace the circa-1870 building (Daily 2015). Just 20 years later in 1927, the depot burned down and was replaced by the current, Classical Revival-style station that stands today (Daily 2015). The central block of the depot was the passenger waiting room, while the eastern wing was used as the ticket office and the western wing served as an office for the freight service (Land and Community Associates 1992).

At about that same time, in 1929, the HN switch tower was constructed, which served as a structure that housed electrical systems that managed an interlocking device permitting safe crossing of trains over both railroads (Daily 2015). The HN switch tower was constructed in much the same way that other towers along the railroad were built, with an interlocking machine located trackside that the tower would then be built around. The second floor of the tower would hold the office for the operator who controlled the interlocking machine though a series of levers which realigned and shifted the tracks (Bupp et al. 2016). The HN switch tower was built during the second (late-1900 to 1930s) of three main periods for tower architecture, that period being characterized by a shift from wood to masonry framing so as to be fireproof (Bupp et al. 2016).

The tower was retired in 1958 when the railroads centralized control in Richmond. It is likely at this time that the station was primarily retired as well. From that point until 1970, passenger trains would only stop at the depot on a case by case basis (Daily 2015). In 1992, the depot lot was sold to CSXT (HaCDB 950:847).

3.16.2 Architectural Description

3.16.2.1 Primary Resource Exterior

The passenger depot at 10577 Doswell Road is a circa-1927, one-story, eight-bay, Classical Revival-style building with an I-plan (Figure 3-198) (Daily 2015). It rests on a continuous foundation supporting a frame structural system—both of which are clad in a Flemish-bonded brick veneer with cast-stone quoins (Figures 3-199 and 3-200). It is largely covered by a side-gabled roof with two flanking front-gabled wings, all of which are sheathed in slate shingles. A simple, wood, denticulated cornice lines the tight eaves of the roof, and the gabled ends of the building have prominent partial returns. Metal gutters are built into the eave sides of the building.

An interior-slope, corbeled, brick chimney with a concrete cap pierces the roof in the southern portion of the building.

FIGURE 3-198: SITE PLAN OF THE DOSWELL DEPOT AND TOWER (042-5466)

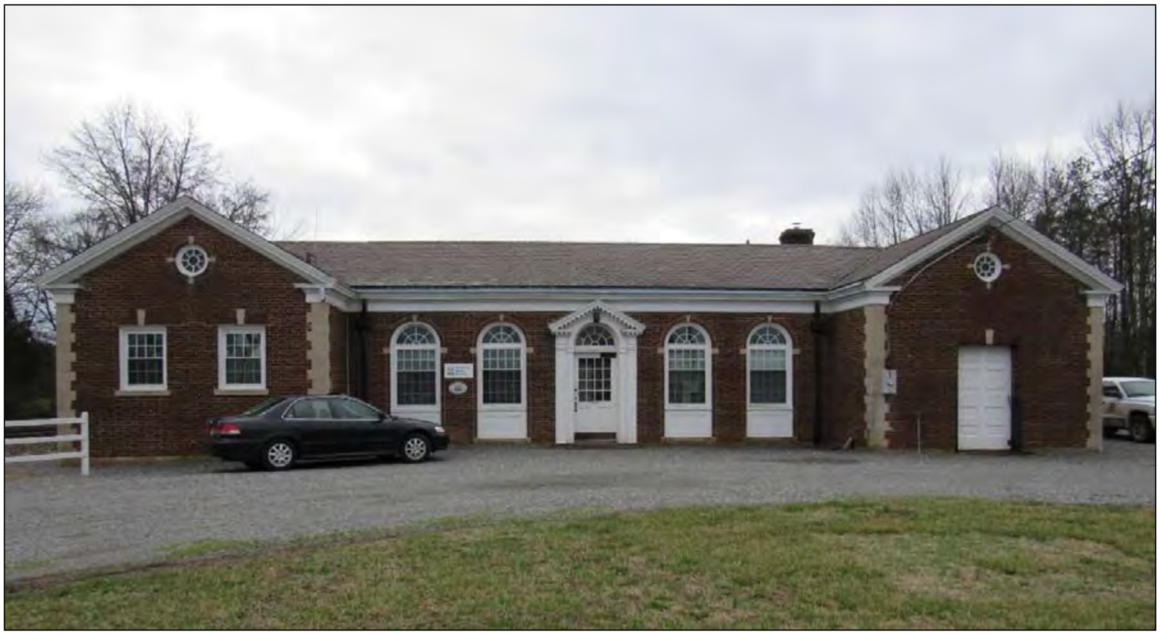

FIGURE 3-199: NORTHWEST ELEVATION OF THE DOSWELL DEPOT

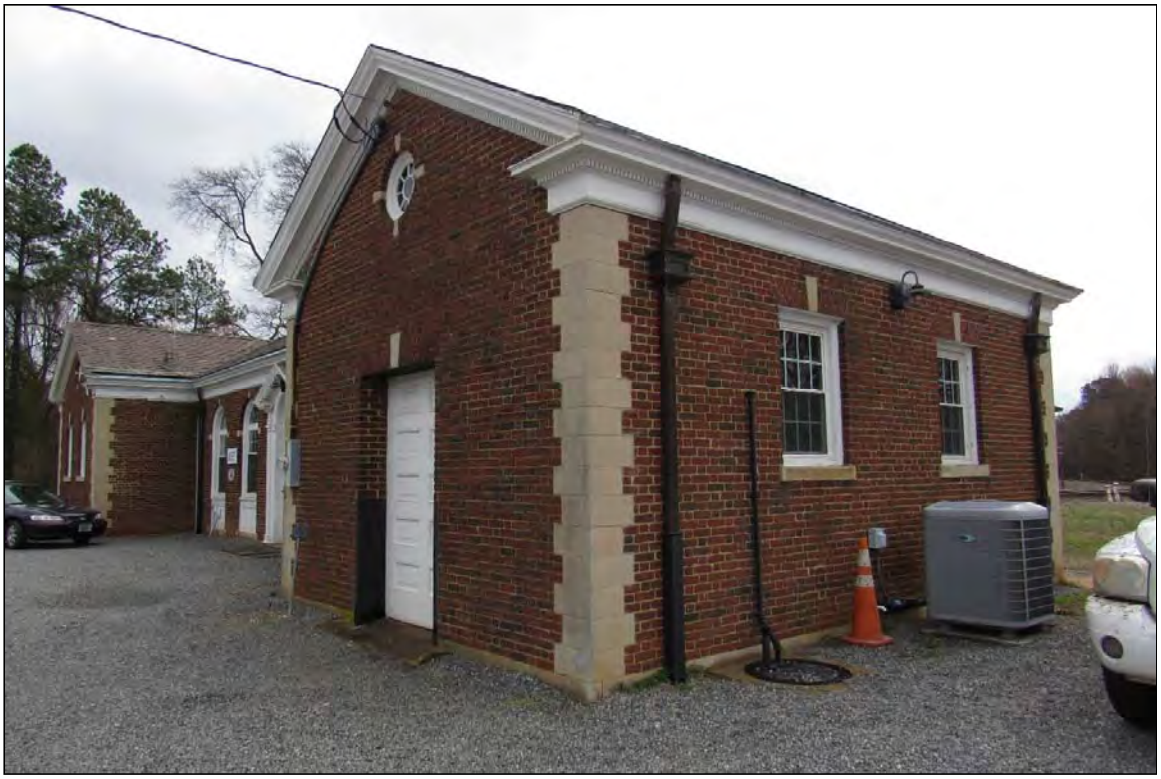

FIGURE 3-200: WEST OBLIQUE OF THE DOSWELL DEPOT

The primary entrance is centrally located on the façade (northwest elevation) and is filled by a wide, single-leaf, half-glazed, wood door topped by a wood-frame fanlight (Figure 3-201). The entrance is surrounded by a classical entablature with a denticulated broken pediment with modillions and plain pilasters. Windows appear to be largely one-over-one, vinyl replacement units with muntins simulating eight or 10 lights over 12 or 16 in the bottom sash. Many windows are topped by fanlights, some of which are replacements, and supported by wooden aprons below. Decorative brickwork includes cast-stone cornerblocks and keystones in semi-circular or splayed jack arches. Original rounded wood windows are situated in the gable ends of both the east and west wings of the building. A one-story, flat roof promenade spans the non-gabled portion of the southeast elevation (Figure 3-202). The roof, supported by squared Doric-style columns, features a denticulated cornice and a paneled parapet. The promenade leads to a secondary entrance filled with the same style door as the primary entrance. An additional entrance is situated in the southeast elevation of the east gabled wing and is filled with a single-leaf replacement door topped with a flat stepped pediment. Another entrance is located on the same elevation of the west gabled wing and is filled with a large single-leaf, wood, paneled door. It is emphasized by a brick jack arch with a central cast keystone. A similar door is located on the northeast elevation of the west gabled wing.

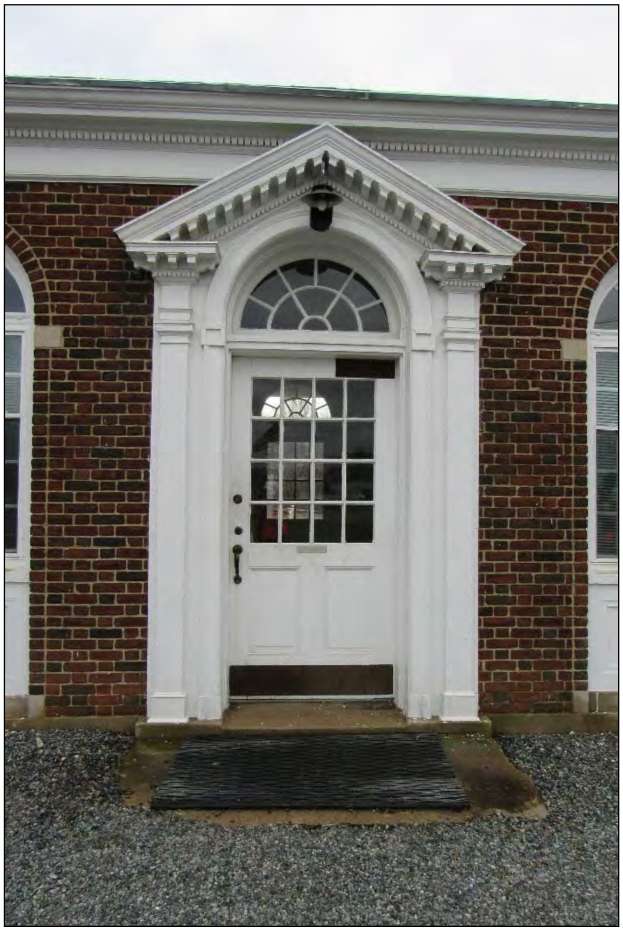

FIGURE 3-201: DETAIL OF PRIMARY ENTRANCE

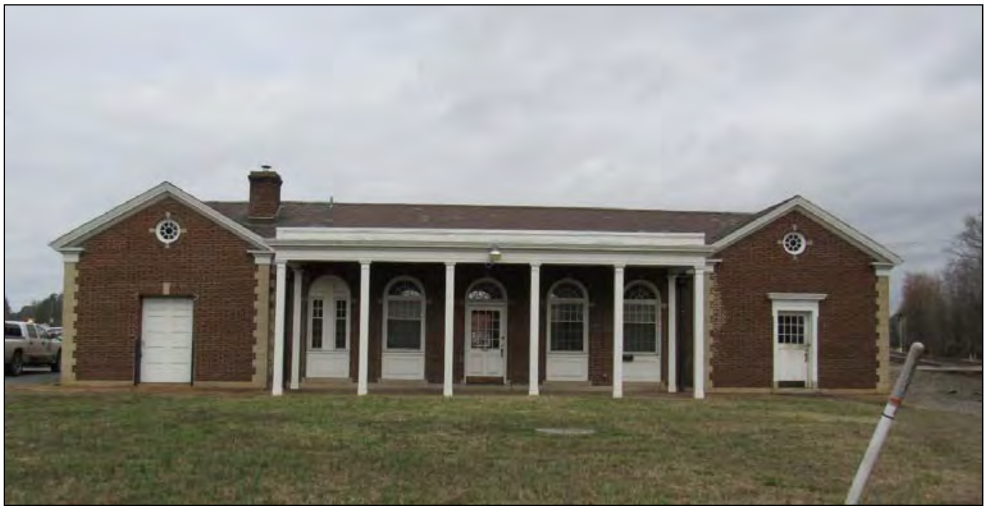

FIGURE 3-202: SOUTHEAST ELEVATION OF THE DOSWELL DEPOT

3.16.2.2 Primary Resource Interior

Interior access was not obtained at the time of the current survey. A brief inspection was conducted, though, in 2008 when the DC2RVA Team completed a reconnaisance evaluation of the building. At that time, the interior maintained its original configuration and details. The central room, once the passenger waiting room, is still a large, open space with wooden floors. The walls are plastered, and wainscotting and a chair rail line the bottom half of each wall. Understated elements of the Classical Revival style can be found in this central space, such as the somewhat intricate chair rail molding profile and matching door surrounds. A notable reminder of the building's historic use is the ticket window that is still extant in the central waiting room (Figure 3-203). A single doorway through the east and west walls allowed entry into each of the wings—the former ticket office in the eastern wing and the previous freight office in the west wing. Both of the wing spaces are also large open spaces with their original hardwood floors and spatial flow.

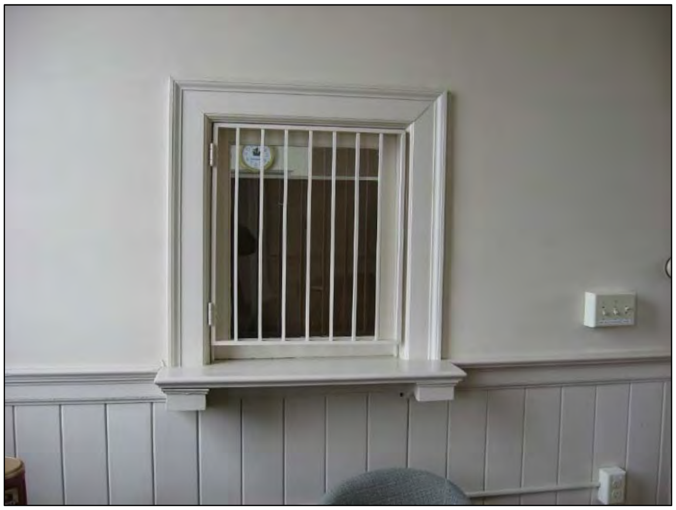

FIGURE 3-203: TICKET WINDOW IN THE CENTRAL WAITING ROOM OF THE DOSWELL DEPOT

3.16.2.3 Secondary Resources

The HN switch tower associated with the passenger depot building is said to have been constructed around 1929 (Figures 3-204 and 3-205) (Daily 2015). This structure housed electrical systems on the ground floor that managed an interlocking device permitting safe crossing of trains over both railroads and an office for an operator on the second floor. The tower rests on a continuous poured-concrete foundation and has a structural system that is clad in a Flemish-bonded brick veneer. The building is covered by a steeply pitched, hipped roof sheathed in asphalt shingles with an interior-slope, brick chimney piercing its southwest corner. The roof's wide overhanging eaves are marked by paired copper-clad brackets. A copper-clad bay window projects from the second story of the tower at the west elevation overlooking the intersection of the RF&P and C&O Railroad tracks and has the letters "HN" embossed on it. This bay window serves as a defining feature for interlocking stations as the projecting bay allowed for better visual observation for the operator along the rail line (Bupp et al. 2016). A metal pipe staircase leads to the tower's upper level at the south elevation. Doors and many windows in the building are currently boarded over, as the tower no longer functions as a manned mechanized interlocking control tower.

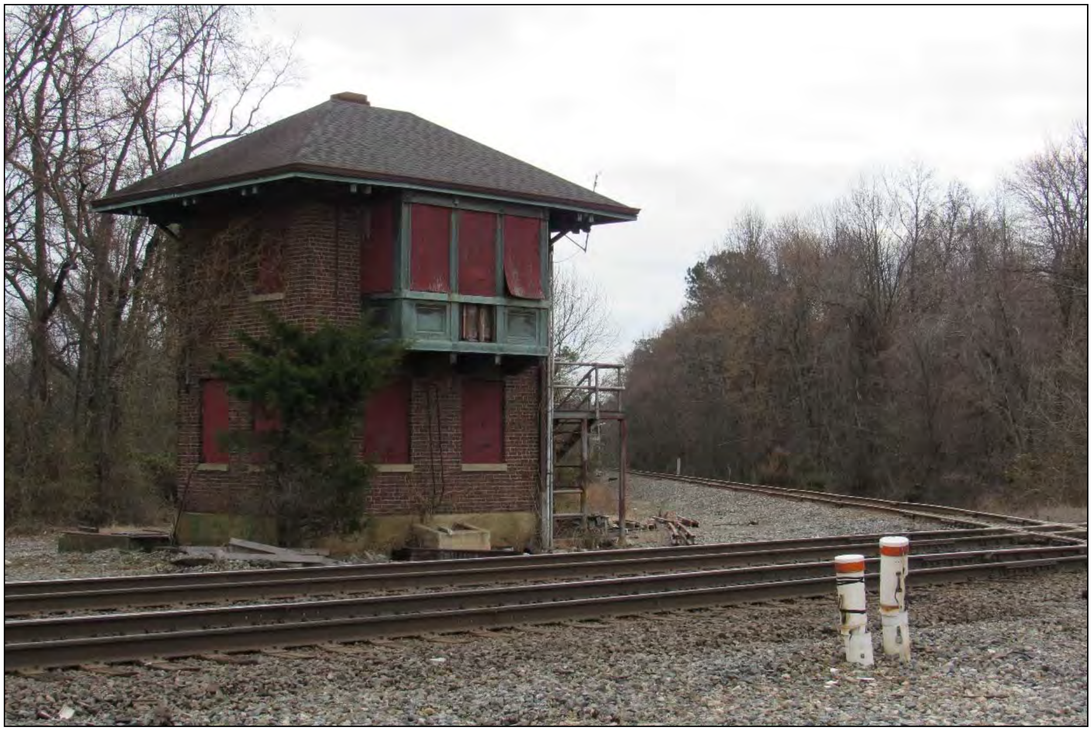

FIGURE 3-204: VIEW OF HN TOWER AND RAILROAD, LOOKING SOUTHEAST

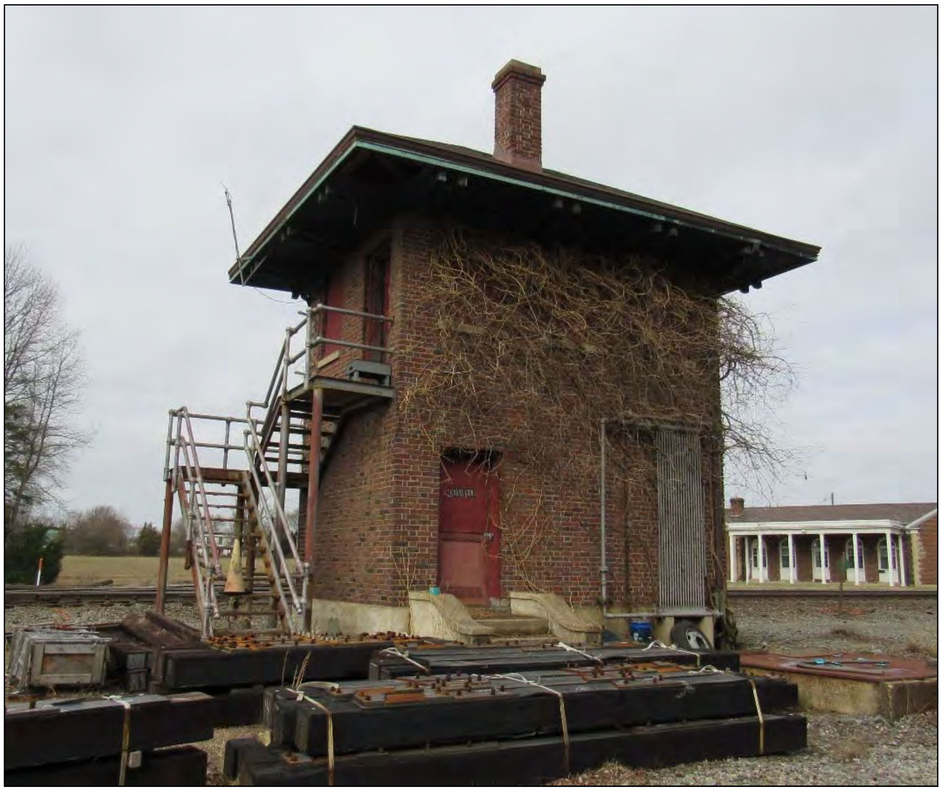

FIGURE 3-205: SOUTHEAST OBLIQUE OF THE HN TOWER

3.16.3 NRHP Evaluation

The Doswell Depot and Tower (historically known as the C&O/RF&P Station and HN Tower) located at 10577 Doswell Road is currently used as the offices of the Buckingham Branch of CSXT. Constructed after a circa-1907 station burned at this location in 1927, the current depot remains in use for rail-related activities. The Doswell Depot was important to the community of Doswell, and it follows trends of small depots being built to spur the development of many other railroad towns along the RF&P Railroad, such as the Woodford Depot (016-0222), which was built circa 1900 as a joint freight and passenger depot to serve the community of Woodford, and the NRHP-listed Beaverdam Depot (042-0081), a depot built in 1866 to replace another depot destroyed during the Civil War. The railroad and Doswell Depot prompted commercial, industrial, and residential growth in the crossroads community and the depot remains the most prominent surviving symbol of the importance of rail travel to the development of Doswell. As such, the Doswell Depot and Tower are recommended eligible for the NRHP under Criterion A for its significant associations with transportation and development in Doswell at the local level.

The Doswell Depot and Tower have no known association with an individual who is "significant within a historic context" or has "gained importance within his or her group or profession"—necessary qualifications for it to be eligible under Criterion B. Therefore, the resource is recommended not eligible under Criterion B.

Although its architect is unknown at this time, this building remains a good example of a Classical Revival railroad station and reflects the continued investment that both the C&O Railroad and RF&P Railroad made in the community of Doswell. When combined with its circa-1928 HN tower, these two resources are an increasingly uncommon site along historic rail lines in the state. Although some, but not all, windows have been replaced in the building, this is the only notable modification to the exterior of the depot. As such, the resource overwhelmingly retains historic integrity of location, design, materials, workmanship, setting, feeling and association. Given its good condition, continued use, and relatively high level of historic integrity, this resource merits individual listing in the NRHP under Criterion C for architecture at the local level.

As an architectural resource, the Doswell Depot and Tower have not been evaluated under Criterion D.

This resource is located within the Doswell Historic District (042-5448). The Doswell Depot and Tower were built during the district's period of significance and contribute to the historic integrity and architectural significance of the district as a whole. As such, it should be considered as a contributing resource to the district.

The Doswell Depot and Tower should also be considered as contributing to the RF&P Railroad Historic District (500-0001). They were built during the district's period of significance and were built by the RF&P Railroad to serve the small community of Doswell. As such, the Doswell Depot and Tower should be considered as contributing resources to the railroad historic district.

In sum, **the Doswell Depot and Tower is recommended eligible for listing in the NRHP under Criteria A and C, and considered a contributing element to the Doswell Historic District and the RF&P Railroad Historic District.**

The proposed period of significance for this resource is from 1927 to 1958, the date the resource was built until the date the tower stopped being used and the depot was primarily retired from passenger service. The proposed NRHP boundaries for the Doswell Depot and Tower, as determined during the current investigations, encircle both resources individually (Figure 3-206). The boundary for the depot encircles the building closely and does not include any landscape features. The tower boundary is located within the railroad right-of-way and includes the graveled area surrounding the resource.

3.17 ROBERT STILES BUILDING/ MAIN BUILDING OF THE LAUREL INDUSTRIAL SCHOOL (043-0292-0001)

The Robert Stiles Building, also known as Main Building of the Laurel Industrial School, is located at 2900 Hungary Road in Henrico County, Virginia. The building is situated in the northern portion of the NRHP-eligible Laurel Industrial School Historic District (043-0292) boundaries. The building sits upon a 0.89-acre parcel on the northeast corner of the intersection of Hungary and Hungary Spring Roads, approximately 0.8 mile from the existing railroad bed (Figure 3-207). It is situated in the center of the property, setback from both roads, and immediately surrounded by a manicured grass lawn to the south while gravel parking areas line the north and west. Another parking area is located on the east side separated from the building by a small strip of manicured grass. The property is accessed by two vehicular entrances: one from Hungary Spring Road in the northwest corner of the lot and another from Hungary Road in the southeast corner. Some deciduous trees and shrubbery line the north and east boundaries of the parcel. Immediately north of the property is a Henrico County school, to the east are several small parcels filled with residential or former residential buildings as well as the existing railroad bed, while Hungary Road is situated immediately south as well as other residential and commercial properties, and a large townhouse and condominium community and Hungary Spring Road are to the west.

3.17.1 Historic Context

In May 1890, the Prison Association of Virginia (Prison Association), a group organized from local citizens incorporated by the General Assembly in March 1890, received a plot of land containing approximately 17 acres near Laurel Station in Henrico County as a gift from Annie P. Russell of Richmond (Henrico County Deed Book [HCDB] 130-A:321–322; Keve 1986). Eventually, the association accumulated about 90 acres in the Laurel area (Figure 3-208) (Manarin and Peple 2011). Soon after, in 1892, the Prison Association purchased multiple tracts of land on the west side of the RF&P Railroad along Hungary Road from the Special Commissioners representing the deceased W. L. Cowardin (HCDB143-A:277–278, 278–279).

The Prison Association sought to reform the state's penal system for Virginia's juvenile offenders (Keve 1986; Leach 1984). Beginning around 1860, about a dozen states had built "reform schools" as separate institutions for felonious and delinquent children while the Commonwealth continued to use the penitentiary (Keve 1986:149). Alternatively, development of juvenile institutions were left to voluntary groups and private organizations such as the Prison Association of Virginia (Keve 1986:149). The goal of these associations:

> …shall be the improvement of the government, discipline, and general management of prisons within this state, whether under the control of state, city, or county authorities; the amelioration of the condition of prisoners, whether detained as witnesses or for trial or finally convicted; and the encouragement and aid of discharged convicts who exhibit any desire to reform and to become good citizens [Keve 1986:152].

FIGURE 3-208: PRISON ASSOCIATION PROPERTY WITH ROBERT STILES BUILDING AS RECORDED IN 1915 (HENRICO COUTY PLAT BOOK [HCPB] 11:216) (MAP NOT TO SCALE)

The program at the industrial school was intended to provide white boys with basic education as well as vocational skills. The purchase and donation of the large plot of land in Henrico County was the first step in making the vision of the Prison Association a reality to build a reform campus. The main building, called the Robert Stiles Building after the founder of the association, was the first in the Laurel Industrial School complex constructed around 1894; its construction was funded through state appropriations (Leach 1984). The building served as a dormitory, chapel, dining hall, and school of the convicted white boys. Farm work as well as a vocational instruction program was favored by the institution, and the Prison Association sought after manufacturing contracts for a means of financial support, their first being with the company of J.J. Wright and Stokes manufacturing horse collars (Prison Association of Virginia 1898:4). However, this contract was terminated just one year later due to the company failing to pay the Prison Association. The school also operated a blacksmith shop, broom-making operation, and a garment factory at various times with the incarcerated boys acting as the workforce.

Although the association intended to operate under paternal and protective philosophies unlike those used in penitentiaries, their practices were considered harsh and outdated after the board president attended a conference with other juvenile institution operators in 1902 (Keve 1986). For example, the Prison Association still favored the use of a ball and chain as a method of punishment and complete silence during meal and work times. After multiple complaints that the Commonwealth was not supporting the school and that board members were overreaching in their positions, the governor requested an investigation from the Virginia Board of Charities and Corrections in the 1910s (Keve 1986). From this investigation, it was proposed that "the Laurel Industrial School is in sore need of larger support from the State… We, therefore, strongly recommend, as a great duty and obligation on part of the State, that State ownership shall be effected as soon as possible" (Keve 1986:156). During this transition period, it was recognized that the area was becoming more and more urbanized as the City of Richmond, just 8 miles south, expanded, and a search for a new location with ample farmland began. A new site was found on the south side of the James River in Powhatan County. In February 1920, the General Assembly of Virginia approved the dissolution of the Prison Association, and its property as well as the buildings thereon were sold to the Commonwealth (HCDB 215-B:69).

In September 1924, Albert Anderson Harvey purchased several lots from the state for $48,000, including 93.83 acres on the north side of Hungary Road which included the Industrial School's buildings (HCDB 230-C:209–212). Harvey operated a general store, called Harvey's Store, in the main building, all the while accumulating several more properties around Laurel Station including what is now the Laurel Gallery on the south side of Hungary Road (Henrico County Will Book [HCWB] 13:400). During his ownership, Harvey sold off a portion of the land to the north to the Henrico County School Board. In 1941, Harvey willed that his associate, Robert Alexander Walton, and his son-in-law, Claude Linwood Bradshaw, could purchase the property after his death for $6,000 (HCDB 290:357–360; HCWB 13:400). After Harvey's death in 1941, his land was subdivided (Figure 3-209) (HCDB 29:356). Both Walton and Bradshaw willed their shares of the property and their business, Laurel Links, Inc., to their wives, Rebecca Briggs Walton and Elise Harvey Bradshaw, respectively (HCWB 26:343–344, 38:423).

FIGURE 3-209: PLAT OF SUBDIVISION OF ALBERT ANDERSON HARVEY'S LAND IN 1930, PARCEL BOUNDARIES STILL EXISTING TODAY (HCDB 290:356)

Rebecca Walton and Elise Harvey conveyed the property, along with two others in the vicinity, to Kent Newcomb and his wife, Helen, in 1968 for a total of $27,000, who then sold it to Dartman Corporation in 1969 (HCDB 1367:401–403, 1394:154–156). In 1976, Stonewall Enterprises, Inc. assumed the Dartman Corporation which included the properties they owned (HCDB 1689:152–153). The school building was then sold to Knob Enterprises, with one-half undivided interest going to each owner of the company: Walter Proffit and Stewart Vest (HCDB 1758:1229–1232). The mortgage was defaulted on and, in 1982, the Heritage Savings and Loan Association sold the property to Robert Bluford, Jr. and his wife, June (HCDB 1787:544–547, 1873:1453). The Blufords, assisted by area residents, are responsible for nominating the Laurel Industrial School as a historic district to the NRHP in 1987 (Wright 2012). They conveyed the property to their son, Robert Bluford, III, in 1991, who continues to own the building today. The building currently houses multiple leasable office spaces.

3.17.2 Architectural Description

3.17.2.1 Primary Resource Exterior

Originally constructed as a multi-purpose building for a boys reformatory school around 1894, this Romanesque Revival-styled, two-and-one-half-story, seven-bay, brick building has a rectangular plan with a slight entrance projection centered on the east elevation (Figure 3-210). The current primary elevation faces east towards private properties and the railroad (Figures 3-211 through 3-213). The building is set on a continuous, raised basement foundation which supports a structural system composed of brick laid in a six-to-one, common bond. The building features a brick, corbelled belt course as well as soldier-coursed water table. A low-pitched hipped roof with multiple cross gables is sheathed in slate shingles and lined with a wood cornice and boxed gutters currently clad in metal. The gabled ends feature prominent partial returns accented by brick squared pilasters extending down to the belt course featuring corbelled capitals. The roof's ridge is pierced with six metal flues that appear to be fairly evenly spaced. Two interior-end brick chimneys with corbeled caps are located on both the north and south elevations. Six interior-end brick chimneys with corbeled caps are located along the east and west elevations, making for a total of 16 chimney stacks, some of which are larger than others.

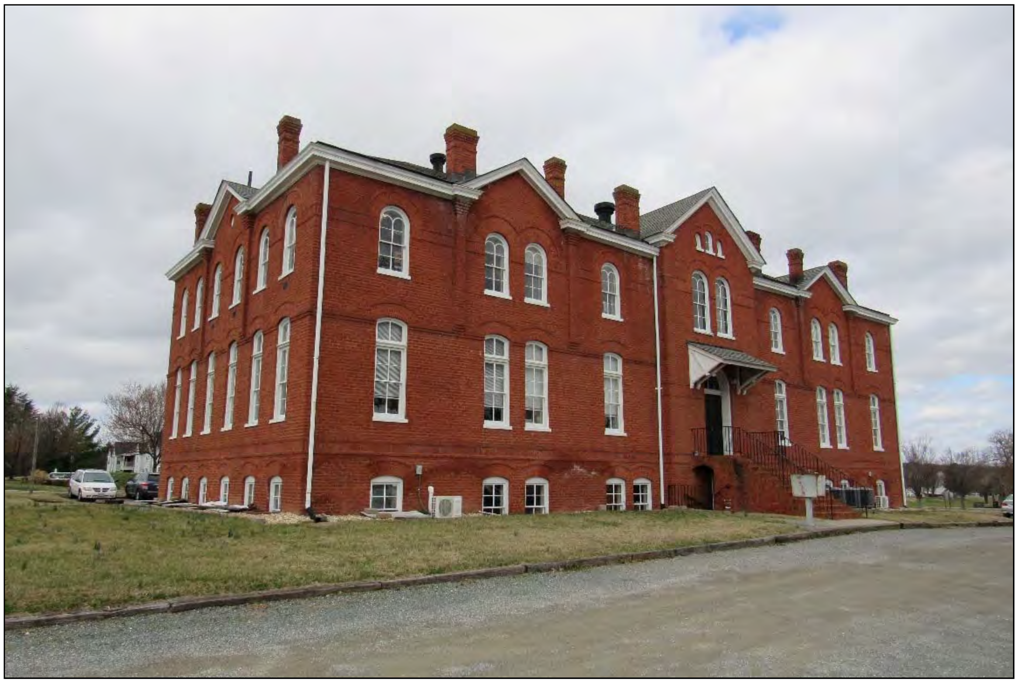

FIGURE 3-211: SOUTHEAST OBLIQUE OF ROBERT STILES BUILDING

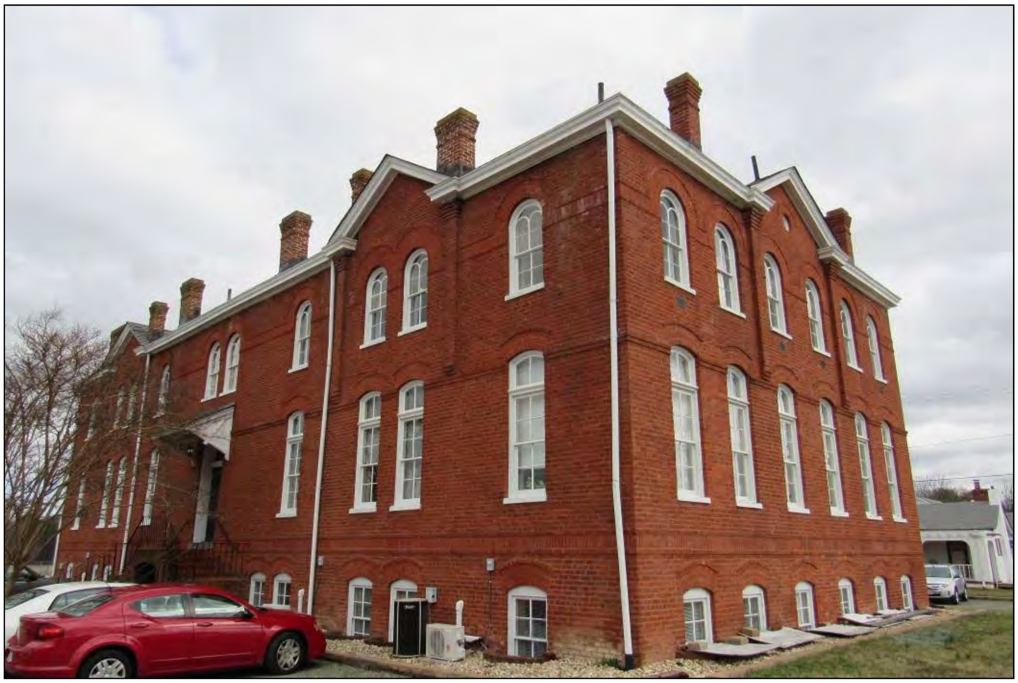

FIGURE 3-212: SOUTHWEST OBLIQUE OF ROBERT STILES BUILDING

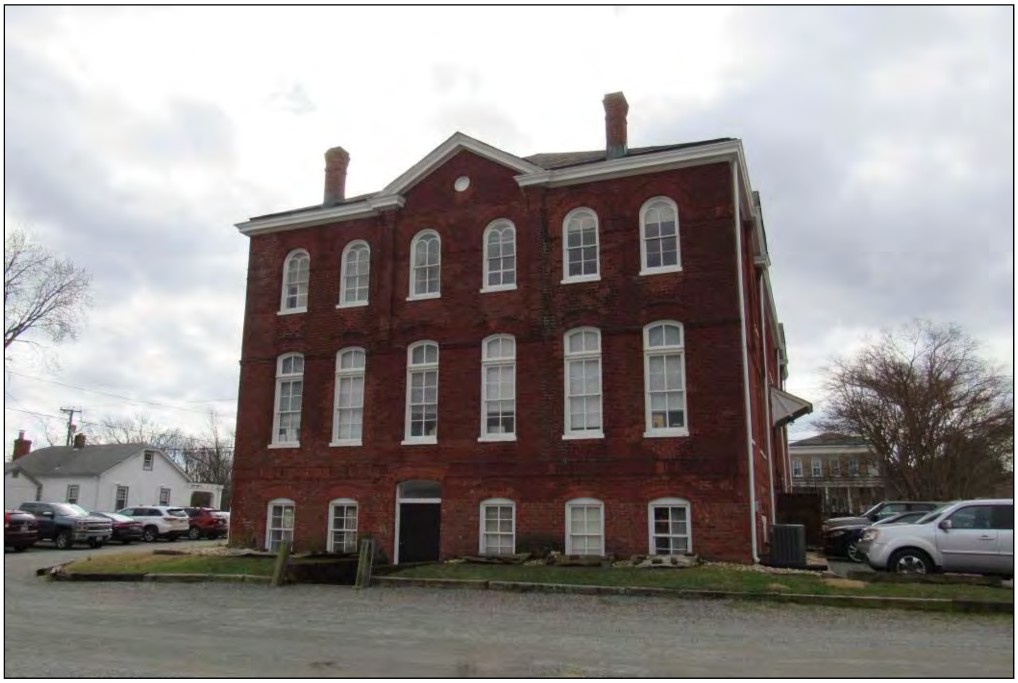

FIGURE 3-213: NORTH ELEVATION OF ROBERT STILES BUILDING

The building's primary entrance is situated in the center of the east elevation, beneath the central gable, with a similar entrance mirrored on the west (Figure 3-214). They are both filled with replacement, double-leaf, paneled doors featuring an eight-light, arched, wood transom. The eastern entrance is accessed by a raised brick stoop lined with a metal railing and is covered by a pent roof supported by wood brackets and sheathed in slate shingles. An arched opening on the south side of the stoop provides direct access to a basement-level entrance that is filled with a single-leaf, metal door. The western entrance also has a brick stoop with a shed overhang; however, a set of stairs extends north and south from the stoop providing a central (western), arched access to a basement-level entrance. This entrance features a double-leaf, half-glazed, metal door. An additional basement-level entrance is off-centered in the north elevation and is filled with a single-leaf, metal door with a single-light wood transom above. A poured-concrete walkway lined by brick retaining walls provides access to the northern basement entrance.

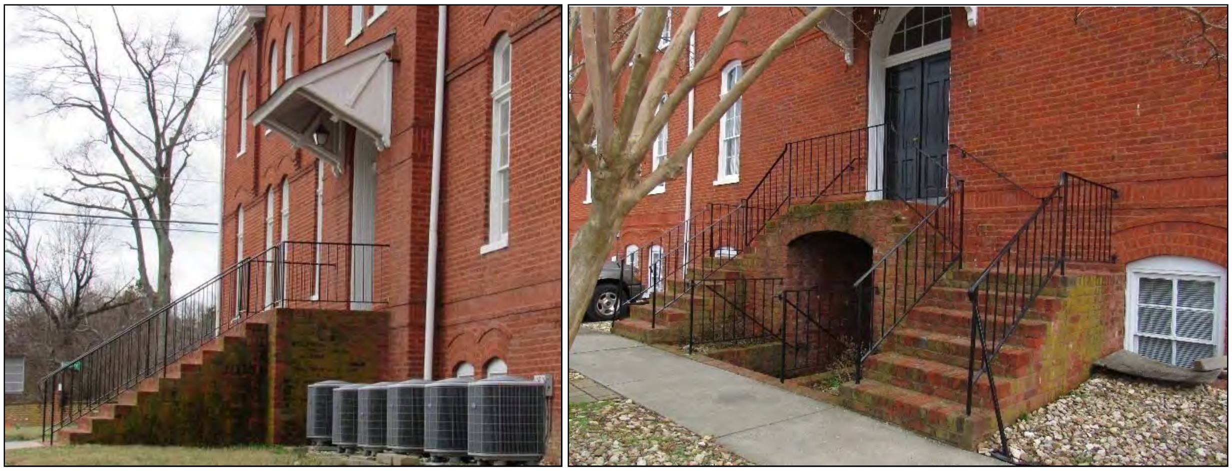

FIGURE 3-214: EAST ENTRANCE, LOOKING SOUTH (LEFT); WEST ENTRANCE, LOOKING NORTHEAST (RIGHT)

The building contains a variety of fenestration, all detailed with segmental and arched openings—a hallmark of the Romanesque Revival style (Figure 3-215) (McAlester 2015:387–394). The second story includes single and paired, Venetian-style windows with five-over-four, wood-frame, double-hung sashes and wood sills. The first story features single and paired, four-over-four, wood-frame, double-hung-sash windows with a segmental arch, two-light, transom above and wood sills below. Windows in the basement-level include four-over-four, wood-frame, double-hung-sash windows set within segmental arch openings. All of the window arches are composed of brick headers with wood sills below. At the first and second floors, the decorative brickwork of each arch is connected by a belt course that wraps around the entire building. A set of three two-light, wood-frame, arched, possible casement windows are located in the central gable of the east elevation; they also feature brick arches and wood sills. Two circular, boarded up openings are centered within the gables in the north and south elevations; they are encircled by brick headers.

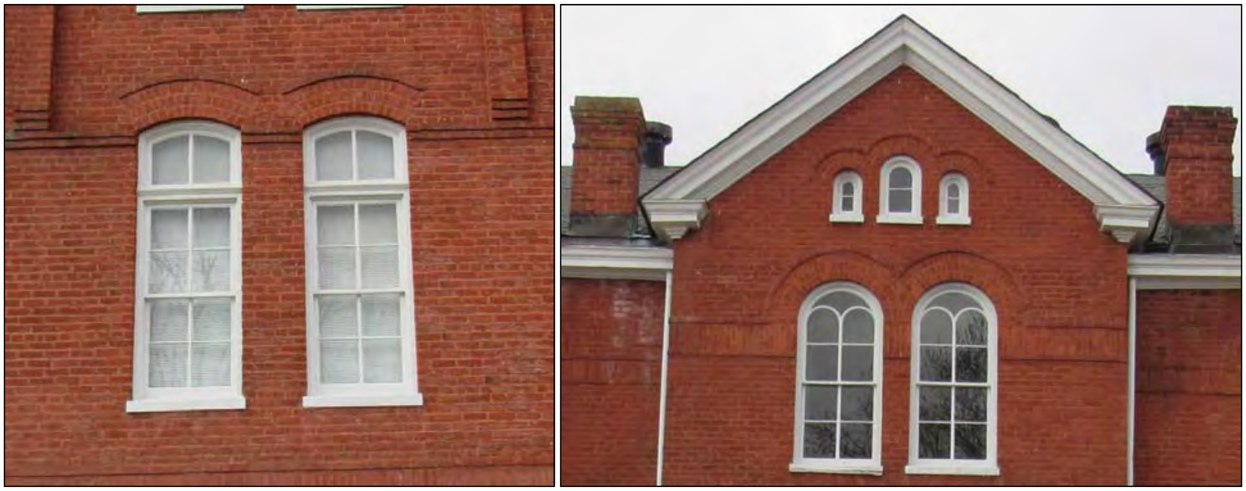

FIGURE 3-215: FIRST STORY WINDOW DETAIL, EAST ELEVATION (LEFT); SECOND STORY AND GABLED WINDOW DETAIL, EAST ELEVATION (RIGHT)

3.17.2.2 Primary Resource Interior

Although full access to the interior of the building was not obtained, surveyors did access shared spaces at each floor, noting that the first story, second story, and basement level mirror each other in a central-hall plan (Figures 3-216 and 3-217). The primary entrance in the east elevation opens to a hall that features wood flooring and drywall-covered walls, similar to the second story, while the basement level contains laminate tiled floors.

An entrance in the west wall of the first story hall mirrors the east entrance. A center beam that crosses from north to south in the first story hall is supported by cast iron supports with understated decorative detailing (Figure 3-216). In the southwest quadrant of the hall is a single stretch of wood stairs leading to the second story. This staircase is lined with a turned wood balustrade with paired spindles and a turned newel capped with a simple finial. A total of four doorways framed by simple wood surrounds, all filled with replacement metal, paneled doors, are located in both the north and south walls of the first story hall; they all lead to occupied office spaces. The second story and basement level halls also feature this same door pattern. A large chandelier is situated in the east half of the hall of the first and second stories.

A staircase covered in carpeting and lined with a similar balustrade is set beneath the stair leading to the second story and is accessed from the east in the first story hall. The carpeted staircase leads to the basement level. The basement hall features an exterior entrance in the west wall and is filled with double-leaf, metal, multi-light doors. The east wall of the basement hall contains a single-leaf, paneled, metal door to an unknown space. This area is also accessed via the exterior by a single-leaf door.

3.17.3 NRHP Evaluation

The Robert Stiles Building or Main Building of the Laurel Industrial School, now an office building called Bluford Office Building, at 2009 Hungary Road is a Romanesque-Revival-styled educational building commissioned by the Prison Association of Virginia and completed around 1894. Although the building has experienced some modifications to the interior, it continues to retain a high level of integrity in design, location, materials, and workmanship. The area in which the resource is located has moderately changed from its primarily rural setting during its period of significance (1894–1920) to current suburbia, yet the primary building associated with the Laurel Industrial School Historic District (042-0292) and the small railroad town of Laurel still endure.

The Robert Stiles Building was constructed as the primary building of the Prison Association of Virginia's Laurel Industrial School, a turn-of-the-century reformatory school for convicted white boys. The school stemmed out of a period of recognition that incarcerated juveniles should not be housed with adult criminals, but instead given the opportunity to learn practical and technical skills for their life after release. Being one of the only surviving examples of this important period of prison reform, the resource is recommended as eligible under Criterion A at the state level.

Although the Prison Association of Virginia and its members played an important role in the establishment of the school and continuing the changes stemming from the prison reform movement in Virginia, they were not known to be catalysts or particular leaders. Therefore, the resource is recommended not eligible under Criterion B.

The resource is an exemplary example of the Romanesque Revival architectural style with extensive brick detailing, such as arched window openings, pilasters, and belt courses. It is unique in Henrico County as well as in public and educational buildings throughout this area of Virginia. Although continued and altered use of the building has encouraged some moderate change and replacement throughout the interior of the building, the resource is recommended as eligible under Criterion C at the local and regional level. As an architectural resource, the Robert Stiles Building was not evaluated under Criterion D

In sum, the Robert Stiles Building is **recommended eligible at the state level under Criterion A and at the local level under Criterion C.** As the resource was constructed during the district's period of significance and is the first building constructed as a part of the Laurel Industrial School, the resource is **recommended to remain a contributing resource to Laurel Industrial School Historic District (043-0292).**

The resource is recommended to have a period of significance beginning in 1894, when the school building was constructed, to 1920, the time in which the school was in operation. The proposed NRHP boundaries for the resource is limited to the current Henrico County tax parcel boundaries (GPIN 769-759-7739) (Figure 3-218).

3.18 RF&P PAINT SHOP (043-5636)

The RF&P Paint Shop, currently owned by the Integrated Power Sources of Virginia, is located at 2260 Dabney Road in Henrico County, approximately 0.5 miles north of Richmond (Figure 3-219). The resource was once a part of a complex of warehouses and shops related to CSXT's Acca Yard, immediately east of the building. The area has been moderately altered with new construction; however, it still remains primarily commercial and industrial in nature. Currently, the RF&P Paint Shop sits on a 0.53-acre parcel and is immediately surrounded by an asphalt parking area to the northeast and manicured grass to the northwest, southwest, and southeast. The building is lined with deciduous trees along the southeast elevation. The property is accessed by a paved driveway extending southwest from Dabney Road by an asphalt parking area where two railroad tracks once extended from the Acca Terminal Yard east to the paint shop, according to historic aerials (NETR 1952, 1994). Remnants of these tracks are still visible today.

3.18.1 Historic Context

The resource, known as the RF&P Paint Shop, is located on the west side of Dabney Road, west of the current railroad. The RF&P Railroad Company purchased approximately 60 acres of land lying near Acca Yard in 1904 from Edwin A. Palmer, trustee for his wife, Alice H. Palmer (HCDB 170-A:331–332). The RF&P Paint Shop was among several buildings, including warehouses, shops, and a roundhouse and turntable, opened in 1924 as a part of a locomotive terminal and complex known as the Acca Locomotive Terminal, sometimes referred to as Acca Engine Terminal. As part of the larger Acca Yard, the facility served as the Richmond engine terminal for services and maintenance for locomotives belonging to both the RF&P Railroad and the Atlantic Coast Line Railroad (ACL) (Griffin 1994:11, 19). Henrico County's Real Estate Assessment Division documents the paint shop as being constructed around 1940, and historic topographic maps support this information; however, a photo of the yard believed to be taken in the 1930s shows the paint shop building in the background (Figure 3-220) (USGS 1939, 1956). As such, it is believed that the paint shop was actually constructed as part of the Acca complex in 1924.

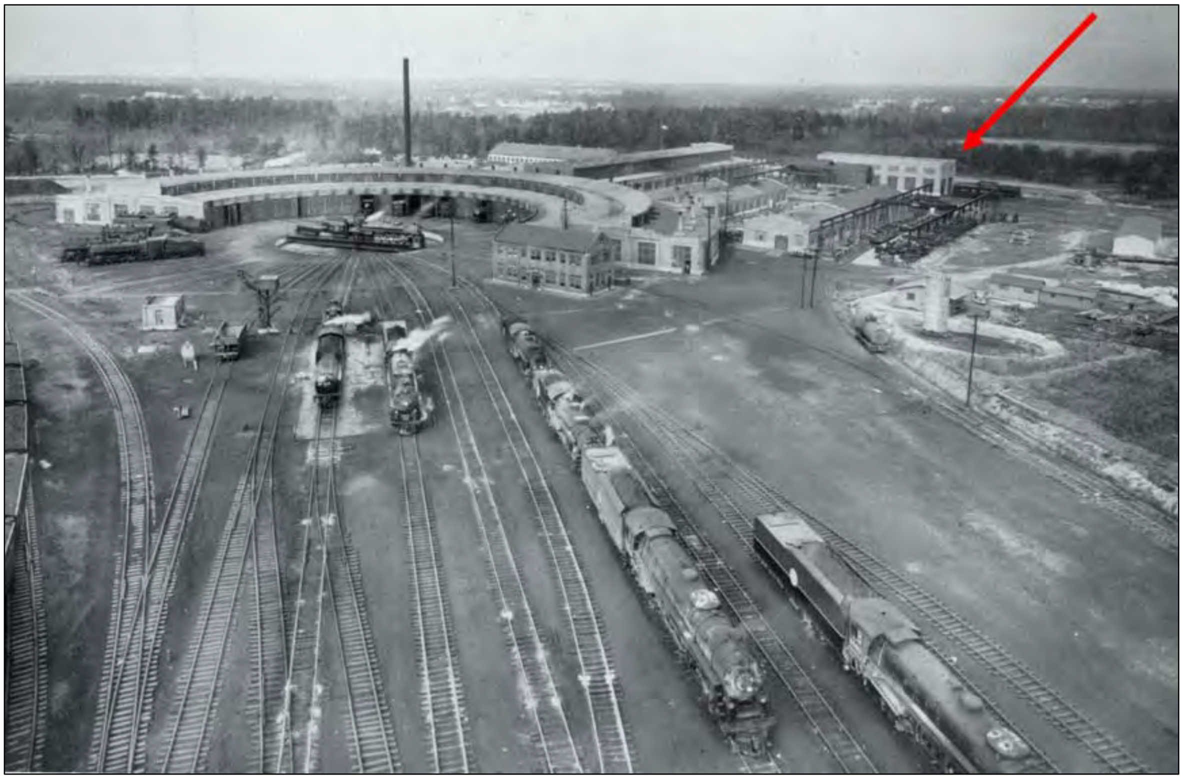

FIGURE 3-220: LOOKING WEST ONTO THE ROUNDHOUSE AND TURNTABLE OF ACCA LOCOMOTIVE TERMINAL BELIEVED TO BE TAKEN CIRCA 1930 (GRIFFIN 1994:19). VISIBLE IN THE BACKGROUND IS THE RF&P PAINT SHOP (DENOTED BY RED ARROW).

In the 1960s, RF&P Railroad Company opened a new consolidated shop facility in Richmond known as Bryan Park Terminal immediately northeast of the Acca Locomotive Terminal and the paint shop. This new shop, which housed the company's mechanical, engineering, and purchasing and stores departments, made some buildings at the Acca Locomotive Terminal obsolete (Griffin 1994:20). In the late 1960s, the coal filling station's roundhouse, turntable, and several warehouses were demolished, and by the mid-1970s, after another expansion at Bryan Park, new buildings were constructed in their place (Figures 3-221 and 3-222) (NETR 1952, 1968; 1977; Griffin 1994:). The RF&P Paint Shop is one of only two buildings that remain from the Acca Locomotive Terminal of the Acca Yard.

The RF&P Railroad Company continued to own and operate the Acca Locomotive Terminal under several different companies and corporations until 1991 when the rail line was merged with CSXT (Griffin 1994:18; HCDB 618:226–228, 1653:741, 2161:967; 2313:713). After the Acca Terminal closed in 1998, the 0.53-acre Paint Shop property, among other buildings in the area, was transferred to the Commonwealth Atlantic Properties, Inc., a Virginia corporation, successor by name change to Richmond, Fredericksburg, and Potomac Corporation (RF&P Corporation) which was successor to RF&P Railroad Company (Figure 3-223) (HCDB 2313:713, 2770:2578, 2711:1274, 2770:2589–2607). Commonwealth Atlantic Properties, Inc. conveyed the property to Linwood S. Raikes in 1999 (HCDB 2270:2589–2607, 2934:1853). In 2000, the Paint Shop building and 0.53 acre was sold to SRS Investments, LLC for $285,000 (HCDB 3036:692, 3050:1672). Today, the building houses the Integrated Power Sources of Virginia, a company focused on a multitude of power systems including stationary, motive, and solar.

3.18.2 Architectural Description

3.18.2.1 Primary Resource Exterior

The resource is a one-story, two-bay commercial building with a rectangular plan with elements of the Art Deco and Moderne architectural styles (Figures 3-224 and 3-225). It is built on a poured-concrete foundation and is constructed of brick laid in a five-to-one common bond with low-relief corbeling framing fenestration, often seen in Art Deco/Moderne buildings (Figure 3-226) (McAlester 2015). Similar to many commercial buildings of the period, the former paint shop is covered by a very low-pitched, front-gabled roof, featuring a stepped parapet with a concrete cap on the primary (northeast) and rear (southwest) elevations. In the center of the northeast parapet are large metal numbers reading "2260." Iron anchor plates are also visible in those elevations. Current online aerials indicate that the roof has been lined with multiple solar panels.

FIGURE 3-224: SITE PLAN OF THE RF&P PAINT SHOP (043-5636)

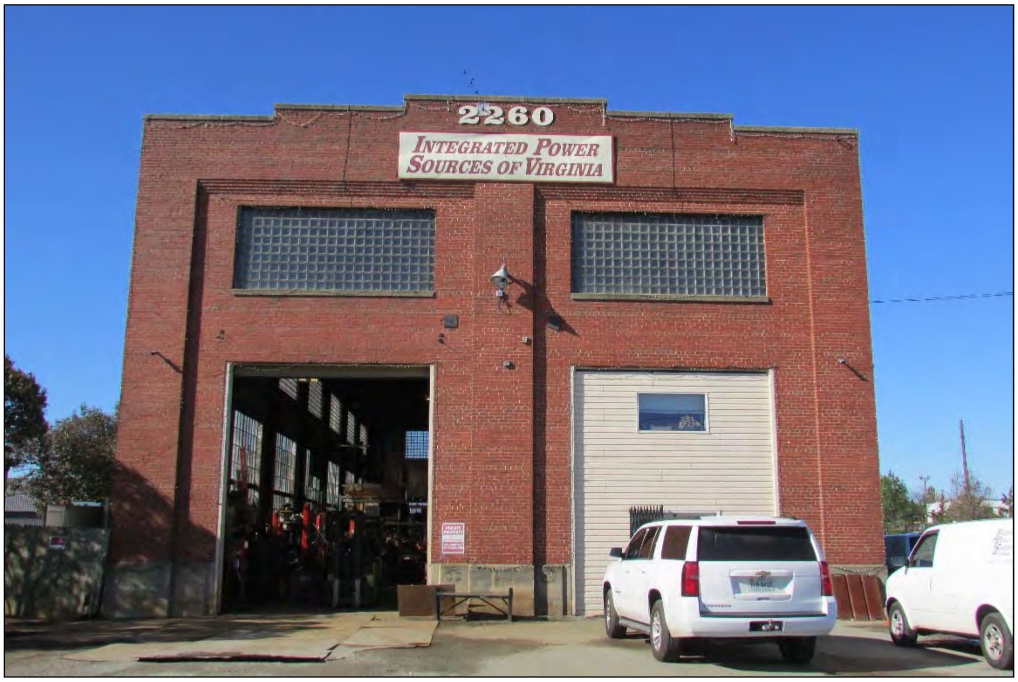

FIGURE 3-225: NORTHEAST ELEVATION OF RF&P PAINT SHOP

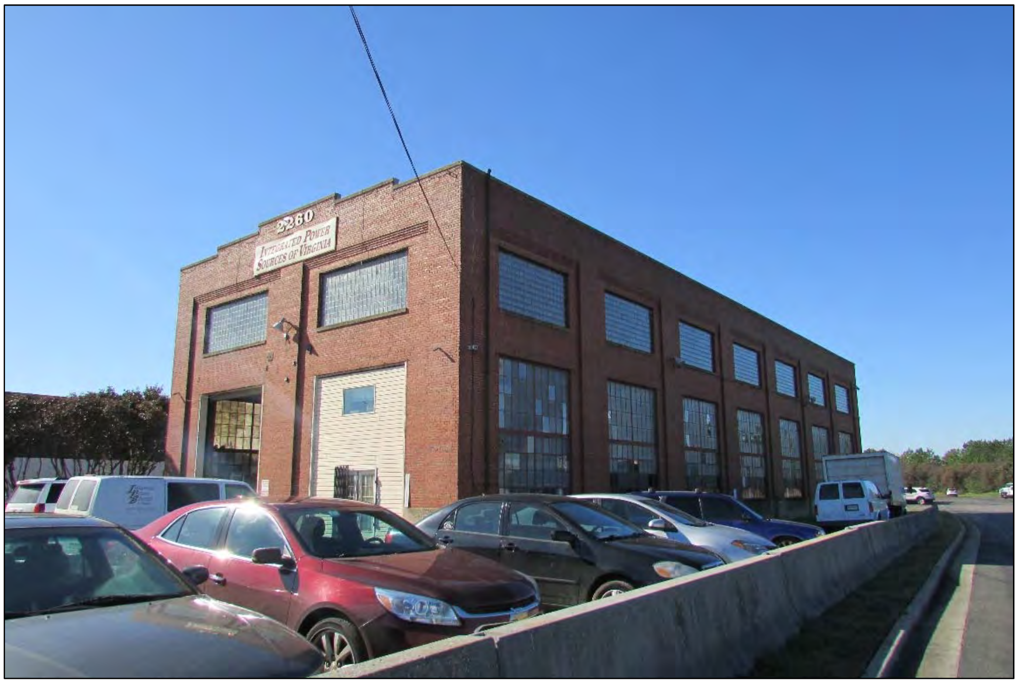

FIGURE 3-226: NORTH OBLIQUE OF THE RF&P PAINT SHOP

The northeast elevation features two large garage bays. The southern bay is filled with a metal, segmental, overhead garage door while the northern has been filled with vinyl siding and retrofitted to feature a single-leaf door. The southwest elevation mirrors the northeast elevation; however, each garage bay is filled with a wood, paneled, tilt-up garage door with multiple lights and an inset single-leaf pedestrian door (Figure 3-227). Each door has been retrofitted with a large ventilation unit, most likely leftover from the former use of the building. A square concrete slab protrudes southwest from the center of the southwest elevation between the two garage bays. Additional fenestration includes a combination of multi-light, fixed, metal windows with a central, 10-light, awning sash and rectangular groupings of fixed glass blocks (Figure 3-227). All windows feature a reinforced-concrete sill. Defunct lines of track lead from the parking area into the two bays on the northeast elevation.

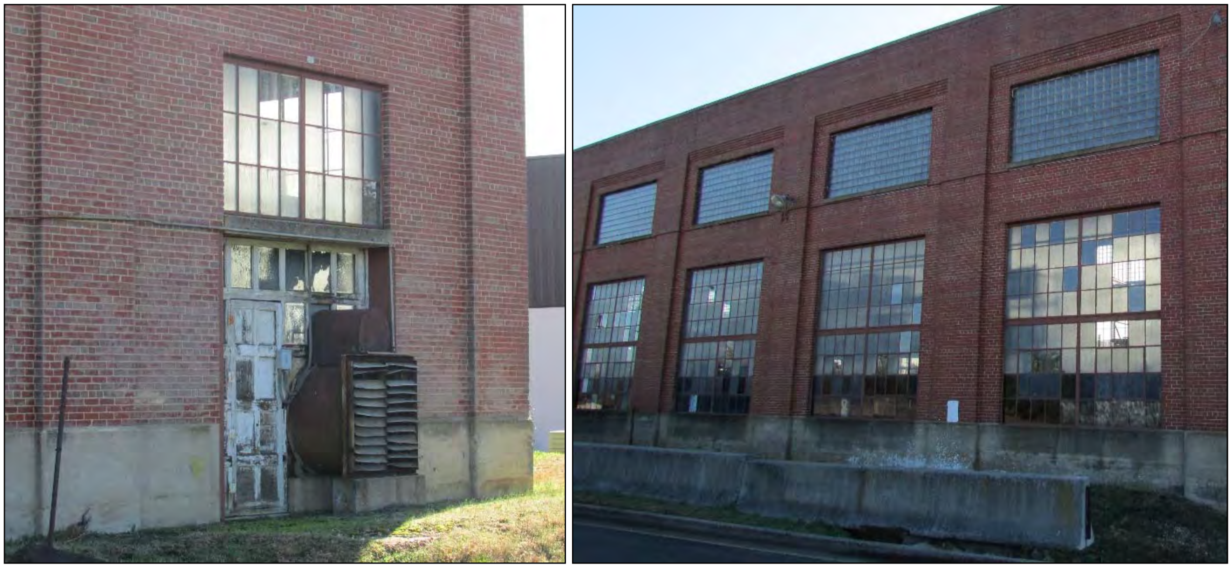

FIGURE 3-227: DETAIL OF GARAGE BAY WITH INSET PEDESTRIAN DOOR, SOUTHWEST ELEVATION (LEFT); DETAIL OF WINDOWS, NORTHWEST ELEVATION (RIGHT)

3.18.2.2 Primary Resource Interior

The interior of the building is predominantly left open with exposed brick walls, exposed metal Pratt truss system, and a poured-concrete floor with remnants of the defunct tracks leading from the northeast to the southwest where the garage bay doors mirror one another (Figures 3-228 and 3-229). Also visible in the concrete floor are various steel rectangles that are set in between each track line and a rectangular man-hole cover, providing access to work spaces below. Lining the northwest and southeast walls are various metal shelves while a two-story, office space build-out is set in the north corner of the building (Figure 3-230). It is accessed by two single-leaf, metal doors, one located in the southeast wall and the other in the southwest wall. A set of wood steps lines the southwest wall of the buildout to provide access to the single-leaf, metal door to the second level. One-over-one, vinyl, double-hung sash windows are situated in the southeast and southwest walls of the buildout.

3.18.3 NRHP Evaluation

The RF&P Paint Shop building, now an office and warehouse building for the Integrated Power Services of Virginia, at 2260 Dabney Road is a warehouse building with Art Deco/ Moderne characteristics constructed circa 1924 located in Henrico County, immediately northwest of the city limits of Richmond. The resource does not appear to have undergone any notable physical changes nor has it been moved from its original location; therefore, it retains a high level of location, design, materials, and workmanship. The resource was constructed as a part of the Acca Yard Terminal for the RF&P Railroad, a yard used for the maintenance of locomotives in the early-twentieth century. By the mid-1970s, most of the buildings and structures that were a part of the yard were demolished save for a warehouse and the paint shop. The surrounding area is now a contemporary industrial park. The resource is also no longer owned and used by the railroad, and tracks that once led to the building have now been covered by paved asphalt or vegetation. For these reasons, the resource retains a low to moderate level of setting, feeling, and association.

The RF&P Paint Shop is one of two remaining buildings associated with the once bustling terminal of the Acca Yard. Similar to Potomac Yard, north of Alexandria along the RF&P Railroad, changing needs and technologies required less of such locomotive terminals and left the areas open to new construction which has significantly altered the surroundings of the RF&P Paint Shop. Although this building once played a role in the maintenance of locomotives for the ACL and RF&P Railroad companies that operated the Acca Yard and contributed to the region’s transportation in the mid- to late-twentieth century, it no longer functions for that purpose and it has been slightly modified for new uses diminishing its historic integrity. The remainder of Acca Yard has also been demolished save for one building located immediately west of the paint shop. Therefore, it is recommended not eligible for listing under Criterion A.

Archival research did not yield any information about important individuals associated with this resource; and therefore, it is recommended not eligible under Criterion B.

Criterion C, as outlined by NPS, pertains to "properties significant for their physical design or construction, including such elements as architecture, landscape architecture, engineering, and artwork" (McLelland et al. 1999). For a resource to be eligible for the NRHP under Criterion C, it must "embody distinctive characteristics of a type, period, or method of construction, represent the work of a master, possess high artistic value, or represent a significant and distinguishable entity whose components may lack individual distinction" (Shrimpton et al. 1990). The resource is not considered an outstanding example of this particular architectural style, nor is it known to be the work of a master. Stronger examples of the Art Deco/ Moderne style have been documented in the surrounding area, particularly in Richmond such as the Byrd Theatre (127-0287), the Baker Public School (127-0877), and the Henrico Theatre (043-0287) in Henrico County. The building is also not known to be an exceptional example of this property type as alterations to the interior, including the two-story office space and in-filling of one of its large garage bays, has diminished its historic function and original appearance. For these reasons, it is recommended as not eligible under Criterion C.

As an architectural resource, the RF&P Paint Shop was not evaluated under Criterion D.

In sum, the RF&P Paint Shop is **recommended as not eligible for listing in the NRHP under Criteria A–C**.

3.19 WINFREE COTTAGE (127-6129)

The dwelling known as Winfree Cottage is located immediately southeast of Interstate 95 in Richmond, Virginia (Figure 3-231). The resource is currently located in the parking lot of the Seaboard Air Line Freight Depot (127-0292), directly north of the depot and southwest of the Lumpkin's Jail Site (44HE1053). The existing railroad bed is situated southeast of the resource. A small, densely wooded area runs along the northwestern boundary of the resource, where a large retaining wall for I-95 runs northeast to southwest. The primary elevation faces southeast towards the open parking lot.

Figure 3-231
Location of Winfree Cottage (127-6129)

03/2018

3.19.1 Historic Context

The resource known as the Winfree Cottage is named for the dwelling's earliest known owner, Emily Winfree, a formerly enslaved woman (Figure 3-232). Emily Winfree was born in 1834 in Chesterfield County. It is believed that she was owned and enslaved by David C. Winfree until she was freed either by David or following the Civil War and the Emancipation Proclamation (Kollatz, Jr. 2013). It is also hypothesized that David was the father of some or all of Emily's children—even those born after she moved to Manchester; although there is little primary source evidence to corroborate this, the marriage certificate of her youngest daughter, Lucy J. (born 1878) lists her parents as David Winfree and Emily Winfree (FamilySearch n.d.; Kollatz, Jr. 2013, U.S. Census 1880).

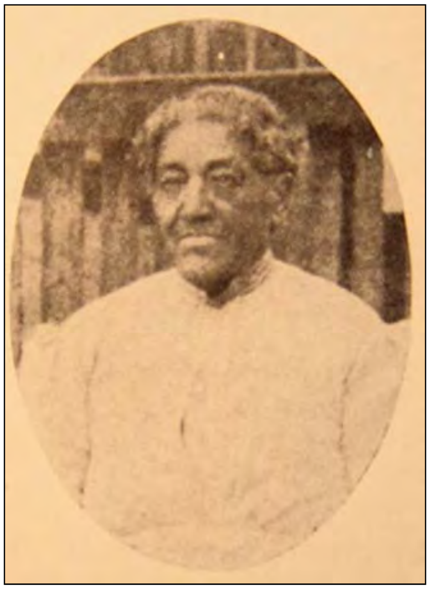

FIGURE 3-232: PHOTOGRAPH OF EMILY WINFREE (RICHARDSON 2017)

David Winfree was born around 1814. In the 1830s, he attended the University of Virginia and later served the Chesterfield County region as a physician and druggist (American Antiquarian Society 1834; U.S. Census 1850). He owned 260 acres of improved land and 442 acres of unimproved land in Chesterfield County (Bureau of the Census 1860). Given that the Slave Schedule for 1860 shows David C. Winfree owning three enslaved males aged 16, 3, and 2, he may have hired help to work his farm (United States Federal Census Slave Schedule [U.S. Census Slave Schedule] 1860). It is notable that the schedule did not list any females under the ownership of David Winfree.

In 1866, "freedman" Emily Winfree acquired two tracts of land. It is on this land that Winfree Cottage was constructed around 1866. In this transaction, Samuel E. Vaden sold a tract of land to A.A. Allen, who acted as trustee for Emily and her children, for a parcel that fronted 75 feet on Allen Road (later known as W. 8th Street, now W. Commerce Road) in Manchester, 50 feet from the intersection of Allen and Porter Roads (Figure 3-233) (City of Richmond Deed Book [CRDB] 48:18). The deed specified the rights that Ms. Winfree had to this lot, including the right of Emily and her children to live there as long as they choose, the right to sell the property and keep the money from that sale, and the right, should Emily not have any living children at the time of her death, to will the property to anyone of her choice (CRDB 48:18). The research completed during this effort could not discern if David Winfree owned the land at any time before it was sold to Emily; however, it should be noted that the deed also states that if Emily has no surviving children at her death and dies without a will, the property shall go back to David C. Winfree, which suggests that he may have had a part in the purchase of this property (CRDB 48:18). Further evidence of their continued connection is suggested by a second tract of land Emily Winfree acquired in 1866, which was sold to her on May 29 by David C. Winfree; this lot was situated in a more rural part of Chesterfield County (CRDB 48:123).

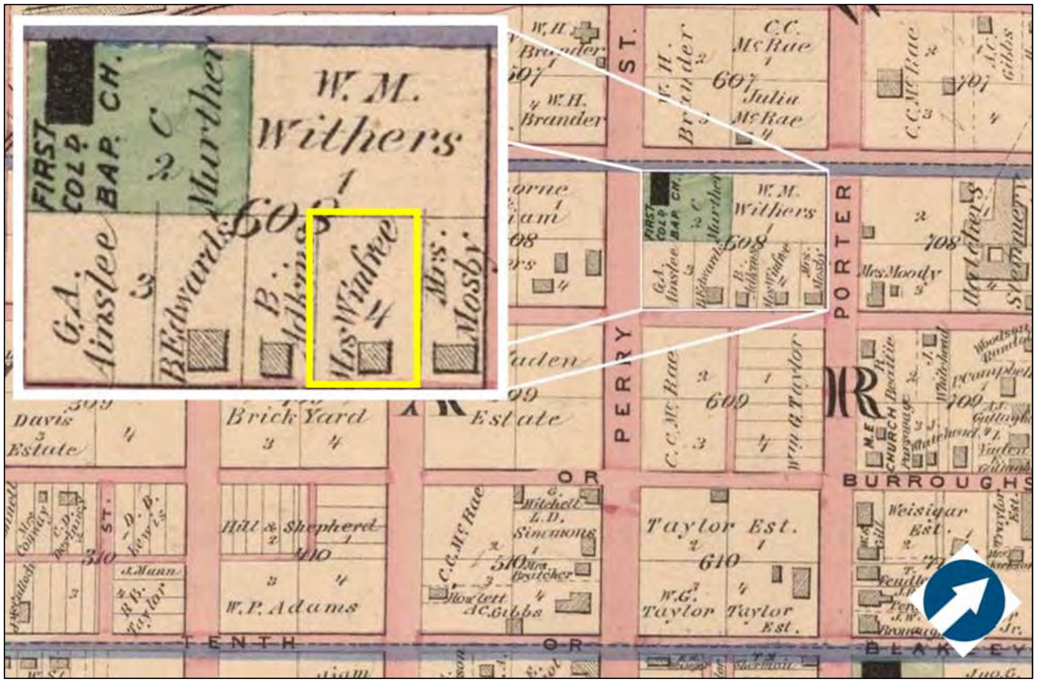

FIGURE 3-233: A PORTION OF THE 1877 MAP OF MANCHESTER, CHESTERFIELD COUNTY NOTING THE LOCATION OF THE WINFREE COTTAGE IN YELLOW (BEERS 1877) (MAP NOT TO SCALE)

In 1870, Emily and her six children (ranging in age one to 16) lived on Allen Road in Manchester. At that time this part of the city was very racially diverse; the U.S. Census for that year lists many of the surrounding families as "white," "black," or "mulatto" (Chataigne and Smith 1888; T.M. Haddock & Co. 1893; U.S. Census 1870). At the end of the nineteenth century, Emily owned another house on the 1500 block of Stockton Street, also in Manchester, between 15th and 16th Street, which was, at that time, a predominantly African American neighborhood (U.S. Census 1900). According to Richmond City Directories in the 1900s and 1910s, Emily worked as a laundress, and her children, several of which continued to live with her at 1515 Stockton Street, were employed as a cook at a restaurant, a laborer at a railroad shop, porters, school teachers, and an upholsterer (Hill Directory Co., Inc, 1906:1271, 1914:1372, 1916; U.S. Census 1900). Emily, with the assistance of Trustee W.C. Pulliam, sold the cottage on Allen Road to Allan Nelson Pettigrew on October 2, 1905 (CRDB 94-B:167). She died in 1919 around the age of 84 (Virginia Department of Health 1919).

Under the Allan Nelson Pettigrew ownership, the Winfree Cottage was a rental property to many different occupants throughout the first two decades of the 1900s; however, steady occupancy arrived with the Poe family, who lived in the house at 209 W. 8th Street for most of the twentieth century. John James Poe, Sr. (1893–1955), his wife Edna (1898–1980), and their children moved to Manchester in the late 1920s. They first rented a house on 3rd Street, but by 1930, all eight members of the Poe family lived in the frame house on W. 8th Street (Hill Directory Company, Inc. 1925, 1927, 1928, 1930; U.S. Census 1930). On August 25, 1945, the owner of the property at that time, Hilda Adelanski, sold the house and lot to Edna Poe, although it was not officially recorded with the circuit court until June 4, 1957, two years after James Poe's death (CRDB 323:419; Virginia Department of Health 1955). For the next several decades, Edna lived in the house, at times accompanied by one or more of her adult children; however, it seems that her second eldest son, Lewis Allen Poe, resided there most often (Hill Directory Company, Inc. 1960, 1965, 1975, 1978).

During the 1960s and 1970s, the residential character of Manchester was quickly lost. Several houses once lined W. 8th Street, however by 1978 only two dwellings remained (house numbers 203 and 209), and by 1980, only 209 W. 8th Street survived (Hill Directory Company, Inc. 1978, 1980). When Edna died in 1980, she bequeathed to her son, Lewis, her residence at 209 W. 8th Street (City of Richmond Will Book [CRWB] 38:488). Lewis (1924–2002) owned, and seemingly lived in, the house for the rest of his life until his death in 2002 (Social Security Administration 2002). In his will, Lewis gave his real estate, including 209 W. 8th Street, to his surviving siblings: Richard E. Poe, Floyd S. Poe, Kathleen Doremus, and Edith P. Craig (CRWB 02-426). The property changed hands twice more in 2002, ending with the sale to the current owner, Manchester Property, LLC, on December 20, 2002 (CRDB 030000068).

According to a 2013 *Richmond Magazine* article (Kollatz, Jr. 2013):

> By October 2002, the home was abandoned and almost swallowed up by commercial buildings. Taylor & Parrish Construction at 209 Commerce Road sought to expand its parking lot, and the house stood in the way. To the rescue came the Alliance to Conserve Old Richmond Neighborhoods (ACORN), then a feisty preservation organization with David Herring as its executive director. He recalls that time. "We had an incredibly short deadline — maybe less than a week — to get it moved," says Herring, who's now the vice president of the Center for Neighborhood Revitalization at the Richmond Better Housing Coalition, which absorbed ACORN in 2011. Taylor & Parrish was agreeable to the cottage's removal.

Although the house was saved, it has been on a temporary platform awaiting a permanent location and use for 15 years. Currently situated in a parking lot adjacent to Main Street Station, there has been discussion of many uses, including an interpretive center for the Richmond Slave Trail Commission; however, at the time of this report, the future of the Winfree Cottage is not yet determined.

3.19.2 Architectural Description

3.19.2.1 Primary Resource Exterior

The Winfree Cottage is a one-story dwelling constructed around 1866 within the boundaries of Manchester, then an independent city in Chesterfield County (Figure 3-234). Because it was moved from its original location in 2002 to its current location in Richmond, the foundation is unknown; it is currently set on a metal flatbed raised on pieces of cut lumber. A moderately pitched, hipped roof sheathed in standing-seam metal covers the weatherboard-clad frame structural system (Figures 3-235 and 3-236). Boxed eaves are clad in wood and extend approximately 6 inches from the plane of the wall on all sides. A patched, square hole along the roof's ridge shows where a central-interior brick chimney once stood (Figure 3-237).

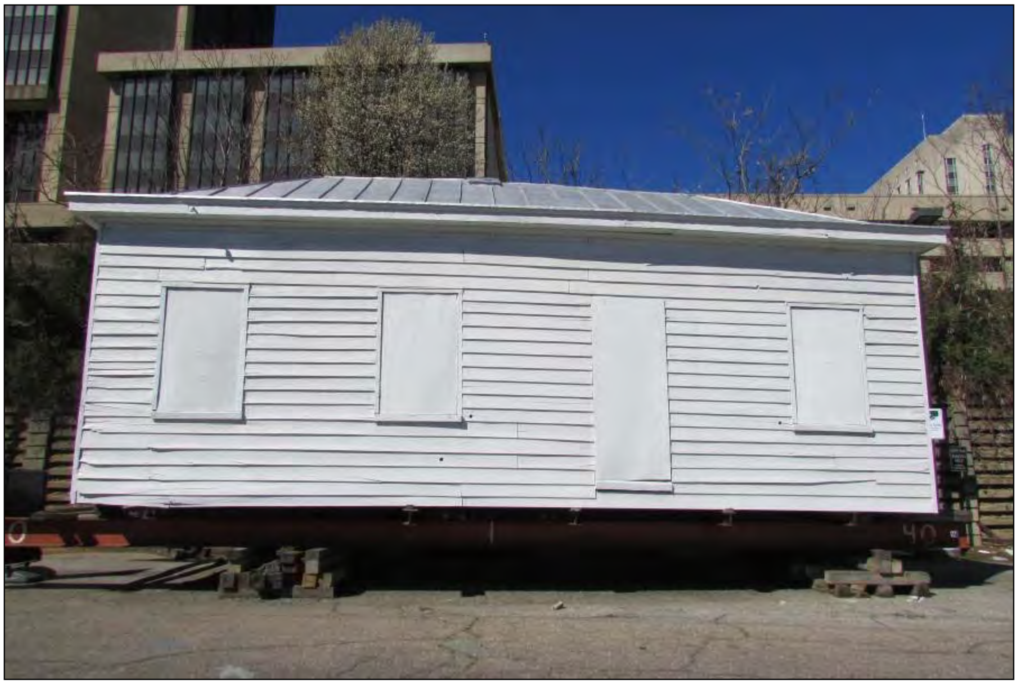

FIGURE 3-235: SOUTHEAST ELEVATION, WINFREE COTTAGE

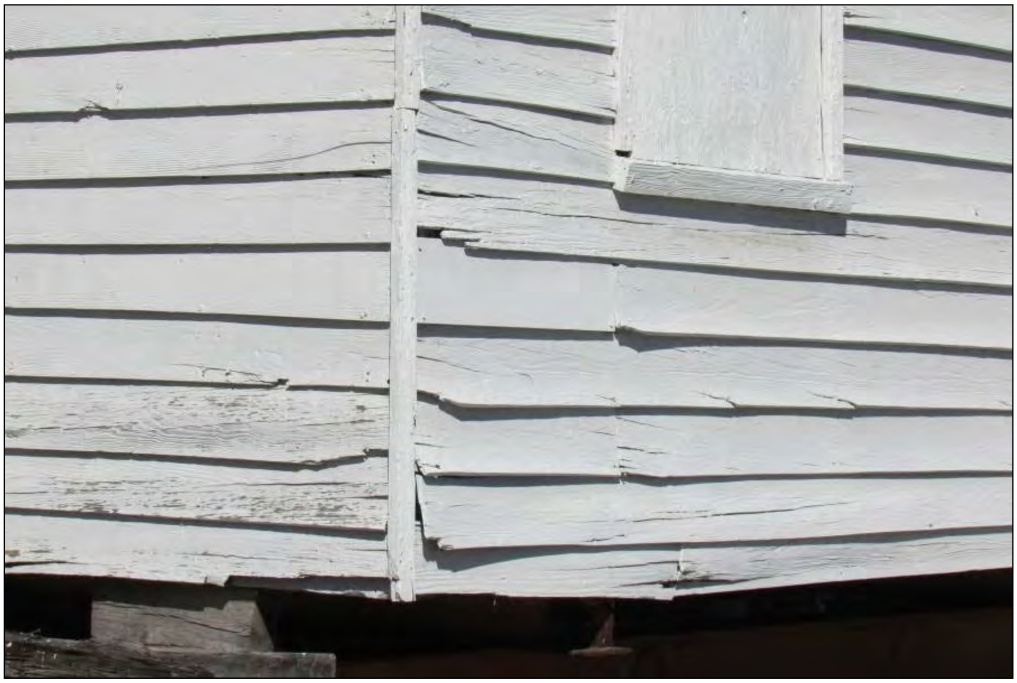

FIGURE 2-236: DETAIL OF SIDING, SOUTH OBLIQUE

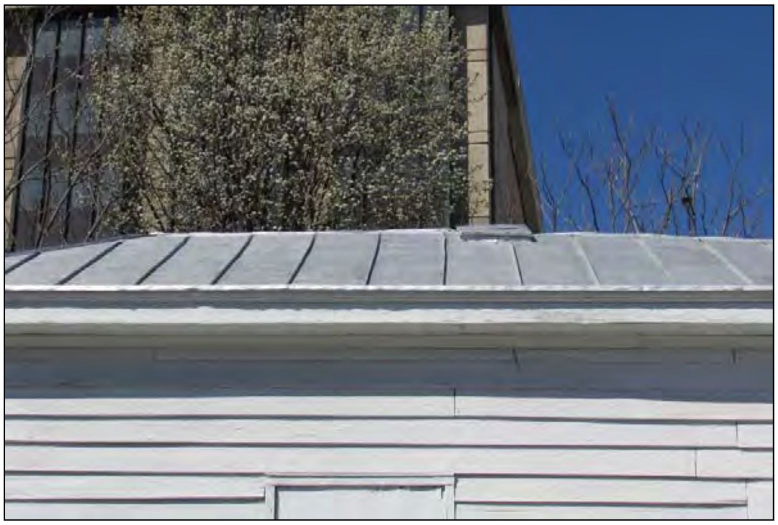

FIGURE 3-237: DETAIL OF FORMER LOCATION OF CHIMNEY, LOOKING NORTHWEST

All fenestration is currently boarded over; however, interior photographs taken for a 2012 blogpost show that the window openings are filled with wood-frame, six-over-six, double-hung sashes (Majer 2012). The house currently has two entrances: the primary is off-centered on what was historically the west elevation that faced W. Commerce Street and the secondary likely once provided access to a one-story ell that extended from the rear (east) elevation. This ell can be seen on historic Sanborn maps, but is no longer extant (Sanborn Map Company 1905b). Photographs from when the Winfree Cottage was first moved in 2002 show the remains of a shed-roofed porch on west elevation (Figure 3-238) (Kollatz, Jr. 2013; Richardson 2017). The shed roof was sheathed in standing-seam metal and supported by modern pieces of lumber acting as brackets; this architectural element is no longer extant (Figure 3-239).

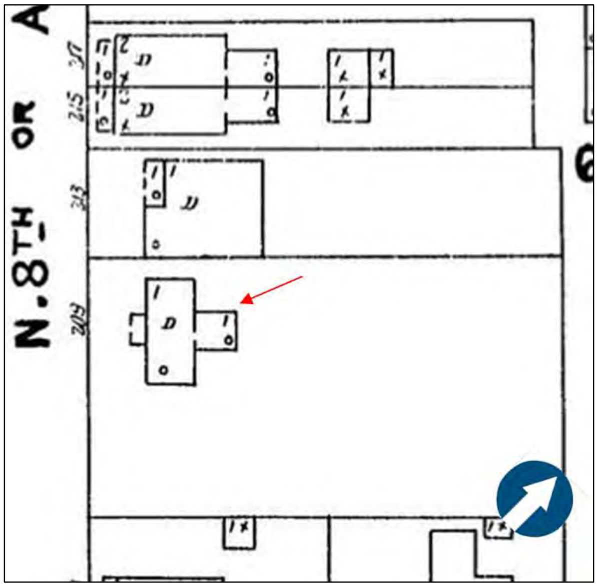

FIGURE 3-238: 1905 SANBORN MAP SHOWING THE WINFREE COTTAGE (DENOTED BY RED ARROW) IN MANCHESTER (SANBORN MAP COMPANY 1905B) (MAP NOT TO SCALE)

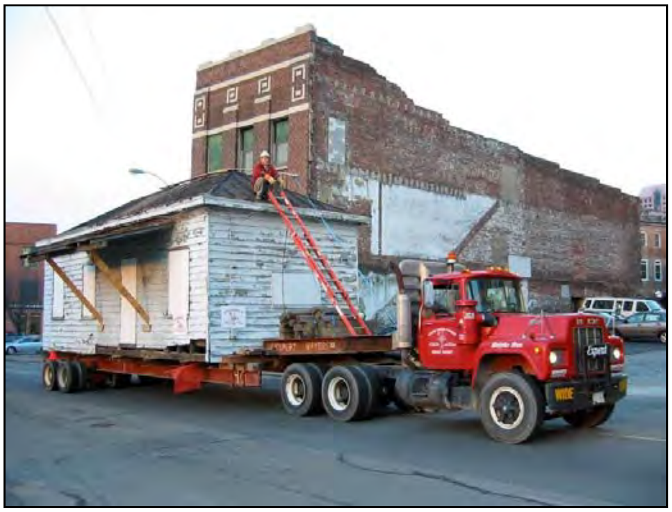

FIGURE 3-239: 2003 PHOTOGRAPH OF THE WINFREE COTTAGE BEING MOVED FROM W. COMMERCE STREET. NOTE THE SURVIVING PORCH ROOF (RICHARDSON 2017).

3.19.2.2 Primary Resource Interior

Images of the building's interior appear in a blogpost from 2012 (Majer 2012). This blogpost shows wide wooden planks covering the floor joists and exposed wooden lath on the walls. The ceiling joists and other roofing members were also exposed. The house featured two rooms separated by a partition wall lined with the remains of a wooden baseboard, and a central-interior brick chimney open on at least one side. The wooden fireplace surround comprised a mantle shelf, wide header, and two unadorned pilasters. The firebox opening has been altered to allow for a stove instead of an open fire. A doorway with a simple wood surround located near the primary (west) elevation provided access between the two rooms (Majer 2012).

3.19.3 NRHP Evaluation

The Winfree Cottage was originally situated on W. 8th Street (now W. Commerce Street) in Manchester, formerly located within Chesterfield County. It was first the house owned by Emily Winfree, a former enslaved person, and her children. In the 1860s, Emily acquired a tract of land in Manchester on which the small one-story cottage was constructed. Some language in the deed suggests that David C. Winfree, a Chesterfield County man who may have been her previous owner, had some involvement in this bargain and sale transaction. Emily, like many enslaved people following the Emancipation Proclamation, faced an uncertain future in the mid-1860s. The construction of the one-story dwelling in urban Manchester is just one of many ways freed African Americans left the southern plantations behind and began to find their own ways in life. Although it is no longer in its original location, the Winfree Cottage is one of the few known surviving physical representations of this time period and aspect of African American history and life around Richmond following the Civil War. For these reasons, it is recommended eligible under Criterion A.

For a resource to be eligible for listing in the NRHP under Criterion B, it must be associated with an important individual within a specific historic context or they must be considered significant within their profession or group (Shrimpton et al. 1990). While Emily Winfree is a notable person, her individual contribution to the context of African American history following the Civil War is not known to be significant. Therefore, the resource is recommended not eligible for the listing under Criterion B.

Historic maps suggest that similar small frame dwellings were common among Manchester's built landscape in the third and fourth quarters of the nineteenth century. However, industrial development in the twentieth century resulted in a loss of much of the nineteenth-century, working-class housing in this region of southern Richmond. Winfree Cottage is an excellent example of this one-story, two-room, frame dwelling that was so prominent among the streets of Manchester following the Civil War. Furthermore, although moved and thereby diminishing the resource's integrity of association, feeling, setting, and location, the house still has many of its original architectural fabric and has a moderate level of integrity of materials, workmanship, and design. As a building that possesses and retains distinctive characteristics of this urban and vernacular type and method of construction, Winfree Cottage is recommended eligible for the NRHP under Criterion C.

According to the NPS guidelines, "a property removed from its original or historically significant location can be eligible if it is significant primary for architectural value or it is the surviving property most importantly associated with a historic person or event" (Shrimpton et. al 1990). Because Winfree Cottage is one of the only surviving examples of housing for former enslaved persons following the Civil War, it is also recommended eligible under Criteria Consideration B. As an architectural resource, the Winfree Cottage was not evaluated under Criterion D.

In sum, the Winfree Cottage is **recommended eligible for the NRHP under Criteria A and C, and also Criteria Consideration B for a moved building.**

The period of significance for the Winfree Cottage is recommended to begin in 1866, when the cottage is estimated to have been constructed, and end in 1905, when Emily Winfree sold the cottage. The NRHP boundaries are recommended to be strictly around the building as is set on metal flatbed and is not located in its original or permanent location (Figure 3-240).

3.20 RAILROAD YMCA (127-0344-0123)

The Railroad Young Men's Christian Association (YMCA) (127-0344-0123), currently housing loft apartments and two commercial spaces, is located at 1552 E. Main Street in Richmond, Virginia. Set on a 0.21-acre lot immediately southeast of Richmond's Main Street Station (127-0172) and a branch of the C&O Railroad Corridor (127-6793), the property is bounded by E. Main Street to the southwest, N. 17th Street in the southeast, multiple commercial properties in the northeast, and a paved-asphalt parking lot for the Main Street Station in the northwest. It is located within the Shockoe Valley and Tobacco Row Historic District (127-0344), a NRHP-listed historic district encompassing Richmond's original town settlement filled with a mix of residential, commercial, and manufacturing activity. The densely populated urban area has been moderately altered with new construction; however, it still remains primarily commercial and industrial in nature. The parcel is primarily filled by the rectangular building, with poured-concrete sidewalks lining all sides. A small, paved-asphalt parking lot is situated in the northwest and accessed by East Main Street to the southwest, and a paved-asphalt alley lines the northeast and is accessed to the southeast from N. 17th Street (Figure 3-241). A small median strip between the sidewalk and East Main Street features a large deciduous tree.

3.20.1 Historic Context

Founded in 1854, the Richmond YMCA was organized with the intentions to provide young males a library and reading room; lectures, devotional meetings and Bible classes; a safe, wholesome home-away-from-home to counteract the "lure and ruin" of the city; and to bring them under religious and moral influences (Crews 2004). Although the Richmond YMCA was founded in 1854, it was not until the mid-1870s that a specific railway outreach program, known as the National YMCA Railroad Movement, was developed. The National YMCA started the outreach program to railroad men in 1872 beginning at a Cleveland passenger station, and soon thereafter, it became "its largest effort for blue-collar workers until the decline of the nation's railway workforce" (Crews 2004:87).

The Richmond Main Street Station (127-0172) and the current CSXT railroad were built in 1901 through joint funding by the Seaboard Air Line Railroad (SAL) and the Chesapeake and Ohio Railway (C&O). The general baggage agent of the C&O, Charles Lorraine, noticed restless men of the layover rail crews having the potential to wander into the dark corners of the city (Richmond Railroad Y.M.C.A. Men 1909). Mr. Lorraine "set to work to provide a reading room and a game room for these men, under the supervision of a Y.M.C.A. Secretary" (Richmond Railroad Y.M.C.A. Men 1909). To address the issue of temporary housing for layover staff, the fourth floor of the Richmond Main Street Station was dedicated to the Railroad YMCA through contributions and support from five railroad companies who promoted their workforce to utilize YMCA services: the C&O, RF&P, SAL, ACL, and Southern Railways (Southern) (Kollatz, Jr. 1997:20). As membership grew, there was a need for more space.

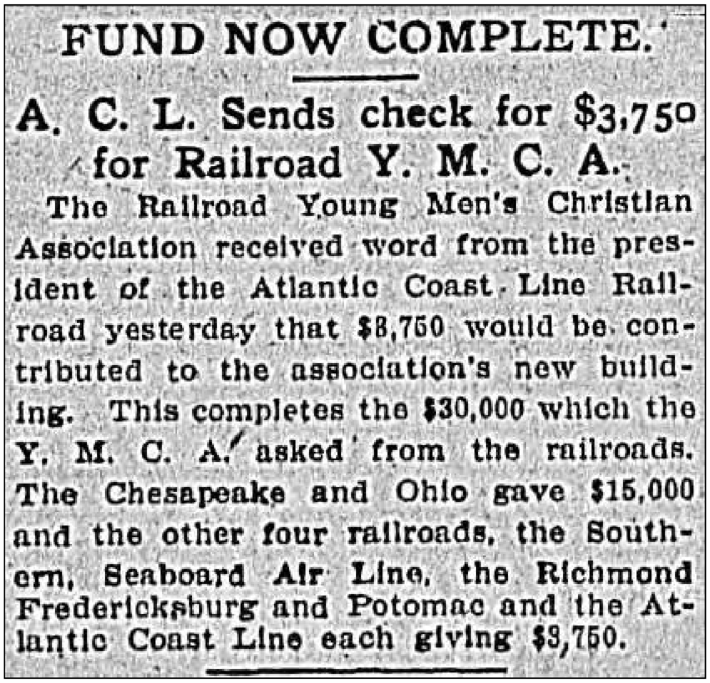
Location of the Railroad YMCA (127-0344-0123)

03/2018

\\DTS2\Main Job\14-015 RAPS\GIS\2018\Work\14_015_AH_Phil.mxd | Last Updated: 03.20.2018

The Railroad YMCA requested a total of $30,000 from the five railroads for the construction of the association's new building (Richmond Times-Dispatch 1906:11). In 1907, the Richmond YMCA purchased multiple small properties at the northwest corner of N. Main and Market (17th) Streets that fronts Market Street for $15,000 (City of Richmond Deed Book [CRDB] 191-A:443, 445, 447; 192-A:8; 199-D:196, 198). The cost of construction and equipping the new Railroad YMCA building cost approximately $100,000 (Figure 3-242) (Crews 2004:87). The Railroad YMCA building was designed by Wilson, Harris, and Richards, the same Philadelphia architects that designed adjacent Main Street Station, as evident in the physical similarities of the two buildings (Figures 3-243 and 3-244) (Tatman 2017; Wilson 2002:192). The firm, which operated from 1902 to 1910, concentrated on commercial and railroad projects.



FUND NOW COMPLETE.

A. C. L. Sends check for $3,750 for Railroad Y. M. C. A.

The Railroad Young Men's Christian Association received word from the president of the Atlantic Coast Line Railroad yesterday that $3,750 would be contributed to the association's new building. This completes the $30,000 which the Y. M. C. A. asked from the railroads. The Chesapeake and Ohio gave $15,000 and the other four railroads, the Southern, Seaboard Air Line, the Richmond Fredericksburg and Potomac and the Atlantic Coast Line each giving $3,750.

FIGURE 3-243: RAILROAD YMCA BUILDING UNDER CONSTRUCTION IN 1908 (LIBRARY OF CONGRESS [LOC] 1908)

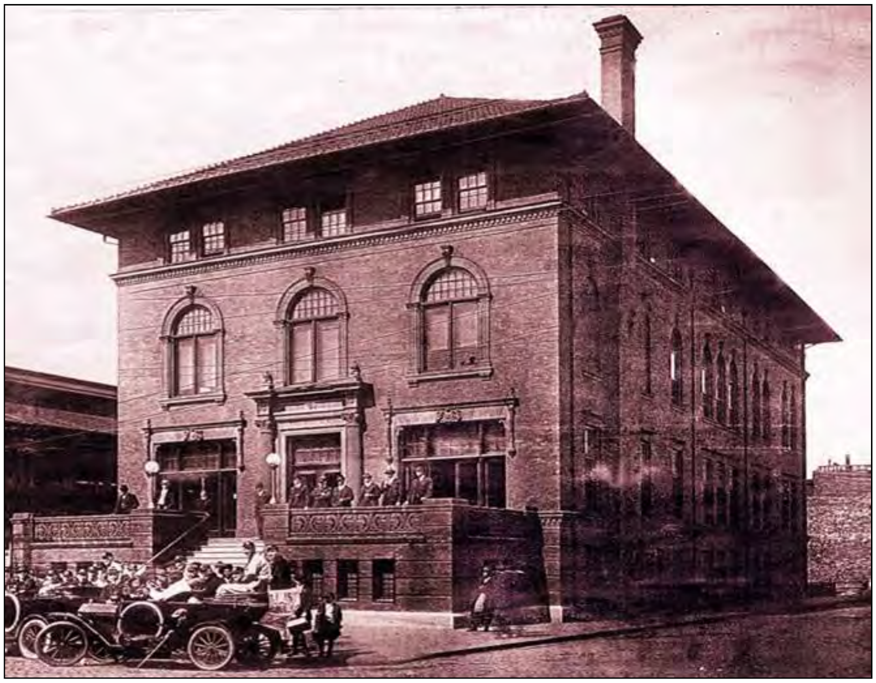

FIGURE 3-244: RAILROAD YMCA, CIRCA 1910 (RVAAPARTMENT.COM 2014)

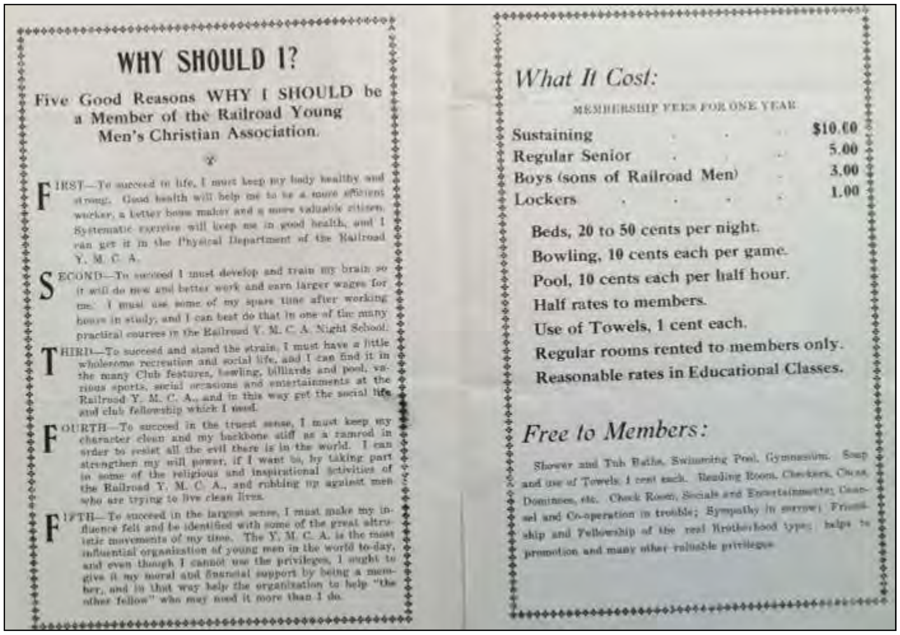
The building offered "showers and tub baths, a swimming pool, a gym, soap and towels, a reading room, checkers, chess, dominoes and social events" as well as sleeping space, a bowling alley, poolroom, auditorium, kitchen, and ladies' parlor (Crews 2004:87). It not only provided service to the railroad employees but also to their families and travelers using the railroad company and National YMCA funds (Railroad YMCA History Project 1999). Membership, which cost $10 for one year in 1915, included benefits such as entertainment and religious activities, exercise opportunities, and career-related courses that were geared toward railway operations (Figure 3-245) (Crews 2004:87–88; Railroad Young Men's Christian Association Richmond 1915). Poor boys of the Shockoe Valley District were also served at the Railroad YMCA and offered membership for free (Kollatz, Jr. 1997:20). Other organizations were eventually served through the 1930s and 1940s including Scout troops, Sunday school groups, and sons of railroad men (Kollatz, Jr. 1997:21).



WHY SHOULD I?

Five Good Reasons WHY I SHOULD be a Member of the Railroad Young Men's Christian Association.

FIRST—To succeed in life, I must keep my body healthy and strong. Good health will help me to be a more efficient worker, a better home maker and a more valuable citizen. Systematic exercise will keep me in good health, and I can get it in the Physical Department of the Railroad Y. M. C. A.

SECOND—To succeed I must develop and train my brain so it will do new and better work and earn larger wages for me. I must use some of my spare time after working hours in study, and I can best do that in one of the many practical courses in the Railroad Y. M. C. A. Night School.

THIRD—To succeed and stand the strain, I must have a little wholesome recreation and social life, and I can find it in the many Club features, bowling, billiards and pool, various sports, social occasions and entertainments at the Railroad Y. M. C. A., and in this way get the social life and club fellowship which I need.

FOURTH—To succeed in the truest sense, I must keep my character clean and my backbone stiff as a ramrod in order to resist all the evil there is in the world. I can strengthen my will power, if I want to, by taking part in some of the religious and inspirational activities of the Railroad Y. M. C. A., and rubbing up against men who are trying to live clean lives.

FIFTH—To succeed in the largest sense, I must make my influence felt and be identified with some of the great altruistic movements of my time. The Y. M. C. A. is the most influential organization of young men in the world to-day, and even though I cannot use the privileges, I ought to give it my moral and financial support by being a member, and in that way help the organization to help "the other fellow" who may need it more than I do.

What It Cost:

MEMBERSHIP FEES FOR ONE YEAR

Sustaining	$10.00
Regular Senior	5.00
Boys (sons of Railroad Men)	3.00
Lockers	1.00

Beds, 20 to 50 cents per night.

Bowling, 10 cents each per game.

Pool, 10 cents each per half hour.

Half rates to members.

Use of Towels, 1 cent each.

Regular rooms rented to members only.

Reasonable rates in Educational Classes.

Free to Members:

Shower and Tub Baths, Swimming Pool, Gymnasium. Soap and use of Towels 1 cent each. Reading Room, Checkers, Chess, Dominoes, etc. Check Room, Socials and Entertainments; Counsel and Co-operation in trouble; Sympathy in sorrow; Friendship and Fellowship of the real Brotherhood type; helps to promotion and many other valuable privileges.

FIGURE 3-245: RAILROAD YMCA PAMPHLET ADVERTISING MEMBERSHIP SERVICES (RAILROAD YOUNG MEN'S CHRISTIAN ASSOCIATION RICHMOND 1915)

In December 1971, the Railroad YMCA was closed by the executive director, Porter Myers (Kollatz, Jr. 1997:21). At the time, Myers indicated that he did his best to keep the place clean; however, purposeful messes and violence led him to shut down the operation. In 1972, the property was conveyed to the Mission Army, Inc., an independent relief agency, who reclaimed the extreme damage done to the building caused by flooding from Hurricane Agnes (Figure 3-246) (CRDB 391-C:15; Kollatz, Jr. 1997:21). Although the Mission Army attempted to keep the Railroad YMCA running, by 1979, the building's extensive health and building code violations led to the city inspectors moving to close it down (Kollatz, Jr. 1997:21). In 1980, a Virginia partnership called Market Slip Association purchased the property with the intention of selling it to a developer who could convert it into an apartment building or bed and breakfast with the help of historic tax credits (CRDB LR007670708:708–710, LR002402259:2259–2262; Kollatz, Jr. 1997:21). In 1999, the property was conveyed to the Historic Housing, LLC, a development company specializing in revitalizing historic buildings in Richmond (CRDB LR990024136:405; LR990024137:406–408; Schwartz 2012). In 2001, the tax credit-funded renovation of the Railroad YMCA, converting it into lofted bedroom apartments, was completed by the development company for approximately $3.3 million (Figure 3-247) (Style Weekly 2017). Some spaces within were returned to a similar use, including the former restaurant at the front of the building which is now used as a catering and event space, according to the current property manager, Kim Pitts (Kim Pitts, personal communication 2018).

FIGURE 3-247: PLAT OF RESURVEY OF "RAILROAD Y/1548 E. MAIN STREET, CITY OF RICHMOND, VIRGINIA" (CRDB LR120007969)

3.20.2 Architectural Description

3.19.2.1 Primary Resource Exterior

The Railroad YMCA is a three-story, three-bay, rectangular, Italian Renaissance Revival-style commercial building constructed in 1907 by the Philadelphia architectural firm of Wilson, Harris and Richards (Figures 3-248 through 3-250) (Wilson 2002:192). The building currently is in use as residential lofts and apartments as well as a restaurant (Rosie Connolly's Pub & Restaurant) and a catering event space. The building sits on a continuous, raised basement foundation supporting a masonry structural system all sheathed in a brick laid in a running bond imitating Roman brick, calling to the Italian Renaissance Revival style in which it was constructed. The raised basement is lined with two rows of squared stone at the base, with the top row beveled, and six rows of regular stretcher bond brick to one row of relief stretcher bond brick. A molded concrete water table with a denticulated cornice beneath the table separates the basement from the first story while a denticulated belt course is located between the second and third stories. The building is covered by a low-pitched, hipped roof sheathed in terra cotta tile with open, overhanging eaves containing scrolled, wooden brackets and a geometric cornice (Figure 3-251). An exterior-end chimney with a corbeled cap is located in the south half of the southeast elevation which pierces the overhanging roof eaves and features a corbeled base. A central shed dormer is centered in the northwest and southeast elevations.

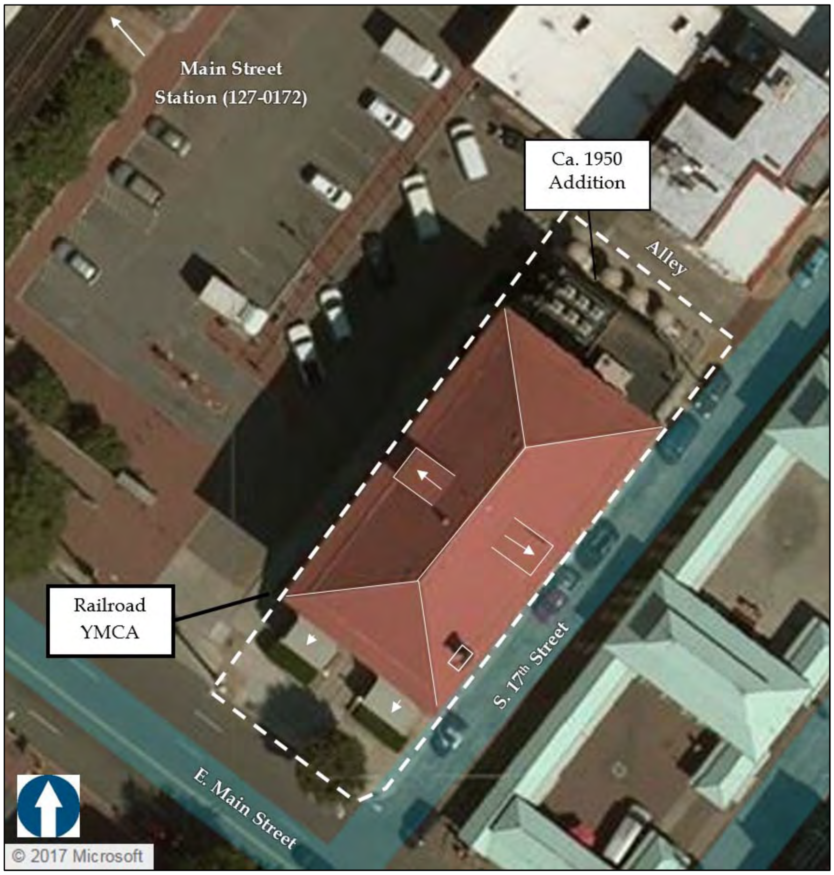

FIGURE 3-248: SITE PLAN OF THE RAILROAD YMCA (MICROSOFT 2017) (NOT TO SCALE)

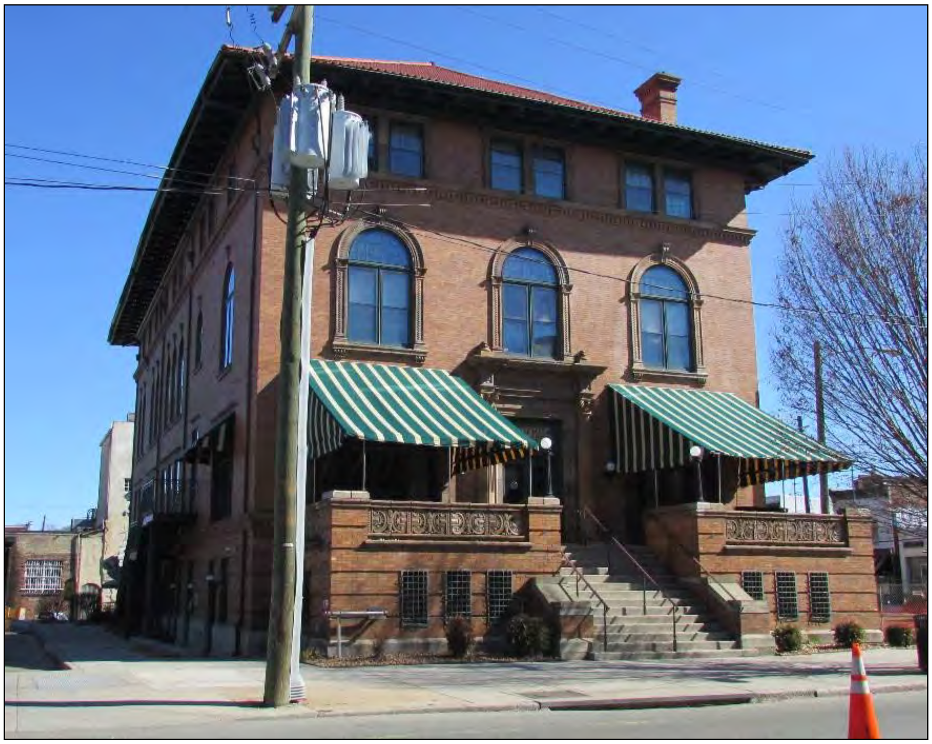

FIGURE 3-249: WEST OBLIQUE

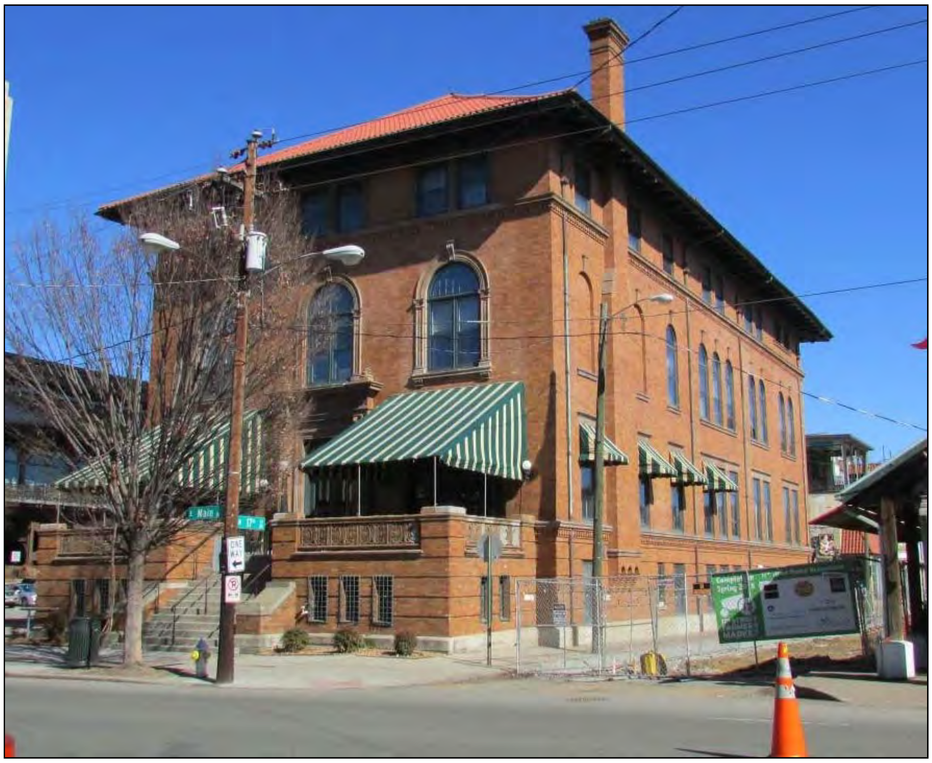

FIGURE 3-250: SOUTH OBLIQUE

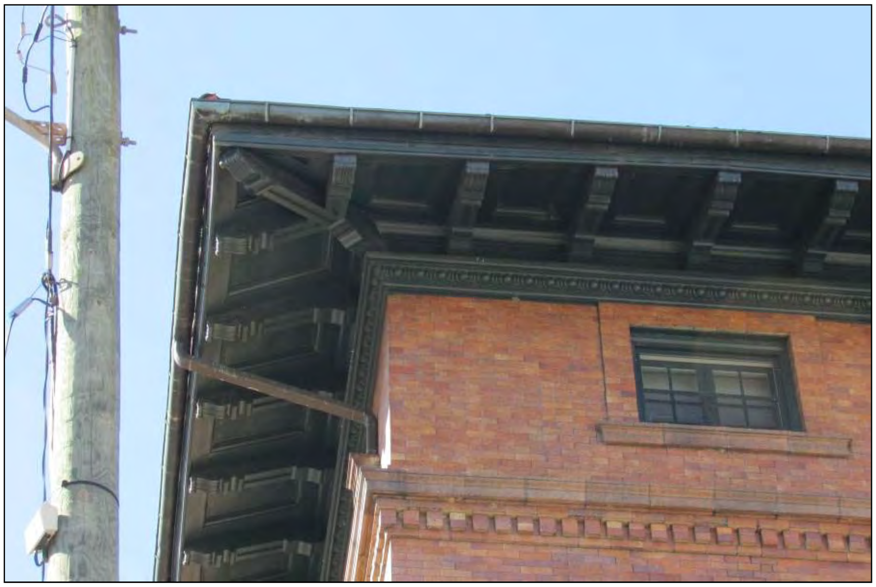

FIGURE 3-251: DETAIL OF EAVE AND CORNICE, WEST CORNER

Centered on the southwest elevation (façade) is the former primary entrance to the building. It is currently the primary entrance for the catered event space. The heavily ornamented entrance, typical of the Italian Renaissance Revival style in which the building was constructed, is filled with a double-leaf, single-pane, single-panel, wood door and framed by fluted, engaged columns with Corinthian capitals and a full decorated entablature and architrave (McAlester 2015:406). The entablature is engraved with "Railroad Branch Y.M.C.A." (Figure 3-252). A rectangular, stained glass, metal-frame transom is set above the entrance and reads "Citi Bar Chop House." The remaining two bays in this story are filled with a double-leaf, wood-and-glass door flanked by single-light, wood-frame sidelights and a topped by a large multi-light, wood-frame transom. Metal-frame, cloth-covered awnings extend from the outer bays, providing a protected area of the terrace that spans the façade for outdoor dining. The terrace along the façade is accessed by a grand central staircase, leading directly to the primary access to the catered event space, which comprises 13 concrete steps lined with a squared, concrete-and-brick balustrade (Figure 3-252). Window openings in the foundation are barred with metal. At the pinnacle of the staircase, access to the southern and western portions of the terrace have been blocked by a metal rail. The remainder of the terrace is lined by a decorative balustrade.

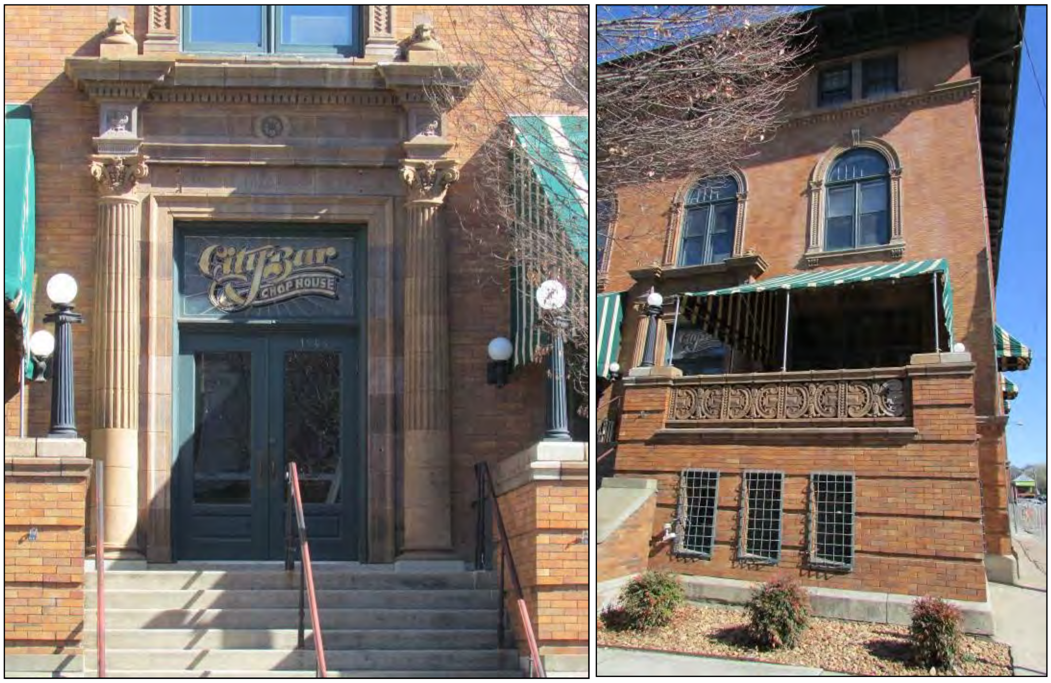

FIGURE 2-252: DETAIL OF PRIMARY ENTRANCE TO EVENT SPACE, SOUTHWEST ELEVATION (LEFT); DETAIL OF TERRACE AND FENESTRATION, SOUTHWEST ELEVATION (RIGHT)

Entrance to the residential portion of the resource is obtained by several single-leaf, metal, paneled doors with multiple lights. Most doors are topped by a single-light, wood-frame, transom. Other fenestration includes paired and single, one-over-one, wood-frame, double-hung-sash windows, some of which feature a single- and multi-light, arched transom set above with a stone keystone (Figure 3-253). Windows in the façade also have decorative stone trim creating a Florentine arch springing from pilasters capped with Corinthian-style capitals. Those with no arched window feature a flat stone lintel. Windows in the raised basement and third story are eight-over-eight, wood-frame, double-hung sashes with wood surrounds and relief brick trim. A "Romeo and Juliet" door is located in the third story of the northwest elevation, although it may have been an access to a fire escape; it is filled with a single-leaf, paneled, wood door with six lights and is covered by a metal rail (Figure 3-253) (Kim Pitts, personal communication 2018). A two-story, flat-roof addition clad in the same materials as the core extends from the north half of the northeast elevation while a one-story, frame addition extends from the east half of the elevation. Both additions were constructed circa 1950 and currently houses a restaurant and its kitchen (Figure 3-254).

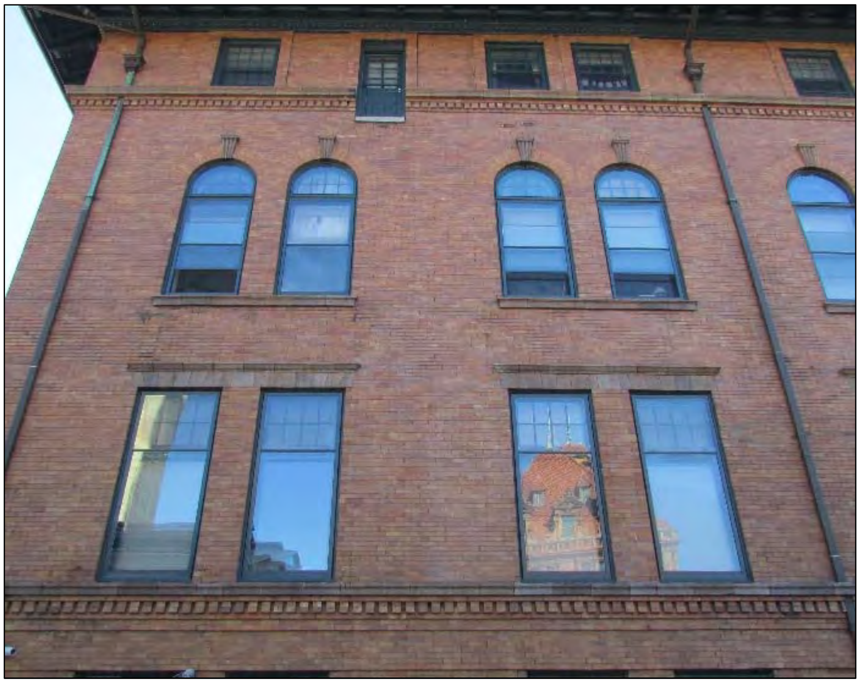

FIGURE 3-253: DETAIL OF FENESTRATION, NORTHWEST ELEVATION

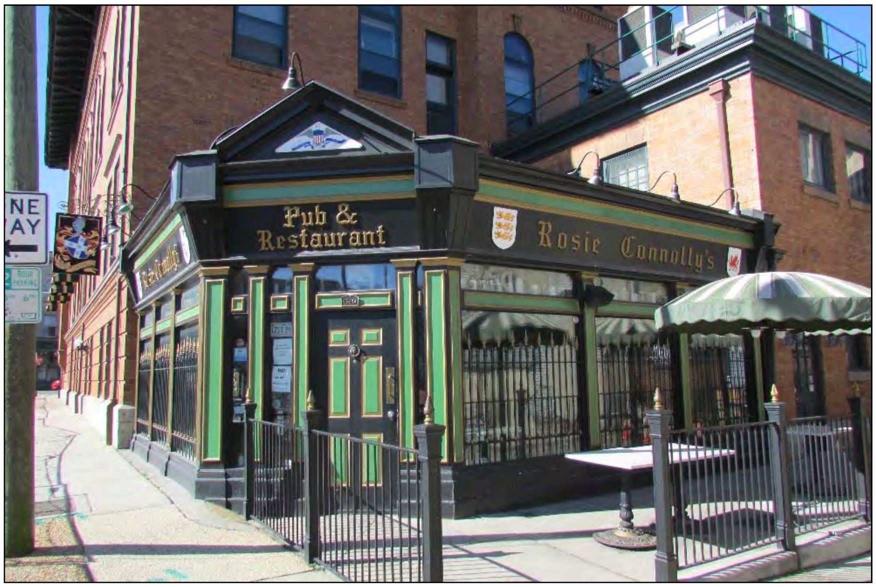

FIGURE 3-254: DETAIL OF ATTACHED RESTAURANT, NORTHEAST ELEVATION

3.19.2.2 Primary Resource Interior

Entrance to the residential portion of the Railroad YMCA is obtained through a single-leaf door in the basement level of the northwest elevation. It opens into a four-story stairwell featuring a wood staircase that is partially lined with a turned wood balustrade that pauses at a landing in each story (Figure 3-255). The walls that partially house the staircase are drywall with an ADA compliant metal stair rail and chair rail. The stairs themselves are partially covered by rubber matting and the landings feature modern carpeting. An elevator and associated elevator room, added at a later date than the construction of the building, are also accessed in the basement level of the stairwell.

The first, second, and third stories of the northeast two-thirds of the building have a similar floor plan (Figure 3-256). Each floor contains a central carpet-clad hallway, running northeast to southwest, which is accessed by a single-leaf, wood, four-paneled door by the stairwell. Each hallway is also accessed by the elevator in the northwest wall. The hall is lined with a wood chair rail and with a varying number of single-leaf doors on the southeast and northwest walls, depending on how many individual lofts there are on the respective floor (Figure 3-255). The property manager stated that each residential room is in its original layout save for the addition of individual laundry closets or bathrooms. Also, the current property manager confirmed that all doors within the residential section of the building in each hallway are original (Kim Pitts, personal communication 2018). The southwest thirds of the second and third stories also contain residential lofts and are set up in a similar format to the remainder of the floor with a hallway accessed by the stairwell.

FIGURE 3-256: FIRST STORY FLOOR PLAN (TOP); SECOND AND THIRD STORY FLOOR PLAN (BOTTOM) (NOT TO SCALE)

During the current survey, access to two individual residential units or "lofts" was granted by the property manager. A loft at the north corner of the third story opens directly into a small kitchenette that lined a portion of the northeast wall. The loft is primarily covered in the original wood flooring save for the kitchenette area which is covered in laminate tile. A carpet-clad, winder staircase lined with a metal and wood rail is situated in the northeast portion of the loft which provides access to the loft space above. The ceiling is open to the wood framing of the hipped roof and eaves (Figure 3-257). This loft features the "Romeo and Juliet" door in the southeast wall previously mentioned (Figure 3-257). The other loft available for viewing during the survey is located in the southwest portion of the second story. Accessed by a single-leaf, wood door, the entrance opens into an open living area with a coffered ceiling and covered in original wood flooring (Figure 3-258). A small kitchenette is in the northeast wall. Along the southeast wall is a bedroom and an enclosed winder staircase that leads to a loft space (Figure 3-258).

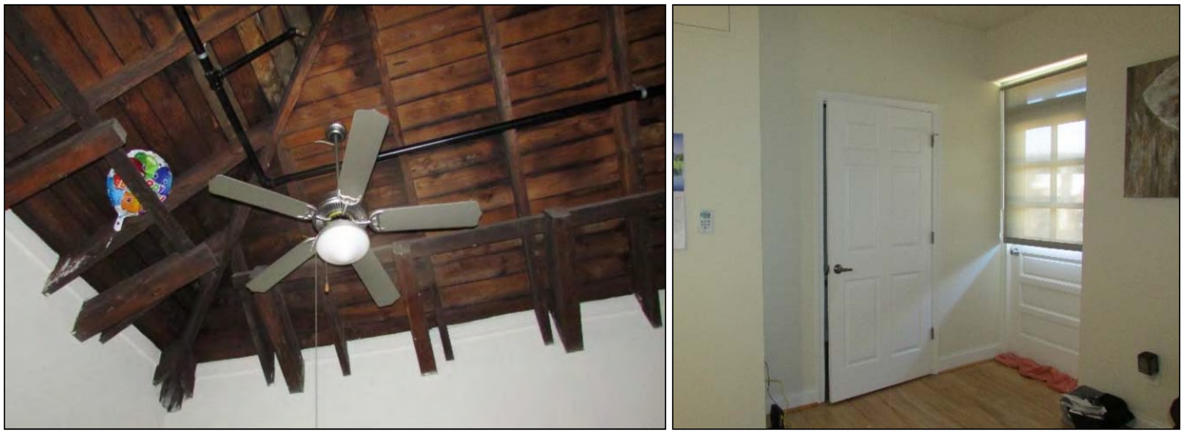

FIGURE 3-257: EXPOSED ROOFING SYSTEM IN THIRD-STORY LOFT (LEFT); VIEW OF "ROMEO AND JULIET" DOOR IN THIRD-STORY LOFT, LOOKING WEST (RIGHT)

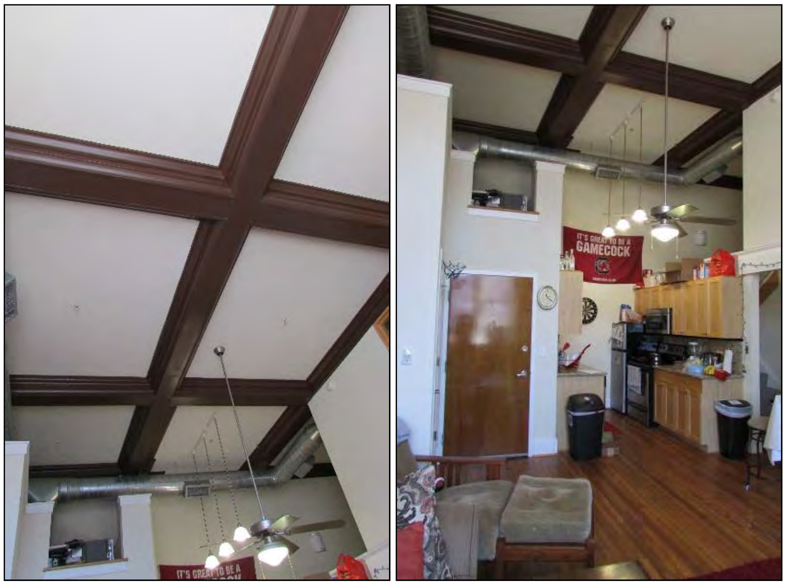

FIGURE 3-258: VIEW OF CEILING IN SECOND-STORY LOFT (LEFT); SECOND-STORY LOFT, LOOKING NORTHEAST (RIGHT)

The catering and event space encompasses the southwest third of the building in the basement level and first story. The basement level contains a full contemporary kitchen, and an enclosed stairwell along the northeast wall of the kitchen leads to the event space in the first story. The first story event space features wood flooring and paneled wood walls. A bar is located along the northwest wall while a large chimney opening with a marble mantel surround is in the southeast wall (Figure 3-259). A recessed panel filled with a mirror is set beneath the simply decorated wood mantelshelf and beveled wood columns. Two partition walls block of the primary entrance in the southwest elevation and a waiters' area in the northeast portion of the room. An enclosed staircase to the second story is visible in the west half of the northeast wall (Figure 3-259). Access to the remainder of the basement and the restaurant (Rosie Connolly's Pub & Restaurant) on the northeast side of the building was not granted during the current survey.

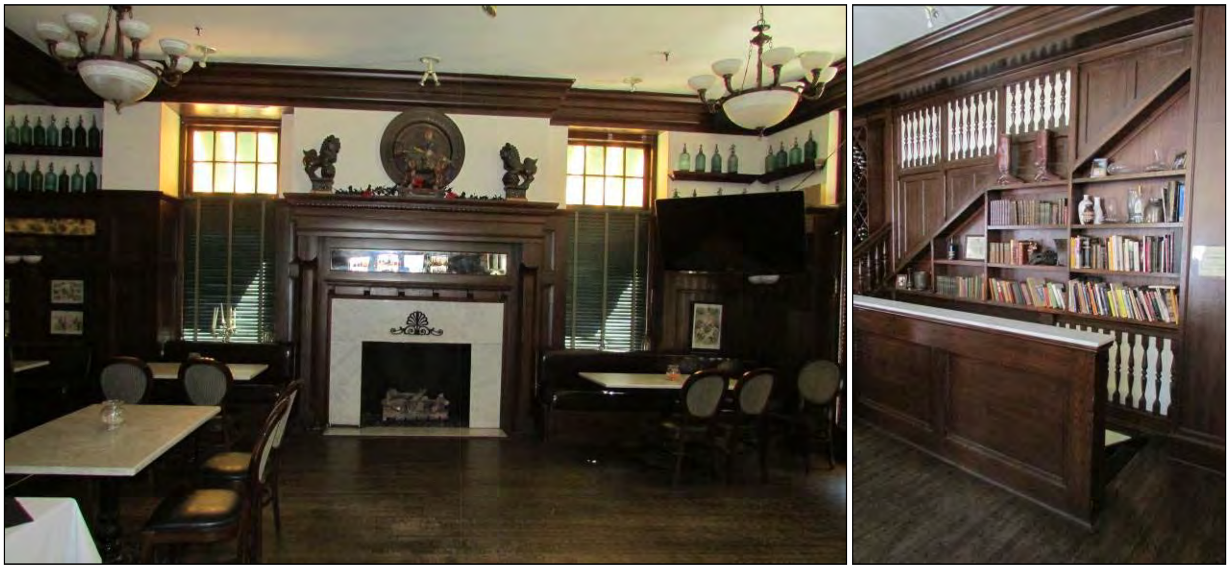

FIGURE 3-259: SOUTHEAST WALL IN CATERING EVENT SPACE IN FIRST STORY (LEFT); STAIRCASE TO BASEMENT LEVEL AND ENCLOSED STAIRCASE TO SECOND STORY, LOOKING NORTH (RIGHT)

3.20.3 NRHP Evaluation

Constructed as Richmond's Railroad YMCA (127-0344-0123) chapter building, this resource served the traveling railroad men and their families as well as local poor boys and men until the 1970s as a safe-haven with bed and board. It has since been converted to a loft apartments building with an attached restaurant to the rear and a catered event space. Although the building has had some common modifications, such as a rear addition and interior alterations funded through tax credits to accommodate separate living spaces and catered event spaces, the resource retains a sufficient level of integrity in design, location, association, materials, feeling, setting and workmanship to convey its historic purpose and use.

The NPS outlines the considerations for which a property can be eligible for the NRHP under Criterion A as: "To be considered for listing under Criterion A, a property must be associated with one or more events important in the defined historic context… The event or trends, however, must clearly be important within the associated context… and it must retain historic integrity" (Shrimpton et al. 1990). The building held an important organization, the YMCA, which assisted the early-twentieth-century railway employee and their families with wholesome living and activity spaces during their travels. It continued in this operation for the local poor boys, acting as a safe haven and a community center. As such, the Railroad YMCA is recommended eligible for the NRHP under Criterion A for its strong association with railroad transportation in Richmond as well as the larger national YMCA movement. The resource is not known to be associated with one significant person from history and because of this, it is recommended not eligible under Criterion B.

Criterion C as outlined by NPS pertains to "properties significant for their physical design or construction, including such elements as architecture, landscape architecture, engineering, and artwork." For a resource to be eligible for the NRHP under Criterion C, it must "Embody distinctive characteristics of a type, period, or method of construction, represent the work of a master, possess high artistic value, or represent a significant and distinguishable entity whose components may lack individual distinction" (Shrimpton et al. 1990). The resource is an exceptional example of a restrained version of the Italian Renaissance Revival style in the Shockoe Valley and Tobacco Row Historic District (127-0344) and in Richmond. The building's symmetrical façade, arched window openings, elaborate Classical entrance, and robust terrace are identifiable Italian Renaissance Revival-style features of the Railroad YMCA (McAlester 2015:406). The building was also designed by the Philadelphia-based architectural firm of Wilson, Harris and Richards, the firm responsible for Richmond's Main Street Station (127-0172), listed in the NRHP in 1970 and as a National Historic Landmark (NHL) in 1976, which was constructed in the Beaux Arts/French Renaissance Revival architectural style that stems from the same Eclectic movement as the Italian Renaissance Revival style (McAlester 2015:406). For these reasons, the Railroad YMCA is recommended as locally significant under Criterion C. As an architectural resource, it was not evaluated under Criterion D.

In sum, the Railroad YMCA is **recommended as eligible at the regional and national level under Criterion A and at the local level under Criterion C.** The resource was constructed during the period of significance (1737–1930) of the Shockoe Valley and Tobacco Row Historic District (127-0344) and continues to reflect the architectural trends within the district. The resource is **recommended as contributing to the Shockoe Valley and Tobacco Row Historic District (127-0344).**

The Railroad YMCA suggested period of significance begins in 1907, when the building was constructed, to 1970, the year in which the YMCA operations in the building ceased. The proposed NRHP boundaries for the Railroad YMCA immediately surrounds the building, encompassing it in full (Figure 3-260).

3.21 PHILIP MORRIS LEAF STORAGE WAREHOUSE (127-0197)

The Philip Morris Leaf Storage Warehouse (127-0197), recently purchased by Capital One and converted into a business incubator, is located at 1717–1721 E. Cary Street in Richmond, Virginia. Set on a 0.21-acre lot, it is located in Richmond's Shockoe Bottom area, more particularly in Shockoe Valley and Tobacco Row Historic District (127-0344), the NRHP-listed historic district encompassing Richmond's original town settlement filled with a mix of residential, commercial, and manufacturing activity. South of the resource are the canals of the James River and an elevated section of a branch of the C&O Railroad Corridor (127-6793) that leads to Main Street Station (127-0172), and immediately west is I-95. The triangular-shaped parcel is bounded by E. Cary Street to the northeast, S. 18th Street to the southeast, Dock Street and the existing railroad to the southwest and west. The densely populated urban area has been moderately altered with new construction; however, it still remains primarily commercial and industrial in nature. The parcel is primarily filled by the trapezium-shaped building, with sidewalks composed of a combination of poured-concrete and modern brick to the northeast, southeast, and southwest. A small, paved-asphalt parking area is situated in the west corner of the property and is accessed by East Cary Street in the north (Figure 3-261). A small patch of grass is located southwest between the building and Dock Street, where a large steel structural system supporting the elevated railroad sits. The subdued International-style commercial building is similar to the warehouse immediately northeast, the Philip Morris Heat Storage Warehouse at 20–28 S. 18th Street (127-0344-0328).

3.21.1 Historic Context

The land on which the Philip Morris Building at 1717–1721 E. Cary Street is located on is in an area of Richmond that has been heavily urban and industrial for centuries. Situated north of the James River and among a network of railroad tracks, including the Richmond and Danville Railroad, the Richmond and Alleghany Railroad, and the C&O Railroad, as they were known during the late-nineteenth century, this lot between 17th and 18th Streets was owned by Benjamin T. Crump and Charles H. West (CRDB 122B:481; Sanborn Map Company 1886, 1895). These partners had several buildings on the corner lot, including a one-story office, a one-story building for splitting wood, a coal shed, and a three-story ship chandlery; the other half of the block was filled with the Virginia Paper Company and the J.C. Smith's Rag Warehouse (Sanborn Map Company 1886).

Out of these buildings, Crump and West partners operated the business Crump & West Company, which specialized in coal and wood with an advantageous lot near the river, canal, and railroads (Figure 3-262) (Chataigne 1886; The Union Republican 1882:3). Around the turn of the twentieth century, the C&O Railroad Company constructed a new railroad track that extended from near Dock Street northwest to Main Street Station. In doing that, the new tracks bisected the 1700 block of Cary Street, and the landscape of that lot changed entirely. By 1905, only two buildings associated with the Crump & West Company survived, the office and the coal shed, and the buildings that once housed the neighboring paper mill and the rag warehouse were no longer extant (Figure 3-263) (Sanborn Map Company 1905b).

Around 1909, the Virginia Bonded Warehouse Corporation bought a lot of land just north of E. Cary Street from Crump & West Company property between 17th and 18th Streets and built a large five-story brick building as their new headquarters. This company boasted about their new building "a capacity of 1,250,000 cubic feet… and has a splendid frontage of 130.25 feet on the Southern Railway" (Figure 3-264) (Richmond Times-Dispatch 1909). Just four years later, Charles H. West sold the Crump & West property south of E. Cary Street to the Virginia Bonded Warehouse Corporation for $9,215 (CRDB 222B:298). At this time, the company tore down the previous infrastructure associated with the Crump & West Coal Company and in 1914 constructed the five-story brick building to be used as their office. This triangular-shaped building currently stands at the intersection of E. Cary and 17th Streets and was built to mirror the original and larger 1909 Virginia Bonded Warehouse Corporation warehouse just to its north (Figure 3-265) (Sanborn Map Company 1905a, 1925; Richmond Times-Dispatch 1916).

Virginia Bonded Warehouse Corporation operated out of these two buildings that flank the 1700 block of E. Cary Street until the late 1950s; in 1962, Philip Morris, Inc. acquired the two buildings and the land on which they stand (CRDB 601A:145, 609D:800). Philip Morris, Inc. is a tobacco company that has roots in London dating to the mid-nineteenth century and was "incorporated in Virginia under the name Philip Morris & Co., Ltd, Inc. By the end of the [1920s] the company has begun to manufacture cigarettes in its factory in Richmond, Virginia" (Philip Morris International Management SA 2017). Over the next several decades, the company facilities in Richmond expanded to include several warehouses and factories across south Richmond (Hill Directory Co. 1960, 1965). After three decades of ownership, Philip Morris sold the lot on the south side of Cary Street that contains the building at 1717–1721 E. Cary Street in 1994 (CRDB 405:136). The 0.21-acre lot changed hands several times between 1994 and 2016, when it was sold to 1717 Partners, LLC (CRDB 98-0011207, 03-048414, 16-18882). The building is currently owned by Capital One Financial Corp. who renovated the building in conjuction with 1717 Partners, LLC and occupy the first two stories; the remaining space is being planned as an incubator for startup businesses (Richmond Times-Dispatch 2017; Startup Virginia 2018).

3.21.2 Architectural Description

3.21.2.1 Primary Resource Interior

The Philip Morris Tobacco Storage Warehouse building is a five-story, 10-bay, trapezium-shaped, utilitarian industrial building constructed around 1914 (Figure 3-266). The building sits on a continuous foundation supporting an indiscernible structural system sheathed in brick laid in a six-to-one common bond (Figure 3-267). Each elevation features a series of arched recesses that emphasize each bay. The central bay of the southeast elevation contains a circular metal cap between each story that may be former fire alarm bells. The warehouse is covered by an asphalt-clad flat roof lined with a low brick parapet with metal coping on all elevations. A corbelled brick cornice is situated beneath the parapet. Chimneys or flues were not observed during the survey.

FIGURE 3-266: SITE PLAN OF THE PHILIP MORRIS LEAF STORAGE WAREHOUSE

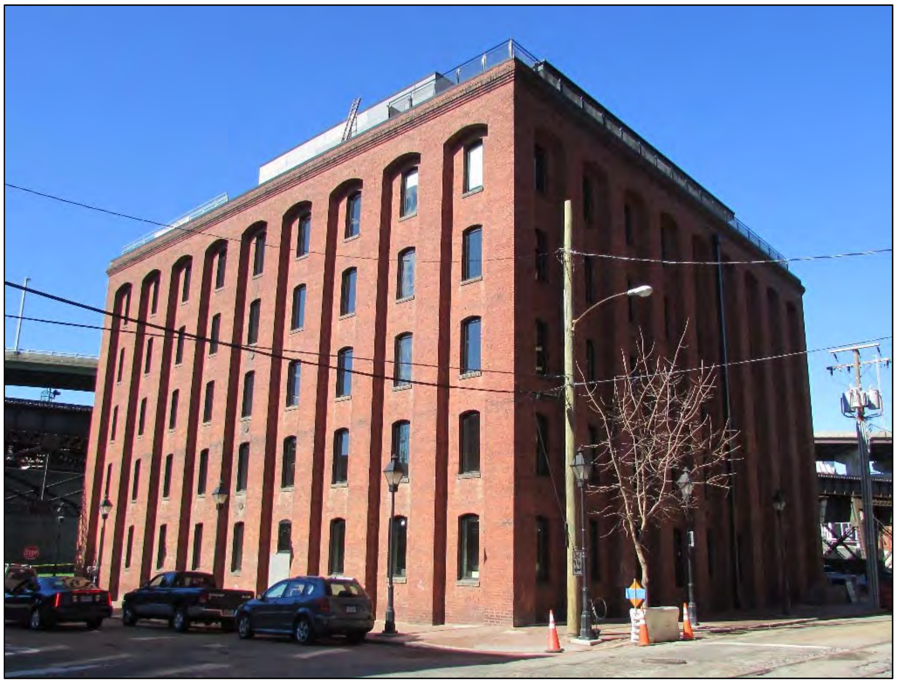

FIGURE 3-267: EAST ELEVATION OF THE PHILIP MORRIS STORAGE WAREHOUSE

The current primary entrance is located in the north half of the northwest elevation. It is filled with a single-leaf, glass door with a single, commercial-style sidelight. A flat, metal awning set above the door features a metal "1717" sign (Figure 3-268). A secondary entrance, filled with a single-leaf, metal door with an arched, metal-frame transom set above, is off-centered in the southeast elevation. Set within larger window openings, the building contains replacement single-light, metal-frame, fixed windows. The window openings feature segmental arches and stone sills.

A six-story, flat-roof projection is centered on the northwest elevation providing roof access and is clad in the same materials and in the style as the core of the building (Figure 3-268). Fenestration in this area of the building has been recently replaced by large, commercial-style, metal-frame windows that are horizontally divided by thick metal strips.

A circa-2017, one-story, roof-top addition is situated in the western three-quarters of the building while the eastern quarter is lined with a metal-and-glass rail for a roof-top balcony (Figure 3-269). The addition is clad in an indeterminate tile and covered by a flat roof with metal coping. This addition projects along the north side of the brick projection on the northwest elevation and features large, commercial-style, metal-frame windows that are horizontally divided by thick metal strips.

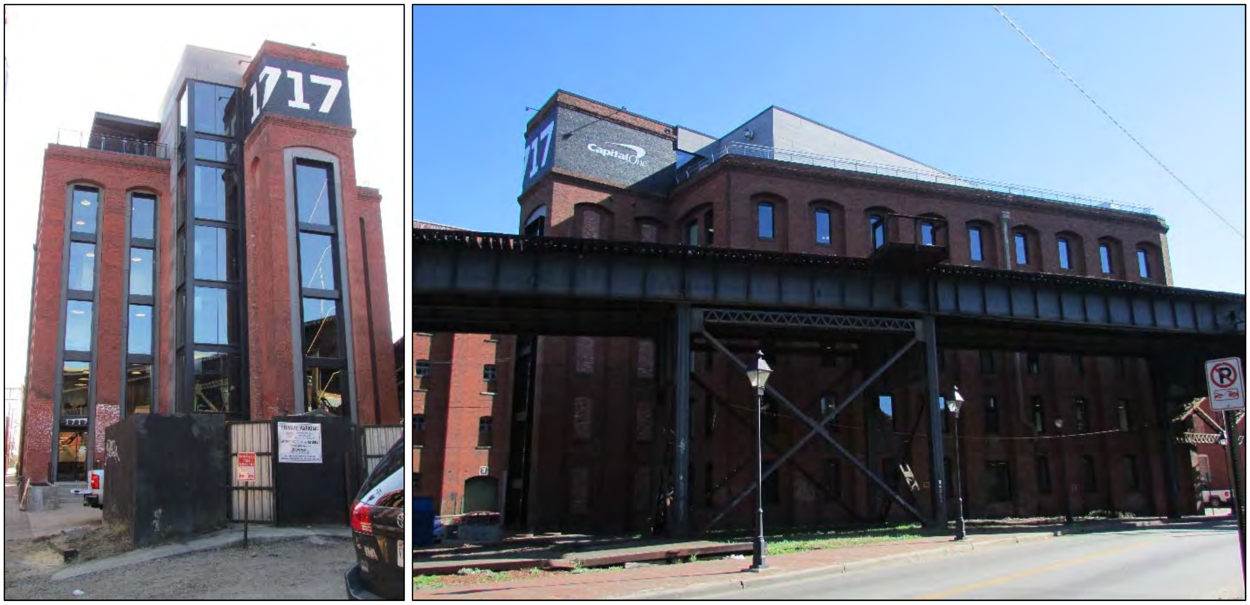

FIGURE 3-268: SOUTHWEST ELEVATION (LEFT) AND NORTHWEST ELEVATION (RIGHT) OF THE PHILIP MORRIS STORAGE WAREHOUSE

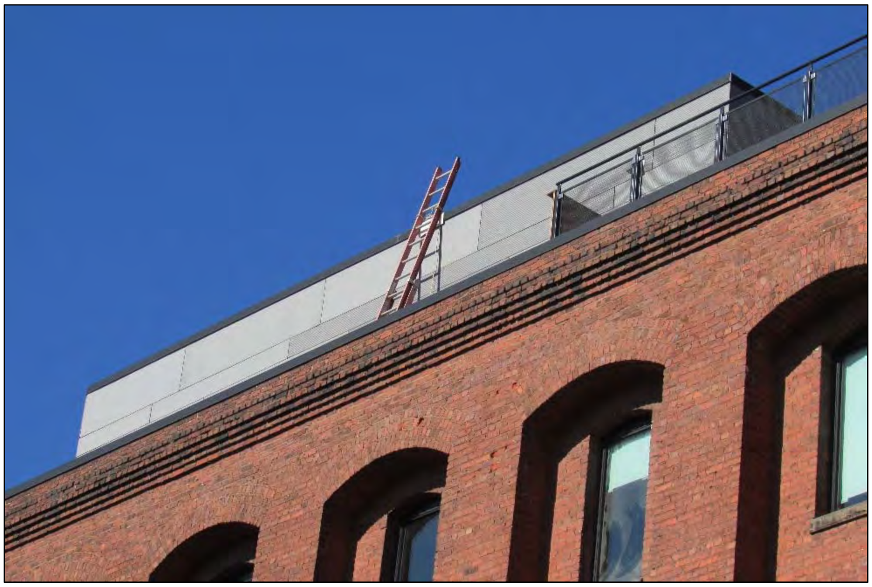

FIGURE 3-269: DETAIL VIEW OF ROOFTOP ADDITION, LOOKING WEST

3.21.2.2 Primary Resource Interior

Interior access was not obtained during the time of the current survey. However, recent images of the interior have been made electronically available through the Startup Virginia website (Startup Virginia 2018). They show a combination of exposed brick and drywall walls, a mix of poured-concrete and wood flooring, and exposed wood posts and beams (Figure 3-270) (Startup Virginia 2018). Work spaces appear to be divided by glass walls.

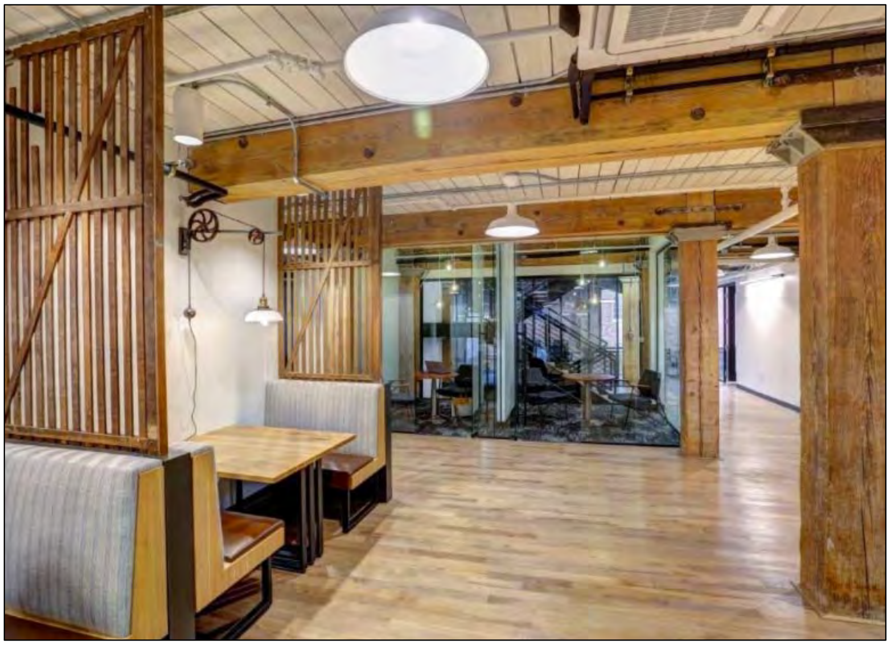

FIGURE 3-270: INTERIOR VIEW OF THE PHILIP MORRIS TOBACCO STORAGE WAREHOUSE (STARTUP VIRGINIA 2018)

3.21.3 NRHP Evaluation

The Philip Morris Tobacco Storage Warehouse at 1717–1721 E. Cary Street is a five-story, brick commercial building constructed in 1914 by the Virginia Bonded Warehouse Corporation. This warehouse is appropriately situated within a commercial and industrial section of Richmond just north of the James River. The resource has never been moved, and the area in which it is located remains light industrial and commercial in character, providing it with a high level of integrity of location, setting, and association. Recently, the building has undergone substantial renovations including interior remodeling for office and work spaces, a large-scale addition, and the replacement of all fenestration. Therefore, the resource has a low to moderate level of integrity of feeling, design, workmanship, materials, and design.

Although the Philip Morris Building at 1717–1721 E. Cary Street is associated with commerce in Richmond during the first, second, and third quarters of the twentieth century, its specific contribution to that trend is not noteworthy. As such, it is recommended not eligible under Criterion A.

For a resource to be eligible for listing in the NRHP under Criterion B, it must be associated with an important individual within a specific historic context or they must be considered significant within their profession or group (Shrimpton et. al 1990). Although the people who have been associated with this resource since it was constructed were involved in Richmond commerce, these individuals are not known to have made lasting significant contributions to its history or to commerce practices in the region. Therefore, the resource is recommended not eligible for the listing under Criterion B.

This warehouse building, constructed in 1914, was modeled in the same design as its larger precursor just north of E. Cary Street (127-0344-0328). In an earlier survey of this resource, it was stated that: "this building stands as an excellent example of the sparingly ornamented yet functionally designed commercial structure of the turn-of-the-century that served as both the forerunner and inspiration for the International style" (DHR 1980). Although it is a good surviving example of a sparingly ornamented commercial building of the first quarter of the twentieth century, it does not seem to have inspired many elements of the International Style. According to Melina Bezirdjian and Lena Sweeten McDonald in New Dominion Virginia, Architectural Style Guide, defining characteristics of this style include: focus on volume not mass, conspicuous lack of ornament, smooth textures, asymmetrical elevation, light metal or concrete frames, open plans, ribbon windows, flat roofs, large expanses of glass, and use of stilts or piers at ground level (Bezirdjian and McDonald 2014:31). Although this Philip Morris Tobacco Storage Warehouse does exhibit a few of those characteristics, such as a flat roof and lack of ornamentation, it seems to lack many of the other character-defining features and suffers from a loss of historic integrity due to large-scale additions and renovations. Instead, both buildings constructed by the Virginia Bonded Warehouse Corporation in 1909 and 1914 seem to closely reflect the neighboring turn-of-the-twentieth-century warehouses that line the streets of the present-day Shockoe Valley and Tobacco Row Historic District (127-0344). The Philip Morris tobacco Storage Warehouse is recommended not eligible for the NRHP under Criterion C. As an architectural resource, the Philip Morris Tobacco Storage Warehouse was not evaluated under Criterion D.

In sum, the Philip Morris Tobacco Storage Warehouse is **recommended not eligible for listing in the NRHP under Criteria A–C.** The resource was constructed during the period of significance (1737–1930) of the Shockoe Valley and Tobacco Row Historic District (127-0344) and continues to reflect the architectural trends within the district, despite being recently altered. The resource is **recommended as contributing to the Shockoe Valley and Tobacco Row Historic District (127-0344).**

4 SUMMARY AND RECOMMENDATIONS

The DC2RVA Project Team conducted an intensive-level architectural survey of a total of 52 resources, 21 of which are presented in the current report. The DC2RVA project is being completed under the auspices of the FRA in conjunction with the DRPT. Because of FRA's involvement, the undertaking is required to comply with the NEPA and Section 106 of the National Historic Preservation Act of 1966, as amended. The Project is being completed as DHR File Review #2014-0666.

Of the 21 resources detailed in this report, the DC2RVA Project Team are recommending 15 as individually eligible for the NRHP (Table 4-1). Listed in numerical order, they are as follows:

Phoenix Mill (100-0277), Hannah P. Clark House/ Enyedi House (029-5741), Jackson Shrine (016-0092), Woodford Freight & Passenger Depot (016-0222), First Woodford Post Office (016-0223), Glenwood House (016-0224), Coghill-Jeter Store (016-0286), Milford Historic District (016-5136), Excelsior Industry of Caroline County Historic District (016-5165), Doswell Depot and Tower (042-5466), Tri-County Bank–Doswell Branch (042-0469), Doswell Historic District (042-5448), Robert Stiles Building/ Main Building of the Laurel Industrial School (043-0292-0001), Railroad YMCA (127-0344-0123), and Winfree Cottage (127-6129). Of those, one resource (016-0092) is recommended as contributing to the Fredericksburg and Spotsylvania County Battlefields National Military Park Historic District (111-0147), one resource (016-0270) is contributing to the Milford Historic District (016-5136), two resources (016-0222 and 042-5466) are recommended as contributing to the RF&P Railroad Historic District (500-0001), four resources (042-5466, 042-0469, and 042-0470) are recommended as contributing to the Doswell Historic District (042-5448), and one resource (043-0292-0001) is recommended as contributing to the Laurel Industrial School Historic District (043-0292).

During the current survey, the DC2RVA Team found that the remaining six resources (016-0470, 016-5129, 042-0468, 042-0470, 043-5636, and 127-0197) are recommended as not individually eligible for the NRHP with the Doswell Inn (042-0468) and Darnell Store (042-0470) contributing to the Doswell Historic District (042-5448), the Milford State Bank (016-0270) contributing to the Milford Historic District (016-5136), and the Philip Morris Leaf Storage Warehouse (127-0197) contributing to the Shockoe Valley and Tobacco Row Historic District (127-0344) (Table 4-1).

TABLE 4-1: TABLE OF SUMMARY AND RECOMMENDATIONS OF THE ARCHITECTURAL RESOURCES PRESENTED IN THE CURRENT REPORT

DC2RVA Corridor Area	DHR ID	Name/ Description	City/ County	Date / Time Period	Phase II Recommendation
2	100-0277	Phoenix Mill, 3642 Wheeler Avenue	City of Alexandria	ca. 1776	Eligible under Criteria A & C
2	029-5741	Hannah P. Clark House/ Enyedi House, 10605 Furnace Road	Fairfax County	ca. 1839; 1986–2011	Eligible under Criterion B & Criteria Consideration B & G
4	016-0092	The Jackson Shrine, 12019 Stonewall Jackson Road	Caroline County	1828	Eligible Under Criteria A & C; Contributing to the Fredericksburg and Spotsylvania County Battlefields National Military Park HD
4	016-5129	Woodford Historic District	Caroline County	1874–1969	Not Eligible
4	016-0223	First Woodford Post Office, Lake Farm Road	Caroline County	1874–1875	Eligible under Criterion C and Criteria Consideration B
4	016-0222	Woodford Freight & Passenger Depot, Woodford Road	Caroline County	ca. 1900	Eligible under Criterion C and Criteria Consideration B

ABSTRACT

Dovetail Cultural Resource Group (Dovetail), as a member of the Washington, D.C. to Richmond Southeast High Speed Rail (DC2RVA) Project Team and on behalf of the Virginia Department of Rail and Public Transportation (DRPT), conducted an intensive-level architectural survey of the DC2RVA Project (the Project). The proposed Project is being completed under the auspices of the Federal Railroad Administration (FRA) in conjunction with DRPT. Because of FRA's involvement, the undertaking is required to comply with the National Environmental Policy Act (NEPA) and Section 106 of the National Historic Preservation Act of 1966, as amended. The Project is being completed as Virginia Department of Historic Resources (DHR) File Review #2014-0666.

Dovetail and the DC2RVA Team completed 17 reports detailing the results of the reconnaissance-level survey and coordinated the results with the DHR between 2015 and 2018. Subsequent analysis included an investigation-level evaluation of architectural resources recommended potentially eligible for listing in the National Register of Historic Places (NRHP) during the reconnaissance-level survey that are located within the Preferred Alternative of the Project. The goals of this investigation were to: first, document the architectural and landscape features of the properties; second, gather archival data on the properties; and third, examine the physical and historical information collected within the appropriate context(s) to properly evaluate each property under established criteria for the NRHP. The fourth goal of this investigation was to propose NRHP boundaries for any property should it be recommended eligible for listing. Work on this project was conducted in 2017 and 2018, in accordance with relevant state and federal regulations as part of the compliance process established in Section 106 of the National Historic Preservation Act of 1966, as amended (36 CFR 800).

In total, the DC2RVA Project Team surveyed 52 historic architectural resources at the evaluation level, 18 of which are detailed in the current report (the remaining 34 resources are presented in two other intensive-level survey reports, Report A and Report B). Of those 18 resources, the DC2RVA Project Team is recommending that 11 are individually eligible for listing in the NRHP (042-0113, 043-0694, 111-0013/ 111-0132-0508, 111-0067/ 111-0132-0505, 111-0132-0147, 111-0132-0458, 166-5073-0010, 166-5073-0024, 127-0344-0102, 127-5818, and 127-6883) while seven (042-0420, 042-0557, 042-5048, 043-0693, 100-5341, 111-0038/111-0132-0509, and 166-5073) are recommended not individually eligible.

INTRODUCTION

Dovetail Cultural Resource Group (Dovetail), on behalf of the Virginia Department of Rail and Public Transportation (DRPT), conducted an intensive-level architectural survey of resources along the Preferred Alternative of the Washington, D.C. to Richmond Southeast High Speed Rail (DC2RVA) Project (the Project). The proposed Project is being completed under the auspices of the Federal Railroad Administration (FRA) in conjunction with DRPT. Because of FRA's involvement, the undertaking is required to comply with the National Environmental Policy Act (NEPA) and Section 106 of the National Historic Preservation Act of 1966, as amended. The Project is being completed as Virginia Department of Historic Resources (DHR) File Review #2014-0666.

The FRA and DRPT propose passenger rail service and rail infrastructure improvements in the north-south travel corridor between Washington, D.C. and Richmond, VA. These passenger rail service and rail infrastructure improvements are collectively known as the DC2RVA Project. The Project will deliver higher speed passenger rail service, increase passenger and freight rail capacity, and improve passenger rail service frequency and reliability in a corridor shared by growing volumes of passenger, commuter, and freight rail traffic, thereby providing a competitive option for travelers going between Washington, D.C. and Richmond and those traveling to and from adjacent connecting corridors. The Project is part of the larger Southeast High Speed Rail (SEHSR) corridor (Figure 1-1), which extends from Washington, D.C. through Richmond, VA; and from Richmond continues east to Hampton Roads (Norfolk), VA, and south to Raleigh, NC; and Charlotte, NC, and then continues west to Atlanta, GA, and south to Florida. The Project connects to the National Railroad Passenger Corporation (Amtrak) Northeast Corridor (NEC) at Union Station in Washington, D.C.

The purpose of the SEHSR program, as stated in the 2002 Tier I Final Environmental Impact Statement (EIS) completed for the full SEHSR corridor, is to provide a competitive transportation choice to travelers within the Washington, D.C. to Charlotte travel corridor. The purpose of the current Washington, D.C. to Richmond SEHSR project described here is to fulfill the purpose of the SEHSR Tier I EIS within this segment of the larger SEHSR corridor. The Project, by increasing rail capacity and improving travel times between Washington, D.C. and Richmond, will improve passenger train frequency, performance and reliability in the corridor, enabling intercity passenger rail to be a competitive transportation choice for travelers between Washington, D.C. and Richmond and beyond.

Given FRA's funding involvement and permitting through various other federal agencies, the DC2RVA project is required to comply with Section 106 of the National Historic Preservation Act of 1966, as amended, and the Act's implementing regulations under 36CFR800. Additionally, all cultural resource work was designed by DRPT and Dovetail to comply with the Virginia

Antiquities Act (Code of Virginia § 10.1-2300) and guidelines and regulations promulgated by the DHR as necessary.

Previous Project studies included a reconnaissance survey of all alternatives under consideration, completed between 2015 and 2017. In September 2017, a DRPT-recommended Preferred Alternative was presented in the Draft EIS. DRPT's recommended Preferred Alternative was approved by the Commonwealth Transportation Board for recommendation to FRA in December 2017. Additional reconnaissance architectural study was then completed on any resources within the Preferred Alternative that were not the subject of identification-level study during the initial survey work (Moss and Barile 2018). Following this, intensive-level architectural studies were completed for above-ground resources determined to be potentially eligible by the DHR within the area of potential effects (APE) of the Commonwealth's recommended Preferred Alternative. The current report focuses on the results of the intensive-level investigations completed by Dovetail on 18 of the 52 architectural resources that comply with these study parameters, organized in the body of this report in geographical order from north to south. The remainder of the resources are detailed in separate reports.

1.1 PROJECT LOCATION

The Washington, D.C. to Richmond corridor spans approximately 123 miles along the existing rail corridor owned by CSX Transportation (CSXT) between Control Point RO (milepost [MP] CFP 110) in Arlington, VA, to the CSXT A-Line and S-Line junction at MP A-11 in Centralia, VA (Chesterfield County). For the purposes of conceptual engineering and environmental planning, the DC2RVA corridor has been subdivided into six Areas that correspond with improvements and alternatives, and as such have been named and numbered from north to south (Figure 1-2). At the northern terminus in Arlington, VA, the Project limit for infrastructure improvements ends at the southern approach to Long Bridge, a double-track rail bridge taking the rail corridor over the Potomac River; however, the northern terminus of Union Station in Washington, D.C. is used for ridership and revenue forecasting, as well as service development planning within the Project corridor. The southern terminus in Centralia is the junction of two CSXT routes that begin in Richmond and rejoin approximately 11 miles south of the city.

Proposed improvements are along CSXT-owned track and right-of-way, generally parallel to the I-95 corridor between northern Virginia and Richmond. From north to south, the project travels through the following counties and cities:

- Arlington County
- City of Alexandria
- Fairfax County
- Prince William County
- Stafford County
- City of Fredericksburg
- Spotsylvania County
- Caroline County
- Hanover County
- Henrico County
- City of Richmond
- Chesterfield County

In Arlington, the Project connects to existing CSXT track extending across the Potomac River on the Long Bridge into Washington, D.C. and Union Station, the southern terminus of Amtrak's Northeast Corridor (NEC). At Centralia, the Project connects to both the Richmond to Raleigh segment of the SEHSR corridor and the Richmond to Hampton Roads segment of the SEHSR corridor.

The Washington, D.C. to Richmond segment is an integral part of the overall Washington, D.C. to Charlotte SEHSR corridor and provides a critical link between high speed intercity passenger service from Boston to Washington, D.C. and the southeastern United States.

1.2 PROJECT DESCRIPTION

The DC2RVA project will include specific rail infrastructure improvements and service upgrades intended to improve the travel time, service frequency, and on-time performance of passenger trains operating between Washington, D.C. and Richmond, VA. Specific improvements to the existing rail infrastructure between Arlington, VA, and Centralia, VA include:

- Corridor-wide upgrades to existing track and signal systems to achieve higher operating speeds, including curve realignments, higher-speed crossovers between tracks, passing sidings, and grade crossing improvements.
- Corridor-wide improvements to train operating capacity to achieve higher passenger train service frequency and reliability, including an additional main track along most of the corridor, and additional controlled sidings, crossovers, yard bypasses and leads, and other capacity and reliability improvements at certain locations.
- Station and platform improvements for Amtrak and Virginia Railway Express (VRE) stations.

The Tier II EIS being completed for the Project will assess the environmental impacts of these improvements and identify ways to avoid, minimize, or otherwise mitigate such impacts.

Studies in support of the Project address passenger and freight rail operations and service between Union Station in Washington, D.C. and Richmond and beyond, but the Project does not include physical improvements to the Long Bridge across the Potomac River or to rail infrastructure within Washington, D.C. Other projects will address improvements to the rail infrastructure north of Arlington and south of Centralia along the SEHSR corridor.

1.3 CURRENT STUDY

The DC2RVA Team has been conducting reconnaissance-level architectural studies for the entire 123-mile DC2RVA corridor since December 2014. The initial findings were detailed in 17 reports. Between January 29, 2016, and March 1, 2017, DHR concurred with the DC2RVA team's recommendations on these 17 reports. In addition, subsequent reconnaissance-level architectural studies were completed in areas where the limits of disturbance have been modified since the original work, and the results have been summarized and sent to the DHR (Moss and Barile 2018). Through all efforts, it was determined that 52 resources within the Commonwealth's Preferred Alternative should be the subject of intensive study to determine NRHP eligibility (Table 1-1). After communication with the DHR in April 2018, it was determined that two (111-0132-0507 and 166-0033) of the 52 resources should be recommended not eligible as part of the reconnaissance-level survey, and intensive-level survey should be conducted on the remaining 50 resources (Marc Holma, personal communication 2018). As such, the number of intensive-level studies was reduced. This report includes the results of the intensive-level investigations on 18 of the 52 resources (Report C) (see Figure 1-3 through Figure 1-9). The remaining 34 resources are presented in two associated reports (Report A and Report B).

Documentation and research for this project were conducted in accordance with relevant state and federal guidelines as part of the compliance process established in Section 106 of the National Historic Preservation Act of 1966, as amended (36 CFR 800). Fieldwork and archival research was completed between November 2017 and April 2018. During this period, DHR records were consulted and various municipal and private repositories, including land and tax records, as well as historical and genealogical societies, were visited. A background literature and records review of the architectural APE at the DHR was conducted as part of the reconnaissance survey completed during the previous architectural studies for the Project (e.g., Anderson and Staton 2016; Staton and Lesiuk 2015, etc.).

2

METHODOLOGY

The architectural investigation for the Project was conducted to examine any historic buildings, objects, or districts over 48 years in age for NRHP eligibility concurred by the DHR to be potentially eligible for listing in the NRHP (the resource age cut-off date was established based on the schedule for the larger environmental document). Each potentially eligible resource was evaluated with regard to NRHP Criterion A, for its association with events that have made a significant contribution to the broad patterns of our history; Criterion B, for its association with people significant in our nation's history; Criterion C, for its embodiment of distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or possess high artistic values. As part of the current survey, these architectural resources were not evaluated under Criterion D for their potential to yield information important in history. Additionally, each resource's integrity was addressed through seven aspects or qualities: location, design, setting, materials, workmanship, feeling, and association. Criteria considerations were taken into account only where necessary. This report meets the standards set forth by the DHR's architectural survey manual (DHR 2017).

Field recordation included an in-depth physical examination of each resource, including the interiors when accessible; digital photographs documenting the primary elevation, oblique angles, occasionally interiors, and general setting; detailed site plans of the property and floor plans were prepared when applicable. Archival research on each resource was conducted at land record repositories for various municipalities, historical and genealogical societies, online repositories of historic records, local libraries, and the Library of Virginia.

After the architectural fieldwork, research, and evaluation was completed, the Project Team prepared separate Virginia Cultural Resource Information System (V-CRIS) forms and accompanying documentation for each recorded property in accordance with DHR policies and practices. Each V-CRIS packet includes a V-CRIS form, site plan, set of hard-copy color photographs, and a CD of digital photos for each property to meet with the current DHR standards (DHR 2017).

3 SURVEY RESULTS

Dovetail completed intensive-level architectural investigations on 52 resources potentially eligible for the NRHP, 18 of which are detailed in this chapter. The remainder of the resources are examined in separate reports.

3.1 EAST ROSEMONT HISTORIC DISTRICT (100-5341)

The East Rosemont Historic District (100-5431) is an early-twentieth-century neighborhood intended as the fourth expansion of the turn-of-the-century, planned-suburban neighborhood known as Rosemont (100-0137) in Alexandria, Virginia. The grid-pattern neighborhood is bounded by the CSXT rail line (formerly the Richmond, Fredericksburg & Potomac rail line) to the south and southeast, Hooff's Run and Rosemont Historic District to the west, the north side of Walnut Street and a subdivision known as Rosemont Park to the north, and Braddock Road to the northeast (Figure 3-1).

3.1.1 Historic Context

The area in which East Rosemont Historic District lies was historically within the boundaries of the District of Columbia; however, by 1846, this side of Washington, D.C. was retroceded back to Virginia, becoming part of Alexandria County and then Arlington County by 1920. The area of study was annexed into the City of Alexandria in 1915, prior to its development (City of Alexandria Office of Historic Preservation 2017). The East Rosemont neighborhood stems from the NRHP-listed Rosemont Historic District (100-0137) which is located immediately to the west and encompasses 84 acres of planned, well-landscaped, residential lots (Maxwell and Massey 1992). Development of Rosemont began in the 1890s after the subdivision was platted by the Spring Park Improvement Company in hopes of producing a City Beautiful-inspired suburb (City of Alexandria Office of Historic Preservation 2017). However, construction did not begin until 1908 when the Rosemont Development Corporation was formed.

As in most areas in the United States at the time, suburban development was directly related to transportation routes, especially railroad lines, trolley lines, and overland routes. The growth and development of the Rosemont and East Rosemont districts was partially tied to the success of the Washington, Alexandria, and Mount Vernon Electric Railway, which ran north to south along what is now Commonwealth Avenue providing local transportation from Mount Vernon, through Alexandria, and into Washington, D.C. beginning in 1892 (Figure 3-2) (City of Alexandria Office of Historic Preservation 2017). Multiple stops were located along Commonwealth Avenue in the area between the tracks, what is now the median, and trains ran frequently from the early morning to late evening (Ness 2008). Also related to this suburban development was the opening of the Alexandria Union Station in 1905 and the Potomac Yard in 1906, bringing workers in need of local and affordable housing (City of Alexandria Office of Historic Preservation 2017).

FIGURE 3-2: 1921 OVERVIEW SANBORN MAP OF THE ROSEMONT AREA (SANBORN MAP COMPANY 1921) (NOT TO SCALE)

Another influence in suburbanization at this time was the City Beautiful Movement. In the 1890s and early years of the twentieth century, Americans struggled with social unrest, economic depression, and overcrowded urban centers (Rose 1996). Architect and planner Daniel Burnham, a leading proponent of the movement, suggested that a "reform of the landscape… to complement the burgeoning reforms in other areas of society" would in turn spark civic loyalty and general health and wellness within the cities (Hines 1974:155). In conjunction with the expansion of public transportation, "advances in city planning associated with the City Beautiful movement began to influence both the location and design of residential subdivisions" (Ames and McClelland 2002:34). Although East Rosemont appears to follow trends of the earlier planned rectilinear Rosemont suburb with a modified grid-iron plan that was centered around a form of transportation, it also embodies several of the earlier City Beautiful movement principles such as "a general plan of development, specifications and standards, and the use of deed restrictions [which] became essential elements used by developers and designers to control house design, ensure quality and harmony of construction, and create spatial organization suitable for fine homes in a park setting" (Ames and McClelland 2002:37–41).

Construction in East Rosemont began around 1918 shortly after it was platted by the Rosemont Development Company, Incorporated (Inc.) on smaller lots than those in Rosemont; however, room was still left for front and rear yards (City of Alexandria Deed Book [CADB] 67:152–153; Maxwell and Massey 1992; United States Department of Agriculture [USDA] 1915). Three restrictions were applied to the lots, which all were utility- or infrastructure-related. Lots in the initial platting were located in blocks between Dick (now Oak) Street to the north, Washington Avenue to the west, and south side of Linden Street to the south, with the RF&P Railroad to the west, and they were the first to be subdivided and developed. They measured between 4,000 and 4,600 square feet compared to the average 8,435 square feet of the first section of Rosemont to the west.

A different architectural approach to houses in East Rosemont was taken as well, as they were aimed more at the working class such as the local railroad and industrial workers who worked north, east, and south of Rosemont (Levine et al. 1983). They were generally smaller structures of frame construction, less expensive than anything west of the streetcar line and Commonwealth Avenue (Levine et al. 1983). Stylistically, the dwellings were initially constructed as "middle-of-the-range examples of early-twentieth century-styles" with a "conservative, solidly middle-class approach to each style represented," similar to the first three sections of Rosemont but at a lesser scale (Maxwell and Massey 1992). Research did not reveal any particularly important architects or builders for this section of East Rosemont. It is likely that various development companies and homeowners utilized influential plan or pattern books, popular magazines, mail-order catalogs, or pre-cut house catalogs of the period and adapted them to reduce cost (Alexandria Library: Special Collections Records n.d.; Ames and McClelland 2002:52–56).

A 1921 Sanborn Fire and Insurance Map indicates that all dwellings in East Rosemont were frame and one- to two-stories in height (Sanborn Map Company 1921). In the center of the north side of Block 343, bounded by Dick Street (now Oak Street), Spruce Street, Walnut Street, and Washington Avenue (now Commonwealth Avenue), is the only two-story, brick-veneered dwelling with a large, frame, accessory building. The remainder are frame dwellings, signaling the more working-class atmosphere for the neighborhood, and they stand in contrast to the original Rosemont section which mainly used masonry construction by this time (Figure 3-3). Other commercial or civic buildings constructed by 1921 included auto-related buildings and a post office (Sanborn Map Company 1921).

Initially, Hooff's Run, a small waterway which runs northwest to south on the east side of Commonwealth Avenue, was left undeveloped. By the 1940s, the waterway had been partially infilled, most likely due to problems such as trash disposal, insect breeding, and disease (Cressey 1995; Levine et al. 1983). The electric railway terminated service in 1932 after continuous decline in ridership due to cheaper public vehicular transportation (Ness 2008). In 1946, Washington Avenue was renamed Commonwealth Avenue and approximately 75 percent of the lots in the section were built upon. By 1959, townhouses were constructed in all the open lots along the south side of E. Linden Avenue and in "Block 629," the southern triangular tip south of E. Linden Street (Figure 3-4) (Levine et al. 1983). Mt. Vernon and Rosemont avenues were extended east into "Block 629" to provide access to the townhouses constructed there.

3.1.2 Architectural Description

East Rosemont Historic District is a planned, suburban neighborhood comprising approximately 30 acres platted in Alexandria, Virginia in 1918. The oldest portion of the subdivision is primarily laid out in a grid-iron plan with E. Walnut, E. Maple, and E. Linden streets extending east from Commonwealth Avenue towards Mt. Vernon Avenue that run parallel with the railroad tracks. Little Street, formerly called Spruce Street, runs north-south connecting Linden through Walnut streets and further north to the Rosemont Park subdivision. All blocks are lined with a poured-concrete, public sidewalk with a raised concrete curb. Grassy median strips are situated between most sidewalks and curbs and are dotted by matured deciduous trees with some small plantings also observed in these areas. The circa-1950s portions of E. Linden Street and Mt. Vernon Avenue, as well as E. Rosemont Avenue containing townhouses, have on-street parking, and feature alleyways that run behind the multi-family buildings. A late-twentieth-century park and children's playground, known as Blue Park Playground, is located on the west side of the townhouses on Mt. Vernon Avenue.

A majority of the single-family dwellings are similarly set back on flat landscaped lots measuring an average of 4,300 square feet and covered primarily in manicured lawns (Figure 3-5). However, most single-family dwelling on the south side of E. Linden Street are set high on a hill and feature rusticated stone, wood, or concrete-block retaining walls along the north side (i.e., 33 E. Linden Street through 103 E. Linden Street). Occasionally in other areas of the subdivision, lots are fronted by a knee-high, retaining wall. Many single-family lots along E. Linden, E. Maple, and E. Walnut streets have a single-vehicle driveway on either side of the dwelling that is accessed from the street; it is rare for a driveway to lead to a corresponding garage (i.e., 101 E. Walnut Street and 100 E. Walnut Street).

Most single-family dwellings are of frame construction, one to two stories in height, range from two to three bays wide, and were built between 1918 and 1941 (Figure 3-6). Architectural styles used are fairly muted and vernacular to the area and class for which they were constructed with elements of the Craftsman, Queen Anne, Colonial and Classical Revival, and Minimal Traditional styles. These subdued characteristics can be observed through porch columns, roof type or eave/ cornice detail, or fenestration. Building forms observed during the survey included central or side passage, Cape Cod, and bungalow. Original exterior materials included wood, asbestos, or aluminum siding; brick veneer; or stucco. However, replacement materials are fairly common. Roof types include gabled or hipped examples, mainly sheathed in asphalt shingles. The gambrel roof type was noted infrequently (i.e., 107 E. Walnut Street). One-and-one-half-story examples feature primarily front-gable or hipped dormers. Chimneys vary in placement and are primarily composed of brick, although some sided and metal flues were observed.

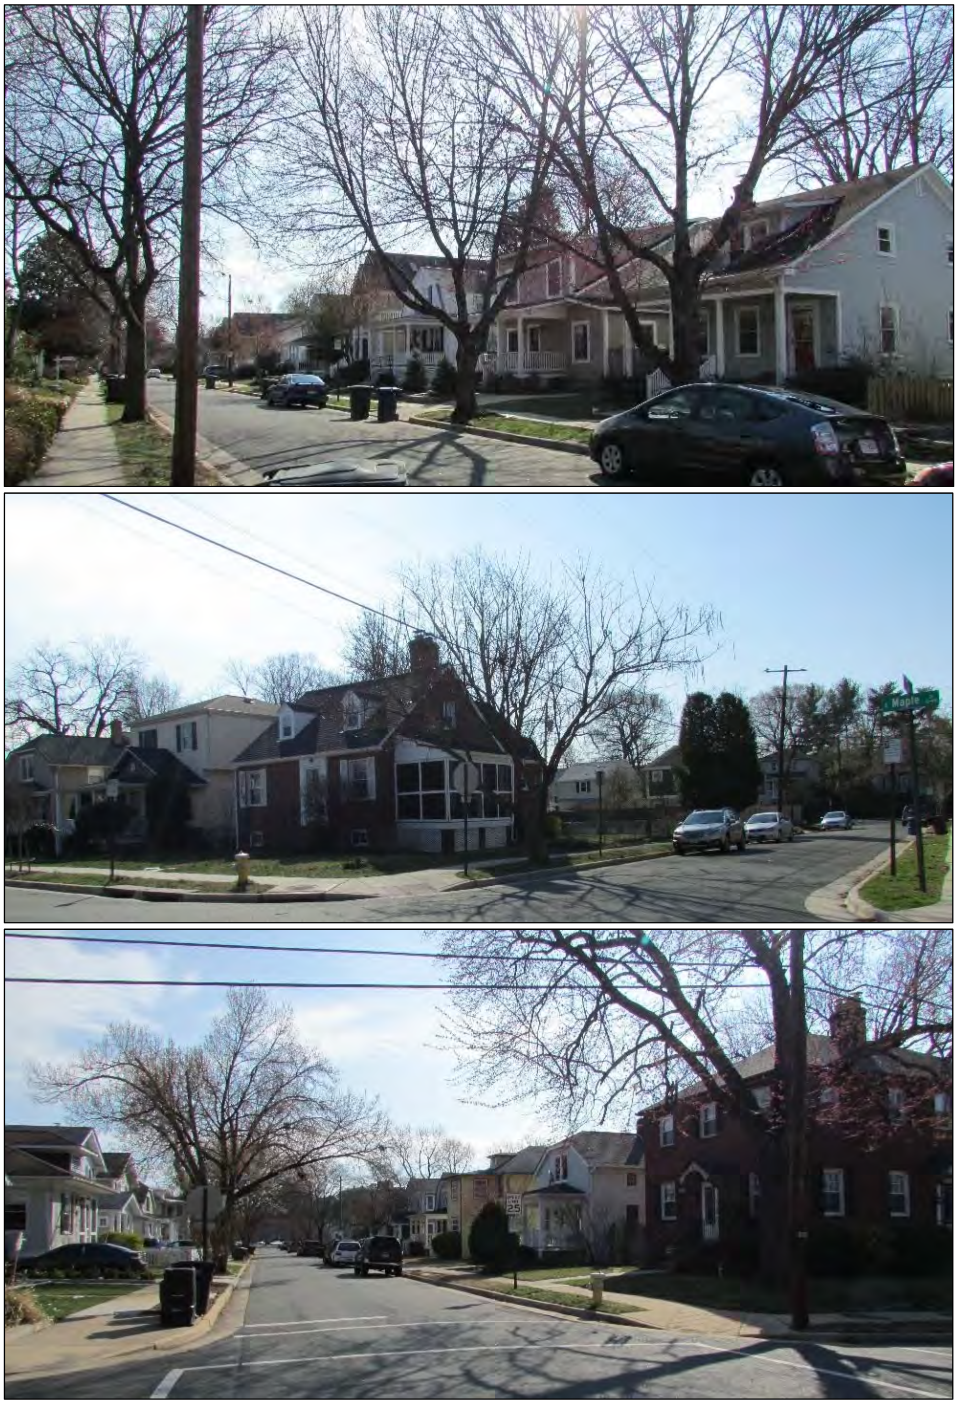

FIGURE 3-5: E. MAPLE STREET, LOOKING NORTHWEST FROM MT. VERNON AVENUE (TOP); INTERSECTION OF E. WALNUT AND LITTLE STREETS FROM LITTLE STREET (MIDDLE); E. WALNUT STREET FROM LITTLE STREET (BOTTOM)

Entrances are typically filled with a single-leaf door of wood or metal with little ornamentation. Windows are primarily single rather than paired and filled with double-hung sashes, a majority of which are replacements. At times, windows are flanked by fixed, wood or aluminum, louvered or paneled shutters. Many single-family dwellings within the subdivision feature a full-width, one-story porch along the façade or, at times, recessed underneath the roof; some have been screened or enclosed as a later modification. Entry porches covered by awnings or pent roofs and uncovered stoops were also observed. It was not uncommon to observe rear additions, some of which were larger in scale than the core of the building (Figure 3-7). The additions are typically one to two stories in height, are partial or full width, and clad in similar exterior materials observed thought the neighborhood.

Other building types within the subdivision include duplexes and townhouses. Unadorned duplexes constructed between 1935 and 1950 at the intersection of E. Maple Street and Mt. Vernon Avenue, and several on Walnut Street, are two stories in height and clad in a common-bond brick veneer. They are covered with low-pitched hipped or flat roofs with parapet walls. Each half of the building features its own separate entrance in the façade, which are similar fenestration to other dwellings in the subdivision. Townhouses in East Rosemont were constructed between 1945 and 1950 in groupings of five to seven units (City of Alexandria 2018). Similar to the duplexes, they are clad in a common-bond brick veneer and each unit features its own entrance in the façade. The older townhouse buildings along the northern end of Mt. Vernon Avenue and E. Linden Street feature decorative brick detailing typical of the Colonial Revival style. Townhouses along Rosemont and the southern end of Mt. Vernon Avenue are covered with a continuous side-gabled roof sheathed in asphalt singles, while those along E. Linden Street and the northern end of Mt. Vernon Avenue are covered by flat roofs (Figure 3-8). Fenestration includes single and paired, double-hung-sash windows varying in one-over-one, vinyl, replacements and six-over-six, wood-frames. Infrequently, metal-frame casement windows were observed in the older townhouses. At times, windows are flanked by fixed, louvered or paneled shutters composed of wood or aluminum. The older townhomes' primary entrances typically feature a Colonial-Revival or Classical-Revival-styled door surround and are accessed by partial-width concrete or brick stoops or full-width porches.

Most of the development in East Rosemont dates between 1918 and 1950, but some infill was noted during the current survey. One example is located at 308 Mt. Vernon Avenue where a circa-2017, two-story, duplex was constructed.

3.1.3 NRHP Evaluation

The East Rosemont Historic District is an early-twentieth-century planned suburban development in Alexandria boasting a mixture of vernacular, middle-class, single- and multi-family housing. It was platted as the fourth section of the neighboring NRHP-listed Rosemont (100-0137) subdivision. Originally, the subdivision was platted for single-family, detached houses. Although no high-style examples are included in the district, vernacular dwellings with elements of the Craftsman, Colonial Revival, and Classical Revival styles were observed, hinting to the social and economic conditions of the residents during that period. The southern portion of the subdivision was developed for multi-family townhomes in the mid-twentieth century, detracting from the original character of the neighborhood and negatively impacting the resource's integrity of design. While only one example of modern infill was observed during the current survey, many dwellings within the district feature over-sized additions and recent modifications that diminish the district's historic integrity of materials, workmanship, feeling, and association. However, the district retains has a high level of integrity in location and setting.

The NPS outlines that a suburban residential neighborhood can be eligible for the NRHP under Criterion A "for their association with important events or patterns in community history or patterns in community history or with groups of residents who collectively made important contributions to the area's prosperity or identity as a place of industry, government, education, or social reform" (Ames and McClelland 2002:95). An excellent example of such a community is the Town of Potomac Historic District (100-0136) in Alexandria, Virginia. Platted in 1894 and developed in 1908, the Town of Potomac Historic District is composed of the multiple subdivisions of Del Ray, St. Elmo, and Abingdon among others, and is listed in the NRHP for its excellent representation of a late-nineteenth- and early-twentieth-century commuter and streetcar suburb (Escherich 1991). Another example of a planned community is the original Rosemont neighborhood. This community was the first planned development in this area and embodies the tenants of turn of the century neighborhood planning, which is still reflected in the streetscapes and neighborhood flow today. Although East Rosemont is also an early-twentieth-century suburban neighborhood developed along the same streetcar railway, it is not a particularly unique or outstanding example of such a subdivision and possesses a relatively low historic integrity. There are no outstanding connections between this district and a notable event. Consequently, the DC2RVA team recommends the East Rosemount Historic District not eligible for the NRHP under Criterion A.

For a suburban development to be eligible for the NRHP under Criterion B, it needs to be "directly associated with one or more individuals who made important contributions to history" (Ames and McClelland 2002:95). The resource is not known to be associated with one significant person from history; therefore, it is recommended not eligible under Criterion B.

According to the NPS Bulletin for the evaluation of historic residential suburbs, "historic residential suburbs often reflect popular national trends in subdivision design… they may also reflect popular architectural styles, housing types, and principles of landscape architecture" (Ames and McClelland 202:95). The Rosemont Historic District (100-0137) is listed in the NRHP under Criteria A and C as a suburban neighborhood developed as a result of "the ever-deepening penetration of the trolley line" in the surrounding areas of Washington, D.C. that "exhibits remarkable cohesiveness and has remained essentially intact" (Maxwell and Massey 1992). The East Rosemont Historic District reflects popular trends in keeping with local subdivision design but is not a good example of its property type. Moreover, many of the buildings within the district exhibit modifications to their original scale and massing, resulting in a different visual aesthetic and building design than originally created. These changes have resulted in a loss of cohesiveness amongst the building's designs that is seen in other, contemporary planned neighborhoods. Research did not identify a well-renowned architect, builder, or developer is associated with the district. Therefore, the East Rosemont Historic District is recommended not eligible for the NRHP under Criterion C. As an architectural resource, it was not evaluated under Criterion D.

In sum, the East Rosemont Historic District is **recommended not eligible for the NRHP under Criterion A–C.**

3.2 CHANCELLOR HOUSE (111-0013/ 111-0132-0508)

The Chancellor House (111-0013/ 111-0132-0508) at 300 Caroline Street is located at the west corner of the intersection of Caroline and Princess Elizabeth streets in Fredericksburg Virginia. The resource, which faces northeast onto Caroline Street, is located on a small 0.11-acre lot that is covered primarily by the dwelling as well as a manicured lawn (Figure 3-9). A picket fence encloses the southwest and northwest portions of the lot. A public sidewalk parallels Caroline and Princess Elizabeth Streets, providing pedestrian access to the resource. A circa-1990 prefabricated shed is located in the western corner of the lot.

3.2.1 Historic Context

The turn of the eighteenth century was a period of significant growth for Fredericksburg. The town, as well as Virginia as a whole, was seeing a shift from an exclusively agricultural society to one with well-developed towns and cities (Fredericksburgva.gov n.d.). Much of the development at that time in Fredericksburg was a result of the port, which due to the fall line, was the last navigable port on the Rappahannock River.

In 1802, John Mortimer purchased the property that would become the Chancellor House from John Minor, who had purchased the land from the estate of Captain William Lewis just one year prior (City of Fredericksburg Deed Book [CFDB] D:346, D:452). Mortimer held several other lots in Fredericksburg, and the parcel at 300 Caroline Street remained vacant during his ownership (Wilson 2002: 319). In 1811 he sold the lot, noted as lot #244 on the 1806 plat of Fredericksburg by Bartholomew Fuller, for $250 to John W. Green (Figure 3-10) (CFDB D:438). John W. Green likely built the house shortly after purchasing the land; the dwelling, as well as a frame kitchen and stable, were insured for $5,100 in 1815 (University of Mary Washington Department of Historic Preservation 2013). This construction date is supported by the Federal styling of the dwelling as well as the use of masonry, as it was built about five years after the Fredericksburg Fire of 1807 (Historic Fredericksburg Foundation, Inc. [HFFI] n.d.a).

FIGURE 3-10: 1806 SURVEY OF FREDERICKSBURG BY BARTHOLOMEW FULLER (FULLER 1806). NOTE LOT 244 OUTLINED IN RED. (MAP NOT TO SCALE)

John Green did not live in the house long as he enlisted in the army during the War of 1812 and, shortly after his return, he was appointed as a judge for the Virginia Court of Appeals in Culpeper (HFFI n.d.a). He moved to Culpeper and used the house at 300 Caroline Street as a rental, with his son acting as the building manager (HFFI n.d.a). Around 1827, the slave trading firm of Smith and Finnall rented the house, likely due to its close proximity to the docks. At the beginning of the nineteenth century, the mid-Atlantic agricultural economy changed from labor-intensive crops such as tobacco to less labor-intensive goods such as wheat. This change in agricultural practice resulted in an overabundance of enslaved labor in the mid-Atlantic region. This is in stark contrast to areas further south, where tobacco, rice, indigo, and other labor-heavy crops were king (Laird 2010:6). This resulted in what has been called the "interstate slave trade" in America, where enslaved people from the upper south and mid-Atlantic were bought by traders and sold further south (Gudmestad 1993).

Mary Berkeley Minor Blackford, who lived down the street from the Chancellor House, wrote in her journal titled "Noted Illustrative of the Wrongs of Slavery" about what she witnessed while Smith and Finnall occupied the house (Hennessy 2011):

> There is within a few yards of our house…a tolerably large brick house owned by Judge Green…By deceiving [Judge Green's] son as to their object, the Negro traders, Smith and Finnall, bought the property to turn into a jail to put the slaves they purchased for the Southern Market in.

She went on to describe how bars were put on the windows and a "slave pen" was constructed in the rear and side yard writing:

> They have now nearly completed a brick wall 16 feet high so as to form a small yard behind the house in which these innocent prisoners can come out to take the air… Every time I passed the wall and saw the poor Negroes working on it (not knowing but that they themselves might be the first to be confined there), my heart seemed bursting with indignation at the great wrong to be committed. Yet what was to be done? (Hennessey 2011).

Though Mary Blackford herself owned slaves, she had a very complicated relationship with the institution and did not wish to see this transpire near her home. In 1833, Mary Blackford and her husband, William M. Blackford, as well as neighbors, Carter and Jane L. Stevenson, interceded and purchased the property so as to rid Caroline Street of the slave traders (CFDB J:308; HFFI n.d.a). At this point, research indicates that the house was no longer used for slave trading purposes. They sold the house to William K. Smith in 1835, a "rich, kind-hearted Yankee" in the words of Mary Blackford (Hennessey 2011).

William Smith, who also owned other property in Fredericksburg, purchased the house to be his primary dwelling and started to modify it by first pulling down the bars in the windows and taking down the wall in the yard that formed the "slave pen" (HFFI n.d.a). He insured the property in 1837 for $3,500, though the policy did not include the previous kitchen or stable (University of Mary Washington Department of Historic Preservation 2013). In 1845, William Smith entered a deed of trust with Brodie S. and Charles Herndon in preparation for purchasing an adjacent property as well as covering his debts in excess of $7,000 (CFDB O:232; HFFI n.d.a). Unable to keep up with payments, the house "together with a large amount of other property" sold at public auction in 1854 to George Aler, a prominent bricklayer and slave trader in Fredericksburg (CFDB T:157). Prior to and during part of his ownership of this dwelling, Aler operated a "slave jail" at the duplex at 314-316 Frederick Street, just a few blocks away (known as the George Aler House (111-0132-0522)). Research did not indicate that he utilized the Chancellor House in connection to his slave trading business, and the property appears to have been used as a dwelling (Hennessy 2010). Wealthy at the time he bought the house, Aler quickly accrued debt, which was only compounded following the Civil War, and the property was auctioned in 1870 with an announcement in *The Fredericksburg News* reading "the house and lot at the corner of Caroline and Princess Elizabeth streets, now occupied by the said George Aler as a dwelling house and garden" (CFDB V:292; HFFI n.d.a).

The property changed hands several more times into the twentieth century, during which time the house underwent substantial changes as can be seen in the Sanborn Fire Insurance Maps (Figure 3-11) (HFFI n.d.a). Many of these changes were done by the Chancellor family, for whom the house is named, who owned the property at the turn-of-the-century and into the 1930s. Between 1886 and 1902, the rear ell was expanded and a carriage house and outbuilding were constructed on the property. By 1912, two porches had been added, one on the main block of the house and the other on the rear ell, and the carriage house demolished. In 1920, the southwestern portion of the lot was subdivided and the outbuilding, as well as most of the original rear ell, was demolished to account for that which is visible in the 1941 Sanborn map (CFDB 55:94). In 1947, the Dickinson family purchased the property and they still own it currently. They constructed the two rear additions that extend from the house today (HFFI n.d.a).

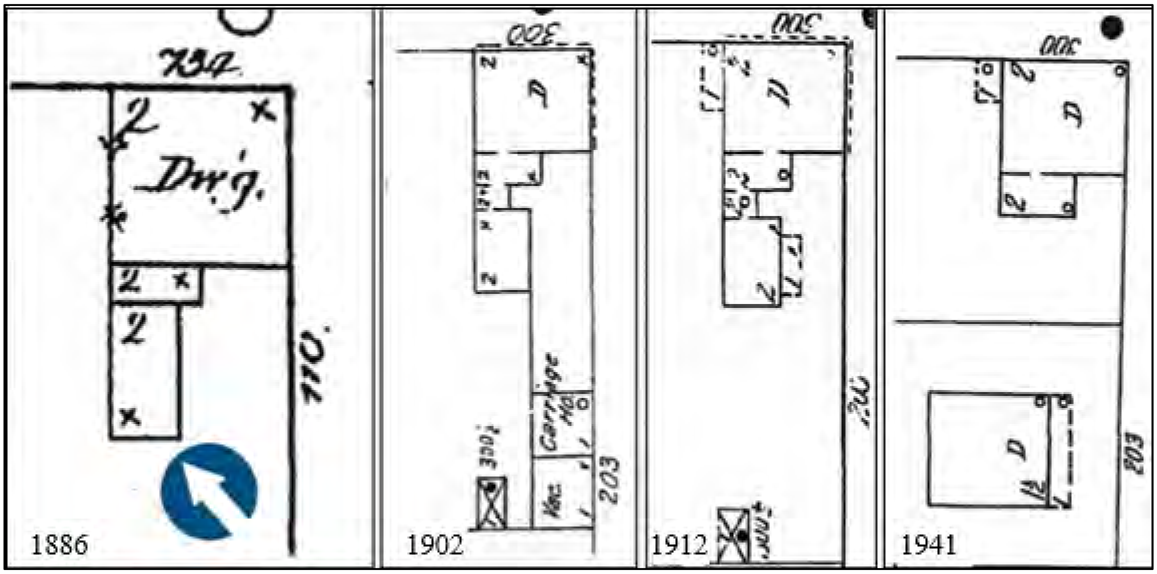

FIGURE 3-11: SANBORN FIRE INSURANCE MAPS OF THE CHANCELLOR HOUSE DATING FROM 1886–1941 SHOWING THE EVOLUTION OF THE DWELLING (HFFI N.D.A)

3.2.2 Architectural Description

3.2.2.1 Primary Resource Exterior

The Chancellor House is a two-story, four-bay, single-family dwelling constructed around 1812 in the Federal style (Figure 3-12). The masonry foundation and structural system are laid in Flemish bond and covered by a side-gabled roof sheathed in standing-seam metal (Figure 3-13). An interior-central brick chimney is located on the southwestern slope of the roof. The primary entrance is located in the easternmost bay of the northeast elevation. It is filled with an eight-paneled wood door with a centered, metal, mail slot. A multi-light, leaded-glass transom tops the door. The door is located within a surround that features fluted pilasters and is sheltered by a small, hipped, pent roof sheathed in standing-seam metal (Figure 3-14). Two stone steps and metal railing lead to the entrance. Other fenestration includes six-over-six, double-hung-sash, wood-framed windows covered by plexi-glass storm windows. The windows are all located on stone sills, topped by jack arches, and flanked by operable, louvered, wood shutters with wrought-metal shutter dogs.

FIGURE 3-12: SITE PLAN OF THE CHANCELLOR HOUSE (GOOGLE 2018) (NOT TO SCALE)

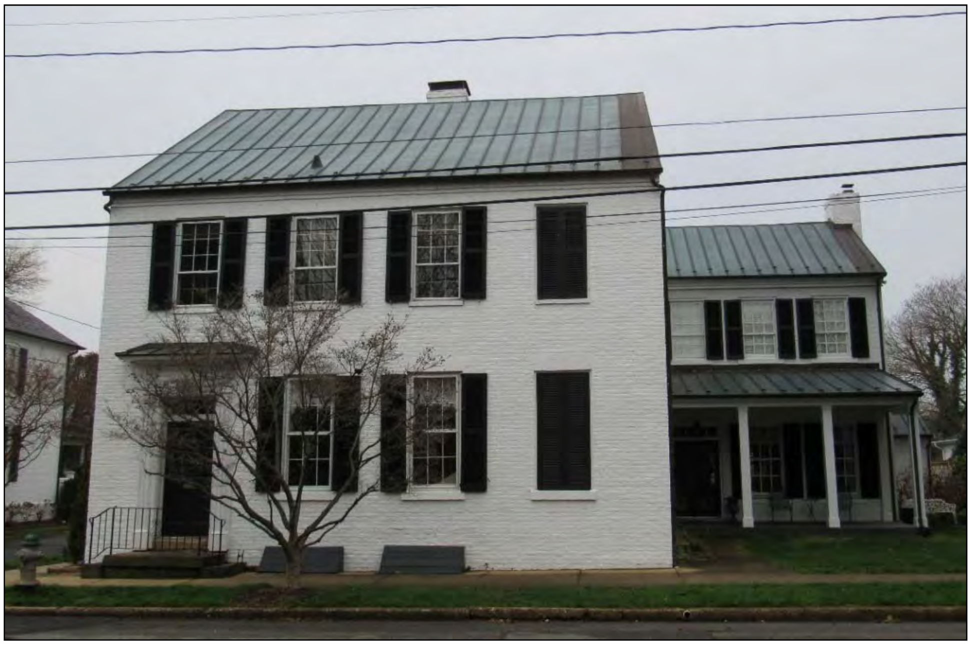

FIGURE 3-13: NORTHEAST ELEVATION

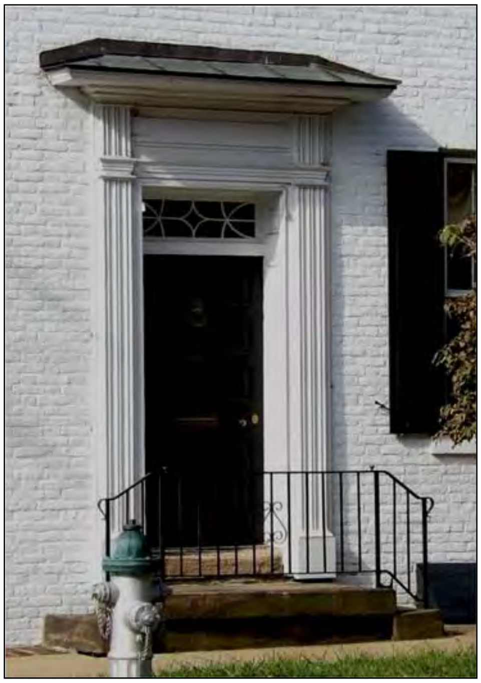

FIGURE 3-14: PRIMARY ENTRY DETAIL

Two large, circa-1990 additions extend from the resource. The first is a two-story, three-bay addition that stretches southwest from the rear of the primary resource (Figure 3-15). The foundation and structural system is clad in a Flemish-bonded brick veneer and covered by a gabled-roof sheathed in standing-seam metal. This addition features one-over-one, double-hung-sash, vinyl windows with false muntins to mimic nine-over-six and six-over-six configuratons. The windows are located on concrete sills and topped by jack arches. A secondary entrance is located in the southernmost bay of the southeast elevation. It is filled with a six-paneled wood door topped by a four-light transom. The door is located under a one-story, one-bay, entry porch supported by square-wood posts and topped by a shed roof sheathed in standing-seam metal. A looped, poured-concrete walkway extends from the public sidewalk to this entrance.

A second circa-1990, two-story, three-bay addition extends northwest from the previous addition (Figure 3-16). It also features a foundation and structural system clad in a Flemish-bond veneer and covered by a gabled roof sheathed in standing-seam metal. An exterior-end brick chimney is located on the northwest elevation. A secondary entrance is located in the easternmost bay of the northeast elevation and is filled with a double-leaf, fully glazed door topped by a four-light transom and covered by a one-story, shed-roof, full-length porch supported by square-wood posts. This addition features windows in keeping with its predecessor and an oriel window on the southwest elevation.

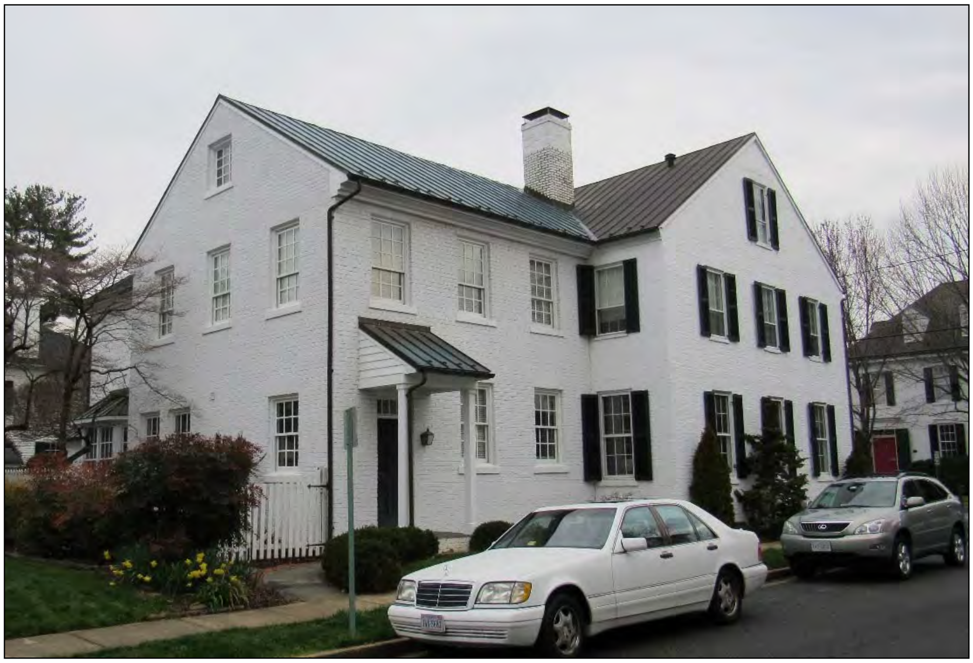

FIGURE 3-15: CIRCA-1990 ADDITION, SOUTH OBLIQUE

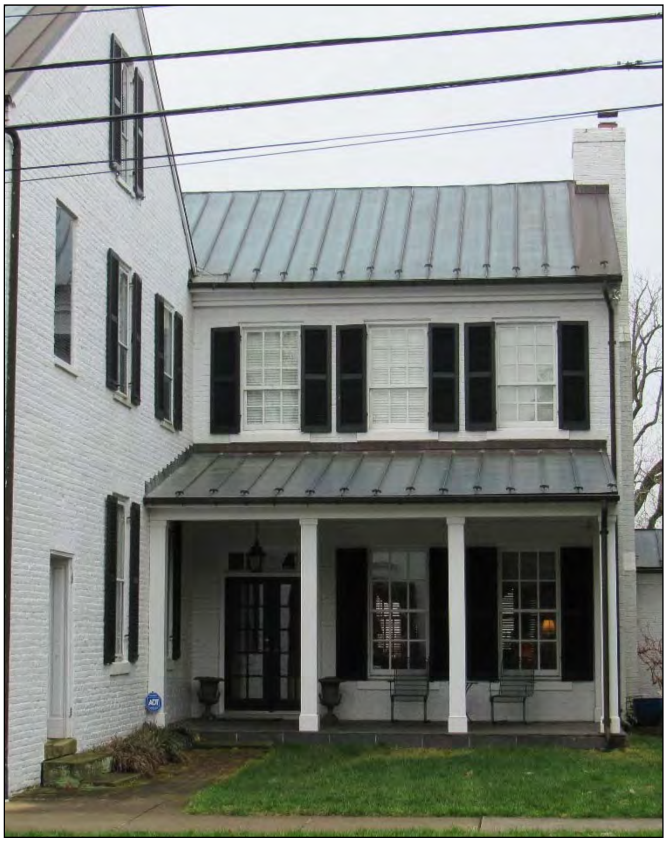

FIGURE 3-16: CIRCA-1990 ADDITION, NORTHEAST ELEVATION

3.2.2.2 Primary Resource Interior

Interior access was not granted during the current survey. Due to massing, fenestration, and age, it is likely the house was constructed in a side-passage plan.

3.2.2.3 Secondary Resources

A circa-2000, one-story, prefabricated shed is located west of the primary resource (Figure 3-17). It is clad in a cement fiberboard siding and covered by a gabled roof sheathed in asphalt shingles.

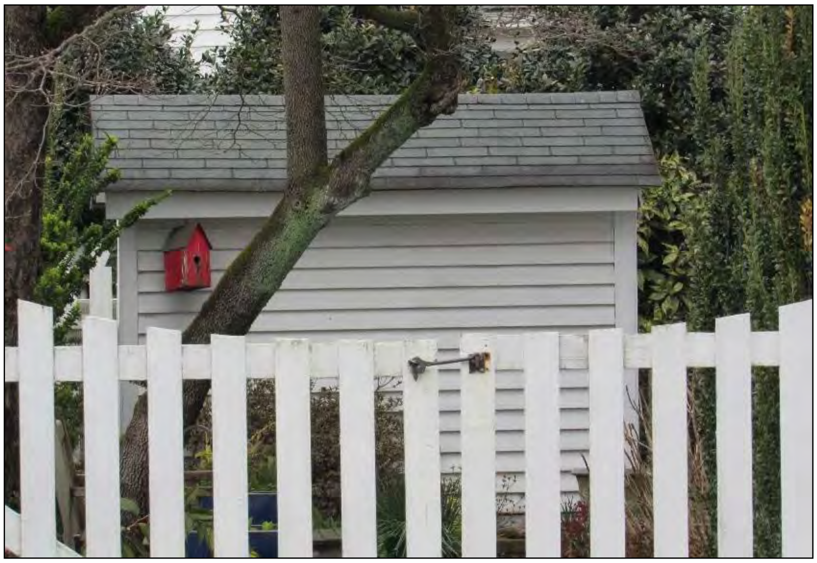

FIGURE 3-17: SHED, SOUTH ELEVATION

3.2.3 NRHP Evaluation

The Chancellor House is a circa-1812, Federal-style dwelling that was later used by local slave traders, Smith and Finnall, from 1827 until 1833 as a holding pen for enslaved people before they would be sold throughout the Southeast. It was later owned by Fredericksburg’s most prolific slave trader, George Aler, though research indicates that he likely continued to operate his slave trading business elsewhere in town, including at the duplex at 314–316 Frederick Street where he operated a slave jail (111-0132-0522). The building has undergone a number of changes over time, including several additions and the loss of all historic outbuildings, however it retains a moderate level of historic integrity of design, location, materials, association, workmanship, setting, and feeling. It is recommended eligible for individual listing in the NRHP under Criterion A for its associations with Fredericksburg’s African-American population and regional slave trade during the mid-1800s. The practice of buying and selling enslaved individuals is prominently known in larger urban centers such as Alexandria to the north and Richmond to the south, but Fredericksburg’s siting on the RF&P and at the mid-point between DC and Richmond rendered a fairly robust market—a market that is mostly unknown and rarely discussed. This property is one of few above-ground reminders of the slave trade in Fredericksburg and connects the city to other trading centers like Shockoe Bottom area in Richmond and beyond, where most all evidence of this practice was demolished in the late-nineteenth and early-twentieth centuries.

The previous owners of the property, including renters Smith and Finnall, are not known to have made lasting and significant contributions to history as important individuals. Therefore, this resource is recommended not eligible for NRHP under Criterion B.

The Chancellor House design and Federal style are not unique within Fredericksburg. Although the house retains many of its original materials such as windows and siding, several large additions have been constructed that have somewhat diminished its original design. It is not the work of a master nor does it possess high artistic values, nor is it an outstanding example of its style or type. For these reasons, the resource is recommended not eligible for the NPHP under Criterion C. As an architectural resource, it was not evaluated under Criterion D.

This resource is situated within the boundaries of the Fredericksburg Historic District (111-0132). Its date of construction (circa 1812) falls within the District's period of significance (1721–1921). As such, the property continues to be a contributing element to the Fredericksburg Historic District.

In sum, the Chancellor House is recommended **eligible for listing in the NRHP under Criterion A at the local level for its association with the slave trade in Fredericksburg and as a contributing element to the Fredericksburg Historic District**.

The proposed period of significance for this resource starts in 1812, when the dwelling was constructed and ends in 1833 when the lot ceased to function in association with the slave trade. The proposed NRHP boundaries for the Chancellor House, as determined during the current investigations, conform to the existing tax parcel (Parcel ID 7789-22-6921), including landscape features.

3.3 JONES-MONROE-RENNOLDS HOUSE (111-0038/ 111-0132-0509)

The Jones-Monroe-Rennolds House (historically known as the Hackley-Monroe House, the Jones House, the Rennolds House, and the Monroe House) is located on 0.5-acre lot on the northeast side of Caroline Street, south of the railroad tracks in downtown Fredericksburg, Virginia (Figure 3-19). Situated on a corner lot, the parcel is bounded by Sophia Street to the northeast, Princess Elizabeth Street to the southeast, and Caroline Street to the southwest, surrounded by similar sized residential buildings. The dwelling is on the western portion of the property with a driveway extending from Princess Elizabeth Street. The lot has a manicured lawn with abounding ornamental vegetation.

3.3.1 Historic Context

Fredericksburg was established in 1728 as a port in Spotsylvania County set on land originally patented in 1671 (V-CRIS 2018). In 1732, the Spotsylvania County Court moved to Fredericksburg and the city was the county seat. When Fredericksburg incorporated in 1781, it ceased to be the county seat. It received charter as the independent city of Fredericksburg in 1897.

Joseph Jones bought the land on which 301 Caroline Street was built in 1772 and constructed the house at 301 Caroline Street sometime between 1784 and 1786 (Labar 1980). Jones (1727–1805) was born in King George County, Virginia and served on several colonial governing bodies. He was a member of the House of Burgesses, represented Virginia at the constitutional convention of 1776, and served in the Virginian House of Delegates in 1776–1887, 1780–1781, and 1783–1785. He held several other representative positions until he was appointed judge of the Virginia General Court from 1778 to 1779, and again in 1789. He was also a member of the state convention which ratified the Federal Constitution in 1789 (United States Congress [USC] n.d.). Jones helped his young nephew, James Monroe (later the fifth president of the United States), move to Fredericksburg to establish his law practice at 908 Charles Street. Correspondence between Monroe and Jones reveals a cordial familial kinship as well as a fruitful business relationship (The James Monroe Museum [JMM] n.d.a).

\\DTS2\Main Job\14-015 RAPS\GIS\2018Work\14_015_AH_Phil.mxd | Last Updated: 04.24.2018

James Monroe and his wife lived at the house at 301 Caroline from 1786 to 1789 (Burnham et al. 2005:91). An insurance record on the property from 1796 describes the house as it would have appeared during Monroe's occupation: a brick house two stories tall covered by a wood roof. A drawing on the insurance document shows two porches, one on the front of the house and one the back (Labar 1980). In a letter to Thomas Jefferson from May 11, 1786, James Monroe describes the house as having been "prepared for him by Mr. Jones" (Labar 1980). In a letter to Thomas Jefferson dated July 27, 1787, Monroe wrote of his transient time in Fredericksburg and of his host:

> I consider my residence here as temporary, merely to serve the purpose of the time, and as looking forward to an establishment somewhere on this side the mountains, and as convenient as possible to Monticello. Mr. Jones is in ill health & begins to be satisfied his existence depends in a great degree upon a similar position (JMM n.d.a).

After the Monroes moved away, Jones resided in the house from 1790 to 1795 (HFFI 2001). The house was next occupied by prominent local attorney Thomas Reade Rootes, who rented the property from 1796 to 1799. The office on the grounds was used by Rootes as the base of his law practice during his tenancy. Rootes bought the property from Jones in 1800 and then purchased "Federal Hill" at 504 Hanover Street the next year, possibly turning 301 Caroline into a rental property once again (HFFI 2001). Thomas R. Rootes Jr. conveyed 301 Caroline in 1806, holding it for 10 years before selling to John T. Ford in 1816 for $3,500 (HFFI 2001).

From 1816 to 1833, the house passed through several families before it was bought by John Stanard in July 1833. John Stanard owned the house at 301 Caroline Street during the Civil War, when it sustained damage from Union bombardment of Fredericksburg (HFFI 2001). An 1862 bird's eye view illustration of the city prior to the war damage shows the medium density of dwellings on lower Caroline Street (Figure 3-20). Though the fenestration is not accurate in the illustration, it gives a sense of the neighborhood in 1862 prior to the bombardment of Fredericksburg during the war.

Robert B. Rennolds purchased the property in 1867 and it remained in the family for 74 years (Davis and Robertson 2012). Elizabeth "Lizzie" Rennolds, daughter of Robert, was a noted socialite, her actions written about in the society sections of Richmond newspapers (i.e., Richmond Times Dispatch 1913). In 1880, the family is recorded as having four African-American domestic servants living in the house in addition to the family (U.S. Census 1880). The Rennoldses made alterations to the property, adding a small front porch and expanding the rear addition between 1886 and 1902 (Figure 3-21) (Sanborn Map Company 1886a, 1902). At some point after 1937, the front entry porch was removed (Figure 3-22).

In 1941, William T. Elmer bought the house from R. G. Rennolds and sold it to L. Dexter Hubbard and Ellen Hubbard in 1957. It passed from Ellen Hubbard to her son, L. Dexter Hubbard, Jr., in 1980 and as of 1999, has been owned by Cheryl and Richard Hazel since 1999.

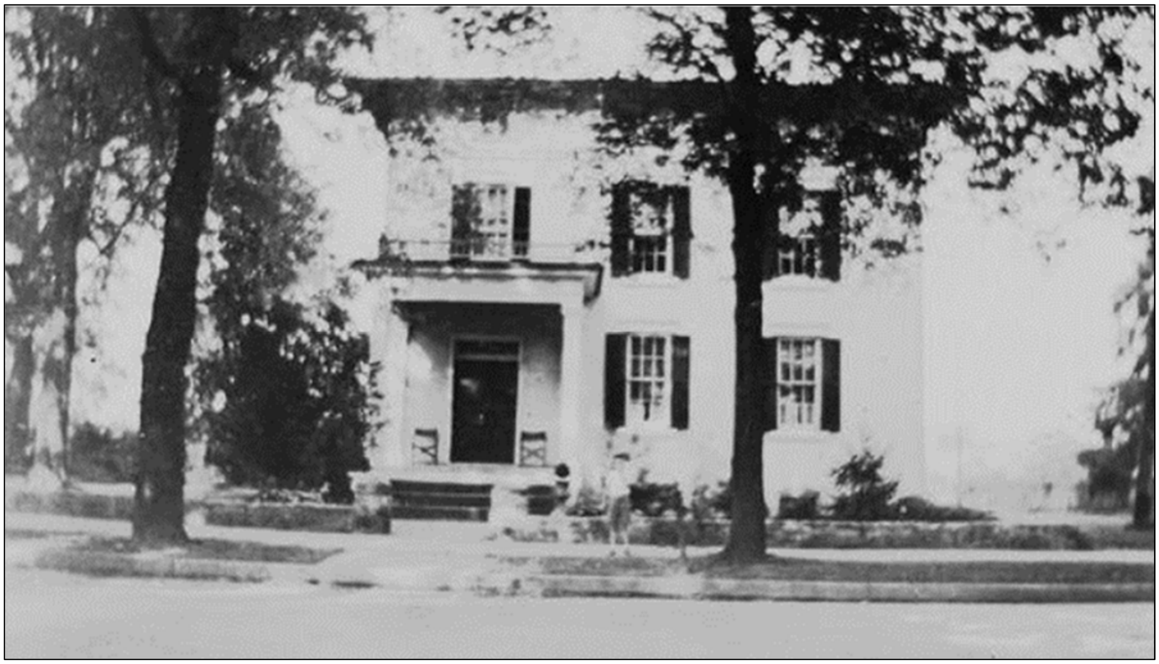

FIGURE 3-22: JONES-MONROE-RENNOLDS HOUSE LOOKING NORTHEAST (DEADERICK 1937)

3.3.2 Architectural Description

3.3.2.1 Primary Resource Exterior

The Jones-Monroe-Rennolds House was constructed circa 1786. This Georgian-style, two-and-a-half story, three-bay, stuccoed-brick, single-family dwelling rests on a continuous masonry foundation (Figure 3-23). The hipped roof is covered with asphalt shingles, lined by a boxed denticulated cornice, and pierced by two interior-end brick chimneys with corbelled caps on the southeast and northwest elevations (Figure 3-24). Two gabled dormers are located on the north and south roof slopes. The primary entrance, located on the southwest elevation, is filled by a double-leaf, wood, paneled door with a brass mail slot. The door is topped by a decorative tracery and a molded wood entablature. A concrete and stone stoop provides access to the primary entry door. The façade features six-over-six, double-hung, wood-framed windows. Other fenestration includes nine-over-nine, double-hung, wood-framed windows. Two gable-end dormers with nine-over-six, double-hung, wood-framed windows with molded surrounds are located on the southwest roof slope.

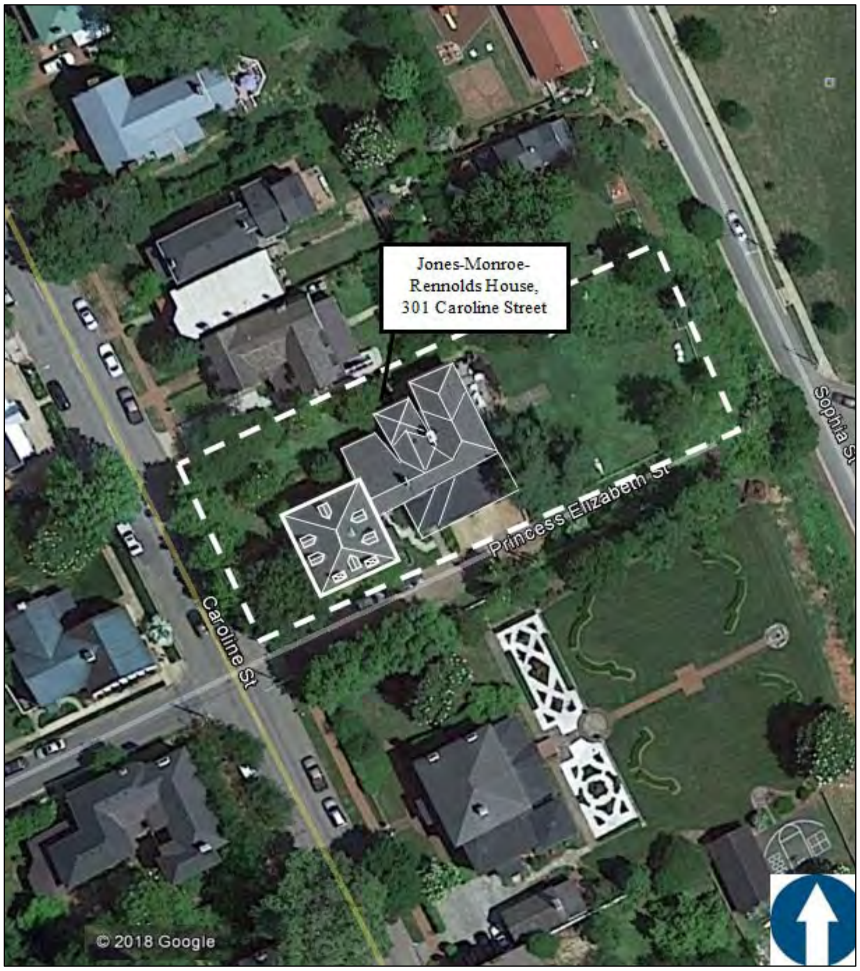

FIGURE 3-23: SITE PLAN OF THE JONES-MONROE-RENNOLDS HOUSE (GOOGLE 2018) (NOT TO SCALE)

A two-story elevator, added in the early to mid-2000s, clad in brick is located on the northeast elevation of the primary dwelling. The elevator door is concealed by a single-leaf, flush metal door. The northwest elevation is comprised of painted brick.

A late-twentieth-century, two-story, brick addition with a complex roof is attached to the east corner of the house and stretches eastward. It is clad in horizontal siding of unknown material and brick veneer. Fenestration includes double-hung-sash, vinyl windows with false muntins, and composite French doors with multi-light transoms. The southeast elevation contains two garage doors, shielded by a shed roof with slightly overhanging eave (Figure 3-25 and Figure 3-26). To the west of the garage doors is a recessed entry bay. A single-leaf, paneled, wood door provides access to the interior of the addition and is reached by a set of brick stairs with an iron rail. It is covered by a shed roof clad in standing-seam metal with a thick entablature and supported by a Tuscan column. This elevation is connected to the primary dwelling by an older, two-story, two-bay addition with nine-over-nine, wood-framed, double-hung-sash windows, and two fixed, multi-light windows at the basement level. This section has a brick interior-end chimney at the north side and was added prior to 1886 according to Sanborn insurance maps (Sanborn Map Company 1886a).

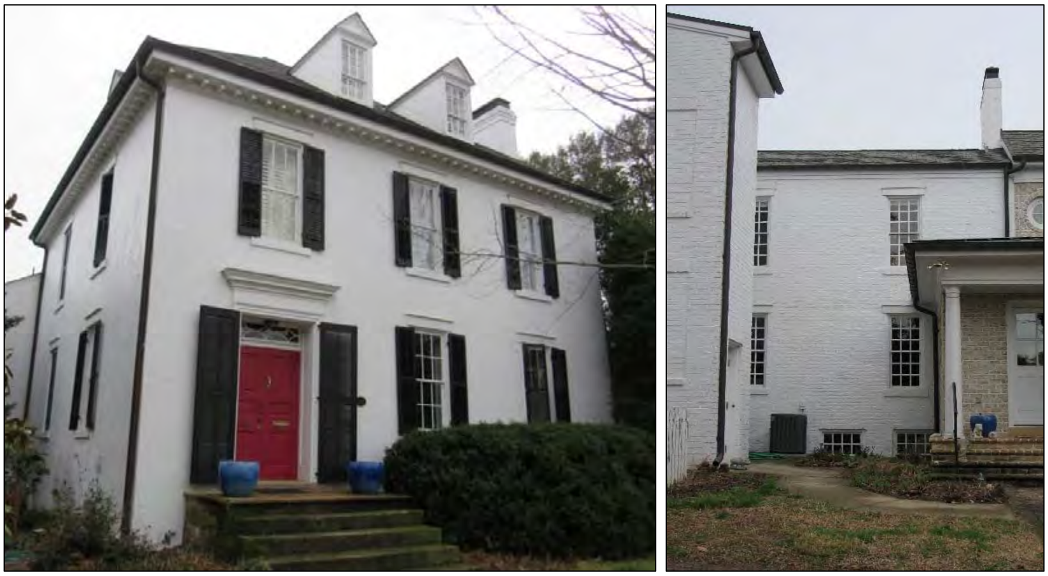

FIGURE 3-24: NORTHWEST OBLIQUE (LEFT) AND SOUTHEAST ELEVATION DETAIL (RIGHT)

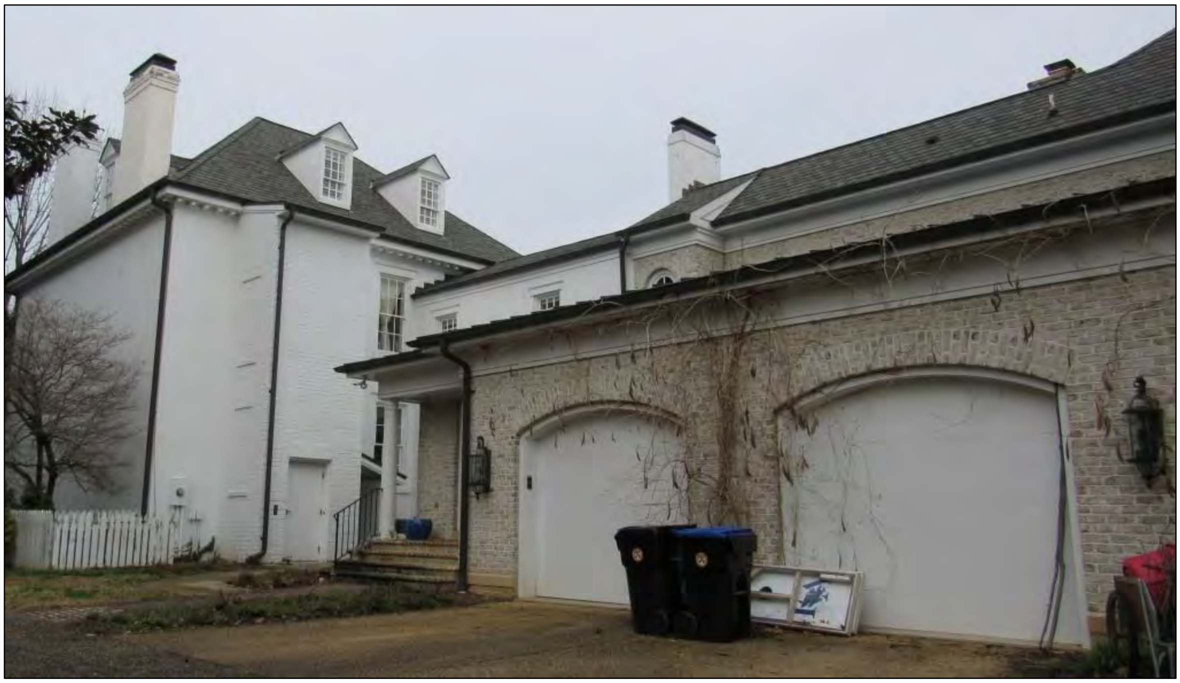

FIGURE 3-25: SOUTH OBLIQUE OF HOUSE AND GARAGE

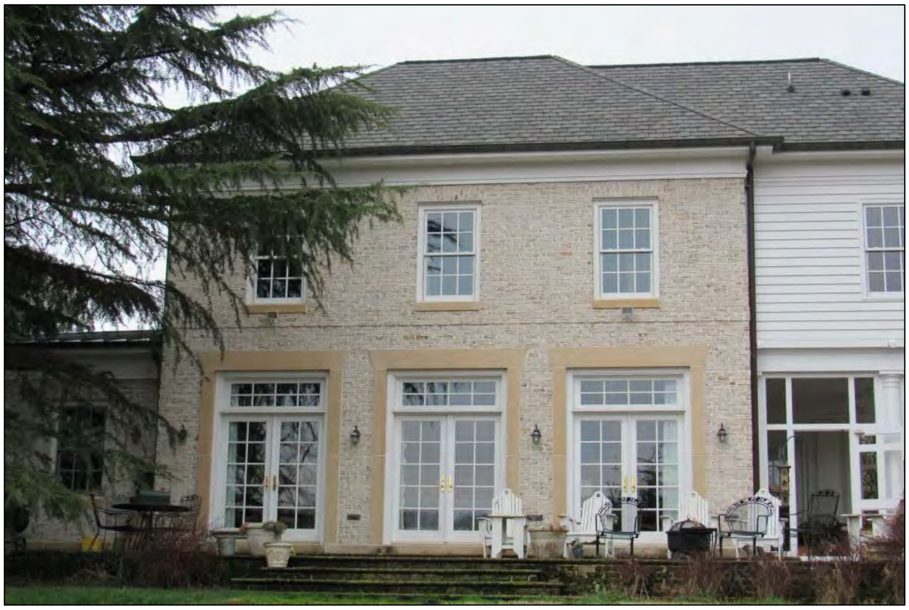

FIGURE 3-26: NORTHEAST ELEVATION OF ADDITION

3.3.2.2 Primary Resource Interior

Interior access was not granted by the current property owner during this effort.

3.3.3 NRHP Evaluation

The Jones-Monroe-Rennolds House is a circa-1786, brick, single-family dwelling. It retains a high level of integrity of location, materials, workmanship, and is in good condition. Additions to the original massing diminish the resource’s integrity of design and setting, but use of compatible materials were placed to be less visible from the street and minimize their visual impact. In order to be eligible under Criterion A, a property must reflect “A pattern of events or a historic trend that made a significant contribution to the development of a community” (Shrimpton et al. 1990). The property at 301 Caroline Street is not known to be associated with any important events and is, therefore, recommended not eligible for the NRHP under Criterion A.

Criterion B addresses historic properties associated with important people in history. Although it was home to several notable figures, especially James Monroe, he did not experience the most influential years of his life while residing in this dwelling, nor is it the only property associated with his life and legacy. Two other houses are associated with James Monroe in Virginia, Highland in Albemarle County (022-0099) and Oak Hill in Loudoun County, the latter of which he had built in 1822 and resided in for 22 years (053-0090). The Monroes occupied the house at 301 Caroline Street for a period of four years, early in James’ law career. A museum and presidential library in Monroe’s honor is located on Charles Street in Fredericksburg on the site of his former law office (111-0132-0232). Opened in 1927, the museum at 908 Charles Street has continuously functioned as a shrine to the former president since opening day, and it is home to the largest collection of James Monroe artifacts in the world, including furniture, letters, ephemera, and library (JMM n.d.b). Judge Jones resided in the home for a short period of time after his time in the Continental Congress and serving the country in an official capacity, but this property is not associated with his years of government prominence. Therefore, this resource is also recommended not eligible under Criterion B.

The Jones-Monroe-Rennolds House has undergone several alterations and additions over the years. The original building retained enough of its historic fabric and character to have been recommended eligible for the NRHP under Criterion C in 2007 (V-CRIS 2018). However, during the current survey, it was found to be representative of a form and style that is common on Caroline Street and within the Fredericksburg Historic District (111-0132), and is not the work of a master. A very large addition, while utilizing sympathetic materials, dominates the massing. Other examples of late-eighteenth century upper-class residential buildings line lower Caroline Street and are better representations of the historical building fabric of this area. Therefore, he DC2RVA team recommends this resource not eligible for listing in the NRHP under Criterion C. As an architectural resource, it was not evaluated under Criterion D.

Although it is not individually significant, the house has been previously identified as a contributing element of the Fredericksburg Historic District (111-0132). As it continues to reflect the history of this area and retains a sufficient level of historic integrity, it is recommended to remain a contributing resource within this district.

In sum, the Jones-Monroe-Rennolds House is **recommended not eligible under Criteria A–C, but is recommended as a contributing resource to the Fredericksburg Historic District.**

3.4 DR. CHARLES MORTIMER HOUSE (111-0067/ 111-0132-0505)

The Dr. Charles Mortimer House at 213 Caroline Street is a single-family dwelling located on lower Caroline Street in Fredericksburg, Virginia (Figure 3-27). It is situated on the southeast corner of Caroline and Princess Elizabeth streets, on an approximately 1.2-acre, irregularly shaped lot and is set back from the street, accented with mature trees and ornamental foliage. Aerial photographs show decorative hedge plantings in a formal rear garden. A brick wall, a portion of which recently collapsed, and a metal fence encloses the property. The primary entrance on the southwest elevation is accessed by a brick walkway. Secondary resources on the property include a kitchen building, garage, basketball court, carriage step, and hitching post. A brick driveway extends from the street at the southwest corner of the lot.

3.4.1 Historic Context

The land on which the house at 213 Caroline Street is located was a section of the original 2,000-acre tract granted to Thomas Royston and John Buckner from Governor William Berkley in 1671. James Williams of Culpeper bought 400 acres of this land on May 13, 1726. Upon his death in 1735, his son, William Williams, inherited a portion of his property not sold to pay for his father's debts (Helsel 1981). This portion, 330 acres, was bought by Roger Dixon in January 1752. Hoping to develop this area, Roger Dixon built a family home in 1758 and divided the surrounding land into lots. When he was unable to sell these lots, Dixon encouraged his brothers Thomas and John Dixon to buy some lots and tried to offload the rest through land lotteries. In 1764, Roger and Lucy Dixon built a home on "lot 253 on Main or Caroline Street whereon a brick house is now building containing .5 acres" (Helsel 1981). Roger Dixon died in 1772, and his brother, John, became his estate executor (Spotsylvania County Deed Book [SCDB] F:453).

\\DTS2\Main Job\14-015 RAPS\GIS\2018Work\14_015_AH_PhII.mxd | Last Updated: 04.24.2018

In 1773, Dr. Charles Mortimer bought this house on Caroline Street from John Dixon (Figure 3-28) (SCDB H:375). Mortimer came to America from Mt. Sligo, Ireland, after studying medicine at the University of Edinburgh, Scotland. He was accomplished in more than medicine; he was a signer of the Westmoreland Declaration which protested British suppression of colonial civil rights and was a member of the Committee of Conference. He was involved in many aspects of life in early Fredericksburg; he founded and operated a hospital (Alum Springs Hospital) during the Revolutionary War and served as Mary Washington's doctor. He was the first Mayor of Fredericksburg, serving from 1782–1783 and again from 1786–1789. Additionally, he was a merchant and owned his own shipping vessels (Helsel 1981).

Upon Mortimer's death in 1801, the house passed to his son, John, and the property changed hands several times until Alexander K. Phillips purchased it in 1867 (CFDB U:36, X:99; City of Fredericksburg Will Book [CFWB] A-3:153; SCDB D:217, F:319). Together with his family, he worked to repair damage to the building caused by the bombardment of Fredericksburg during the Civil War. Phillips' daughter, Nannie, and her husband, General Daniel Davis Wheeler (1841–1916), occupied the dwelling around 1903 and began making improvements to thoroughly modernize it, as noted in a 1904 article from the *Richmond Times-Dispatch* (Richmond Times-Dispatch 1904). Mrs. Wheeler, daughter of the prominent Phillips family who founded the National Bank of Fredericksburg, was a glamourous hostess during their time in Fredericksburg, topping the society news column when she hosted luncheons and dinner parties (i.e., Richmond Times-Dispatch 1905, 1906). General Wheeler served in the Union Army and was awarded a medal of honor for his service in the Battle of Salem Church (1863) (Helsel 1981). During the Wheeler's ownership, they added a Greek-Revival style, one-story, one-bay, entry porch between 1907 and 1919 (Sanborn Map Company 1907, 1919).

After multiple transactions, the house was sold to Alice Heflin in 1924 (CFDB 57:184). According to the 1930 federal census, 86-year-old Alice Heflin lived at 213 Caroline Street, then called Main Street, with her 52-year-old son, Edgar G. Heflin, and 49-year-old daughter, Bessie (U.S. Census 1930). The property stayed in the Heflin family until Frances Biscoe bought it in 1964 (CFWB P:127; Helsel 1981). In 2001, the current owners, Dr. Michael McDermott and Cindy Taylor, purchased the property and undertook extensive renovation working in conjunction with the Director of the Center for Historic Preservation at Mary Washington University, Gary Stanton, to preserve the circa-1764 dining room paneling and other significant interior features, making architecturally compatible additions, and establishing an ornate formal garden in the back yard (Figure 3-29 and Figure 3-30) (Fredericksburg Free Lance-Star 2007).

3.4.2 Architectural Description

3.4.2.1 Primary Resource Interior

This Georgian-style, two-story, five-bay, single-family dwelling is constructed of brick primarily laid in a Flemish bond with a stretcher-bonded foundation (Figure 3-31). A water table separates the English basement from the first story, while a belt course separates the first and second stories. The building is topped by a hipped roof covered with architectural asphalt shingles and pierced by three, brick, interior-end chimneys with corbelled caps (Figure 3-32). A cornice with dentils decorates the eaves. The primary entrance consists of a single-leaf, paneled, wood door, accented with diamond sidelights and tracery. Fenestration on the primary elevation includes nine-over-nine, wood-framed, double-hung-sash windows flanked by louvered wood shutters. At the first floor, each window is topped by a Classical cornice at the first floor, including console, frieze, and dentils. There are no windows on the northwest and southeast elevations of the main massing. The primary entry is sheltered by a one-story, one-bay, hipped-roof porch with full entablature supported by wood Ionic columns. This porch protects a marble threshold and a black and white tile entry deck, accessed by a set of sandstone steps. A metal electric lantern is suspended from the entry porch above the primary door.

FIGURE 3-31: SITE PLAN OF DR. CHARLES MORTIMER HOUSE AT 213 CAROLINE STREET (GOOGLE 2018) (NOT TO SCALE)

A two-story, one-bay, frame addition extends from the southern end of the house. Its west wall is clad in brick while the remainder is clad in weatherboard (Figure 3-33). Attached to the south wall of this addition is a one-story, one-bay porch supported by Tuscan columns. On the east end of this addition is another two-story, frame addition topped by a hipped roof with asphalt shingles. These additions were built in stages, with the eastern section added between 2002 and 2006 (Google 2002, 2006). During this same time period, a full-length, one-story, shed-roof porch was added to the northeast elevation (Figure 3-34) (Google 2002, 2006). It is largely covered by a metal-clad shed roof, but features a central gabled pediment, and is supported by a continuous brick foundation.

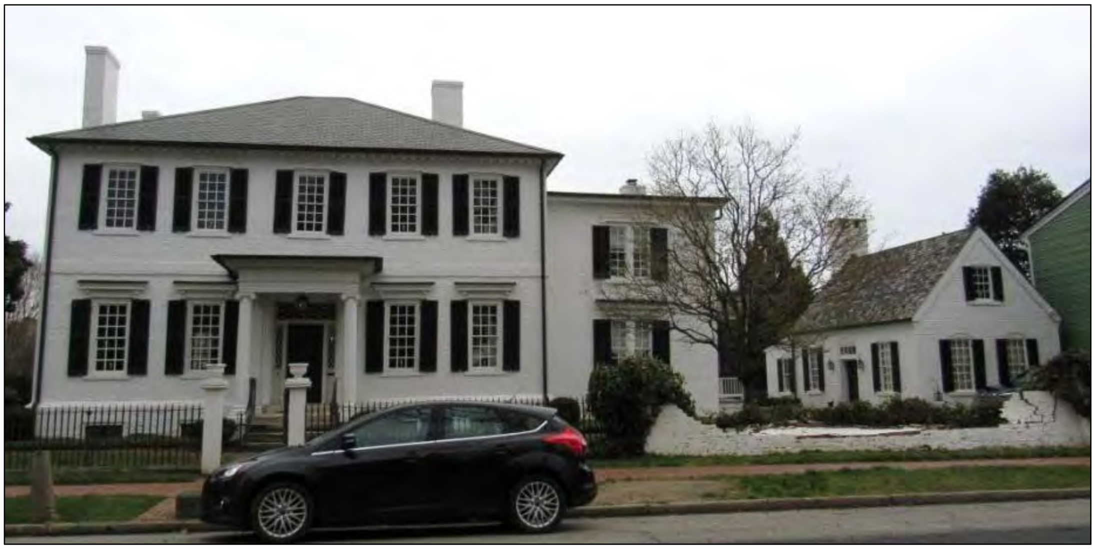

FIGURE 3-32: SOUTHWEST ELEVATION WITH KITCHEN

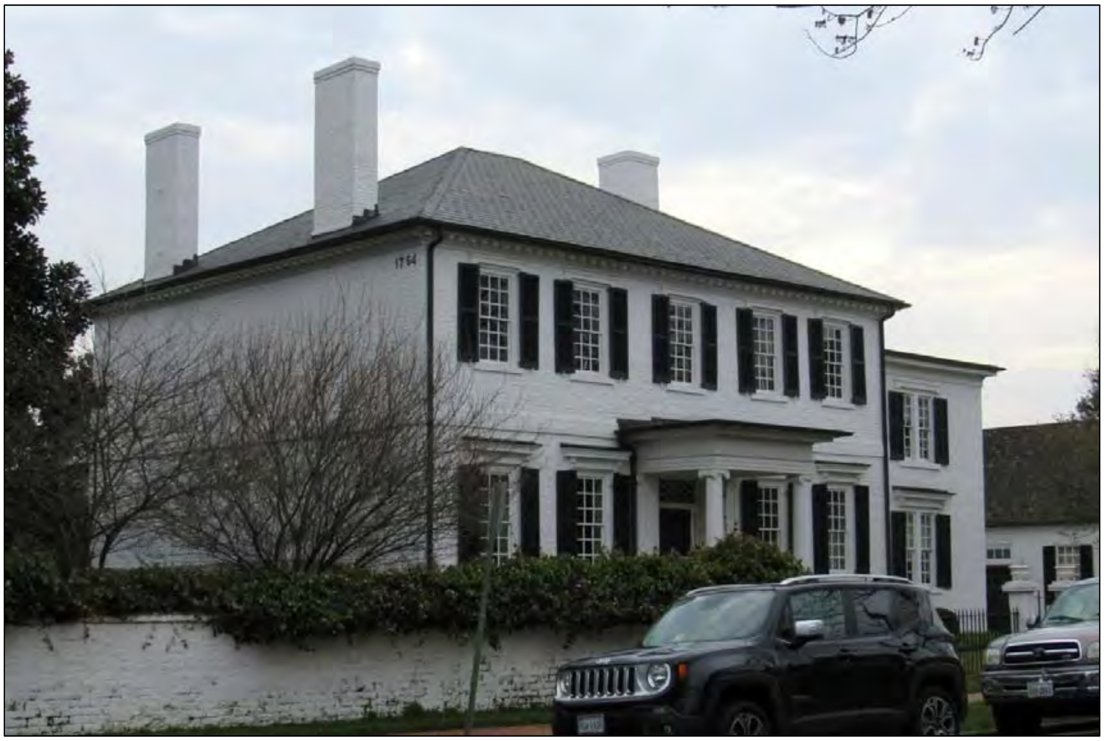

FIGURE 3-33: WEST OBLIQUE WITH BRICK WALL

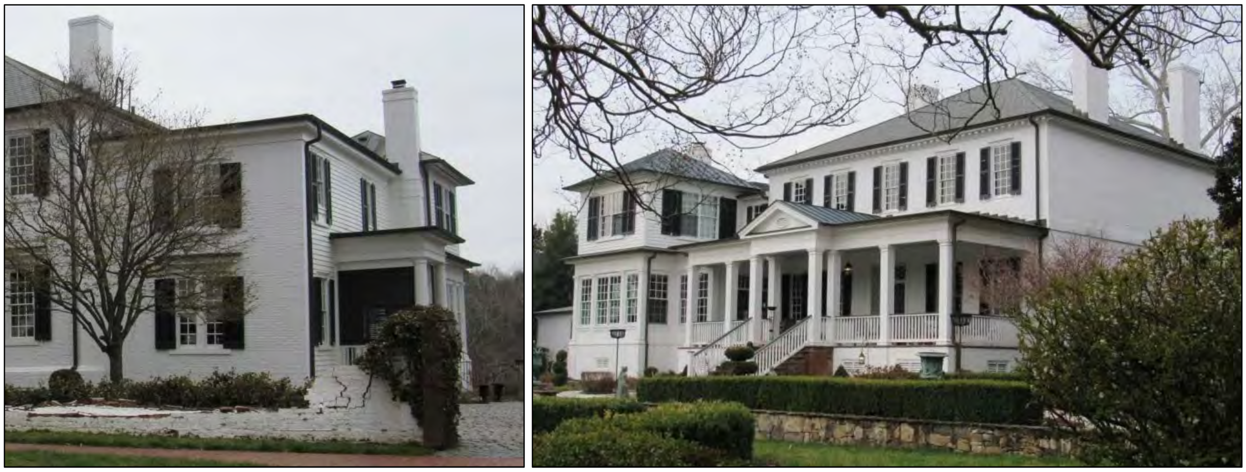

FIGURE 3-34: SOUTH OBLIQUE VIEW OF ADDITIONS (LEFT) AND NORTH OBLIQUE VIEW OF THE MID-2000S TOWER AND PORCH ADDITION (RIGHT)

3.4.3.2 Primary Resource Interior

Interior access was not granted by the current property owner during this effort.

3.4.3.3 Secondary Resources

A one-story, three-bay, brick, former kitchen constructed around the same time as the dwelling is located at the southwest corner of the parcel (Figure 3-35). It is covered by a steeply pitched, side-gabled roof and an interior-end, brick chimney is centered on the east elevation. Windows throughout the building are six-over-six and nine-over-nine, wood-frame, double-hung sashes capped by brick segmental arches. The primary entrance is on the northwest elevation and is filled by a single-leaf, paneled, wood door with a four-light transom. The kitchen renovation was completed through the use of the historic tax credit program (V-CRIS 2018). A one-and-one-half-story, three-bay garage with front-gabled roof is located to the southeast of the primary dwelling (Figure 3-36). It was built before 2002 according to aerial photographs and is clad in a running-bond brick veneer (Google 2002). It has a central garage door flanked by single-leaf, half-glazed pedestrian doors. A diamond light is located in the gable end. A carriage step and hitching post are located on the southwest side of the property between Caroline Street and the primary dwelling (Figure 3-36). They are made of stone and are one of several such features located on lower Caroline Street.

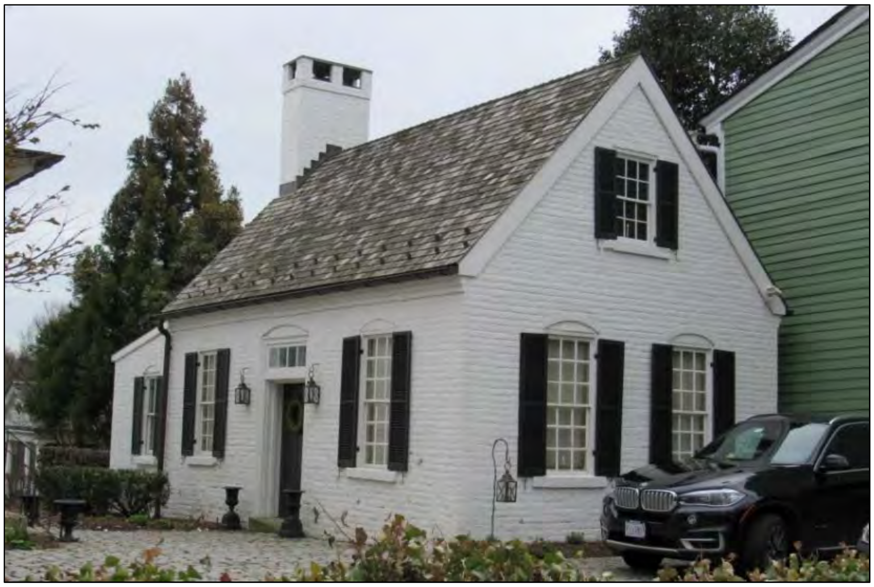

FIGURE 3-35: NORTHWEST OBLIQUE VIEW OF KITCHEN

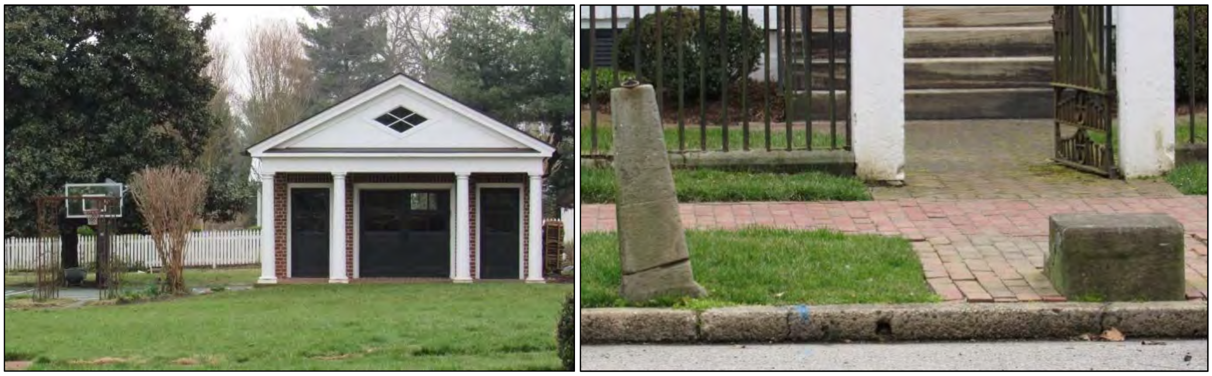

FIGURE 3-36: GARAGE AND BASKETBALL COURT (LEFT) CARRIAGE TIE AND STEP (RIGHT)

3.4.3 NRHP Evaluation

The Dr. Charles Mortimer House was built circa 1764 in the Georgian style as part of a developer-driven boom in housing on lower Caroline Street in the early development of Fredericksburg. It was built as a single-family dwelling and continues in that capacity today. The resource retains a moderate to high level of historic integrity of location, design, setting, materials, workmanship, feeling, and association, despite additions on the northeast and southeast elevations. This resource is not "associated with events that have made a significant contribution to the broad patterns of our history," and, therefore, the DC2RVA team recommends it not recommended eligible for listing in the NRHP under Criterion A (Shrimpton et al. 1990).

Dr. Charles Mortimer played an important role in the early development of Fredericksburg as a successful physician, politician, patriot, and landlord. He lived at 213 Caroline street from 1773 until his death in 1801, a span of 28 years, during which time he served as mayor and treated Mary Ball Washington (1708–1789). He owned several parcels of land in Fredericksburg, including neighboring 214 and 216 Caroline Street built as twin rental houses, but 213 Caroline Street was his primary residence during his occupation in Fredericksburg. This is the location where he fostered his political ideas and ensuing documents and sometimes treated patients—those who were not visited during "house calls." Therefore, this resource is recommended eligible under Criterion B at the local level for its association with Dr. Charles Mortimer, an important figure in Fredericksburg's history.

The Dr. Charles Mortimer House has undergone several renovations and alterations over the years that do not appear to detract from the original character of the dwelling. The house at 213 Caroline Street retains the character-defining features of a high-style Georgian dwelling in Fredericksburg: the wide, squat massing, symmetrical fenestration, centered entry door, English basement, water table, and belt course, interior end chimneys, and Flemish-bonded brick walls (McAlester 2013). The Dr. Charles Mortimer house is one of a handful of high-style Georgian buildings in Fredericksburg. These buildings include Kenmore (111-0047), a two-story, brick dwelling built circa 1775 and the home of George Washington's sister, Betty, which is a National Historic Landmark. Kenmore's scale, massing, fenestration, and Georgian detailing are comparable to the design features of 213 Caroline Street. The Chimneys (111-0015) is a two-story, five-bay, Georgian-styled house on Caroline Street that is listed in the NRHP under Criterion C at the state level. It features similar massing, spatial organization, and fenestration pattern to the Dr. Charles Mortimer House. The street-facing elevation of 213 Caroline Street displays a level of integrity comparable to that of already listed examples of Georgian architecture in Fredericksburg and, moreover, this resource retains its exterior kitchen. The outbuildings at Kenmore are reconstructions and the outbuildings at The Chimneys are later additions. As such, is recommended that this resource is individually eligible under Criterion C at the local level. As an architectural resource, it was not evaluated under Criterion D.

In sum, the Dr. Charles Mortimer House at 213 Caroline Street is **recommended eligible under Criteria B at the local level for its association with Dr. Charles Mortimer, an important figure in Fredericksburg history, and C at the local level for its representation of the Georgian style.**

In addition, the Dr. Charles Mortimer House is located within the boundaries of the Fredericksburg Historic District (111-0132). The resource was built within the district's period of significance and exemplifies architectural trends throughout the community. As such, the Dr. Charles Mortimer House is **recommended as a contributing element to the Fredericksburg Historic District.**

The period of significance for the Dr. Charles Mortimer House begins with its approximately construction date of 1764 and ends when Dr. Charles Mortimer's son obtained the property in 1801. The proposed NRHP boundary for the Dr. Charles Mortimer House at 213 Caroline Street comprises and follows the legal lot description for parcel 7789-22-8895. It is bounded on the north by Princess Elizabeth Street, on the west by Caroline Street, on the south by a series of parcels (Parcel Numbers 7789-22-9725, 7789-22-9721, 7789-22-9687, 7789-32-0792, and, 7789-32-0861), and on the east by Sophia Street (Figure 3-37). The proposed boundaries include the primary dwelling, kitchen outbuilding, garage, basketball court, and carriage step and post.

3.5 SHILOH BAPTIST CHURCH (NEW SITE) (111-0132-0147)

The Shiloh Baptist Church (New Site) at 521 Princess Anne Street is located at the west corner of the intersection of Princess Anne and Wolfe streets in Fredericksburg, Virginia (Figure 3-38). The resource, which faces southwest, is located on a 0.56-acre lot that is covered by a manicured lawn. A poured-concrete sidewalk leads northeast from the public sidewalk along Princess Anne Street to both the main entrance as well as two entrances on the rear-ell addition. Two secondary resources are associated with the Shiloh Baptist Church (New Site), a circa-1920 dwelling and a circa-1945 commercial building, both located northeast of the primary resource with frontage along Wolfe Street.

3.5.1 Historic Context

The first Baptist church in Fredericksburg was established around 1804 and served white congregants as well as enslaved people and freed African Americans (Dollins and Olsen 2015). Although both races were welcome at the services, they maintained separate entrances and seating areas for the first 90 years of the congregation's existence (HFFI n.d.b). By 1815, some members, both white and black, broke off from the original congregation and began a new Baptist church at the northeast corner of Hanover and Sophia streets along the Rappahannock River at the current location of the Shiloh Baptist Church (Old Site) (111-0096), which was once a part of the overall Shiloh Baptist Church in the City of Fredericksburg. Initially, they worshiped in a small wooden building that burned a few years later, and plans to build a new, more substantial church at the same location were made (Dollins and Olsen 2015). In 1820, Horace and Elizabeth Marshall sold the property, known as "Lot 4" on the 1806 Bartholomew Fuller survey of Fredericksburg, to the congregation for $900 to construct a "new Baptist meeting house to be called Shiloh Baptist Meeting House" (CFDB G:2) (Figure 3-39).

Between 1830 and 1840, a brick church was built to support the growing congregation of over 800 members (Figure 3-40). By 1849, many of the white congregants began to plan the construction of a larger church to exclusively be used by whites built at the corner of Princess Anne and Amelia streets (now known as the Fredericksburg Baptist Church (111-0033) (Dollins and Olsen 2015). To finance the new church, it was recommended that the existing building be granted to the black church members once the new sanctuary was complete so long as existing white members, most notably those who enslaved African-Americans, pledged $1,100 or more towards the cost of the new building (Dollins and Olsen 2015).

FIGURE 3-39: 1806 SURVEY OF FREDERICKSBURG BY BARTHOLOMEW FULLER (FULLER 1806) SHOWING THE LOCATION OF THE ORIGINAL SHILOH BAPTIST CHURCH (OLD SITE). NOTE LOT 4 OUTLINED IN RED. (MAP NOT TO SCALE)

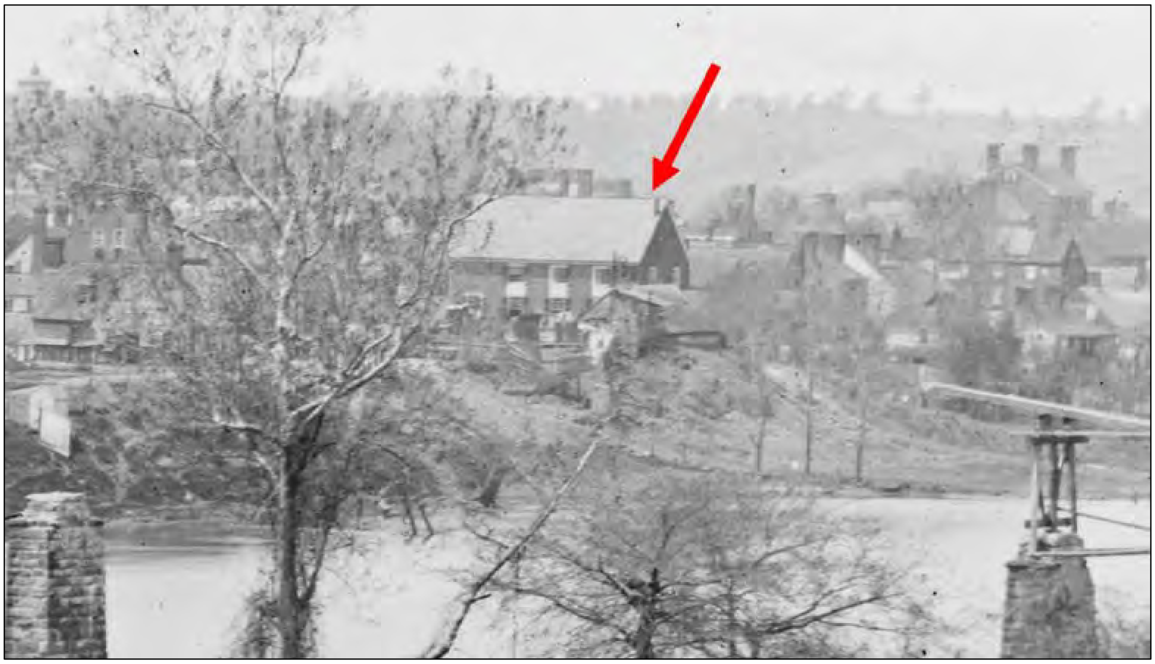

FIGURE 3-40: SECTION OF 1863 PHOTOGRAPH SHOWING THE ORIGINAL FRAME CHURCH BUILDING (O'SULLIVAN 1863)

During the Civil War, like throughout much of Fredericksburg, service at Shiloh Baptist Church was very infrequent and mostly nonexistent (Shiloh Baptist Church (New Site) n.d.). "Much of the membership had fled to Washington. Others had been taken out of the area by their enslavers. Given the large-scale destruction throughout the city and the frequent changes in the military situation, church life become anything but stable" (Dollins and Olsen 2015). The church was also used by the Union Army, with the sanctuary serving as a hospital and the ground floor for a stable. The building suffered damage under their occupation, windows and pews were removed or destroyed, the plaster celling and many support pillars were knocked apart, and the stairs to the gallery were removed, creating structural damage (Dollins and Olsen 2015; Shiloh Baptist Church (New Site) n.d). The rear wall of the Shiloh Baptist Church collapsed in 1886, rendering the building unusable. The church chose to find a new site and purchased the Revere Shop lot, located on the corners of Princess Anne and Wolfe streets, and they immediately began having services in the shop (CFDB BB:361; Shiloh Baptist Church (New Site) n.d.). After settling in at the new location, it was determined that there were legal questions concerning the title of the Revere Shop lot and since the grounds of the old site on Sophia Street were free and clear, some members wanted to return and build on that property. Taking the disagreement to court, the congregation split, legally naming the congregations Shiloh Baptist Church (New Site) and Shiloh Baptist Church (Old Site), with the congregation of New Site being granted the Revere Shop lot in 1889 (CFDB CC:138).

Shiloh Baptist Church (New Site) laid the cornerstone for the new building on June 9, 1890 (HFFI n.d.b). The church was funded by members of the congregation and designed in the Eclectic style, with elements of both the Colonial Revival and Italianate styles (Shiloh Baptist Church (New Site) n.d.b) (Figure 3-41).

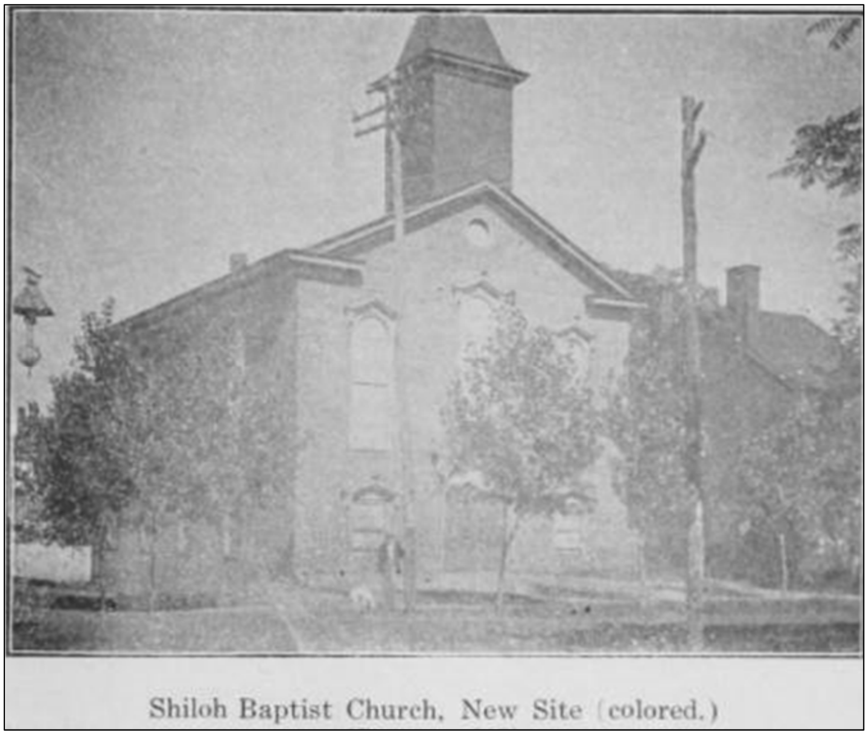

FIGURE 3-41: 1908 PHOTO FROM *THE HISTORY OF THE CITY OF FREDERICKSBURG* (QUINN 1908:272)

The congregation thrived in the new location and soon began to serve the community. Their main focus was on education for the black population in Fredericksburg. In 1905, along with members of the surrounding community, Shiloh Baptist Church (New Site) began the Fredericksburg Normal and Industrial Institute in the church basement (Weaver 2008). This was the first secondary school to serve black students in the area. They began with about 20 students, but quickly outgrew their space, as students from the surrounding counties began traveling to Fredericksburg to attend the school. By 1906, the school board, which consisted of leaders of the Shiloh Baptist Churches (both New Site and Old Site) as well as other prominent black community members were able to purchase a parcel of land outside of the downtown core named "Moorefield" from the Virginia Trust Company. They renamed it "Mayfield," and the school continued to thrive at its new location (Weaver 2008). It was not until 1938 that the school was finally given public funding and was absorbed into the segregated Fredericksburg Public Schools system. Up to that point, the school was funded almost entirely by the African-American Baptist churches in Fredericksburg (Weaver 2008).

In an ever-segregating southern community, the church was also an important hub for the development of an African-American enclave along Princess Anne Street. While the hub of anglo occupation was located along Caroline Street and further north on Princess Anne, the area around Shiloh Baptist Church (New Site)—relatively undeveloped when the church was built—was the perfect location for the proliferation of African-American used and owned businesses. Stemming from the church at Princess Anne and Wolfe streets, dozens of commercial buildings and residences were constructed in this area, all directly related to the black community. This area was such an important enclave of African-American support that it was listed in The Negro Motorist Green Book for decades, highlighting hotels, restaurants, and entertainment venues in this immediate area that were open to black tourists. The entire development began through the church.

Shiloh Baptist Church (New Site) was also very active in the struggle for Civil Rights. As the largest black church in Fredericksburg, they became a site for meetings and visiting speakers. They also worked together with other black churches in Fredericksburg in supporting the sit-ins and demonstrations, as well as the 1963 Civil Rights march through Fredericksburg (Shiloh Baptist Church (New Site) n.d.).

Shiloh Baptist Church (New Site) is one of three historically black churches in the City of Fredericksburg. The other two include Shiloh Baptist Church (Old Site) (111-0096) constructed in 1890, and Mount Zion Baptist Church (111-0132-0678), constructed in 1928. Moreover, of the large African-American enclave that was once centered at Princess Anne and Wolfe streets, only the church remains. Most of the other buildings were demolished in the 1970s to make way for the United States Post Office facility as well as the City Fire Department.

3.5.2 Architectural Description

3.5.2.1 Primary Resource Exterior

The resource is a two-story, three-bay church built with a linear plan in 1890 in the Eclectic style with Italianate and Colonial Revival influences (Figure 3-42 through Figure 3-44). Built on a continuous brick foundation, the masonry church is constructed in a five-to-one, common-bonded brick with a parged water table. A front-gabled roof with partial, wood, eave returns tops the building and is sheathed in standing-seam metal. A steeple pierces the southwest ridge of the roof and is composed of a louvered belfry capped by a pyramidal roof sheathed in copper shingles topped by a slim copper cross. An exterior-end brick chimney with a corbeled cap is located on the southeastern ridge of the roof.

FIGURE 3-42: SITE PLAN FOR SHILOH BAPTIST CHURCH (NEW SITE) (111-0132-0147) (NOT TO SCALE)

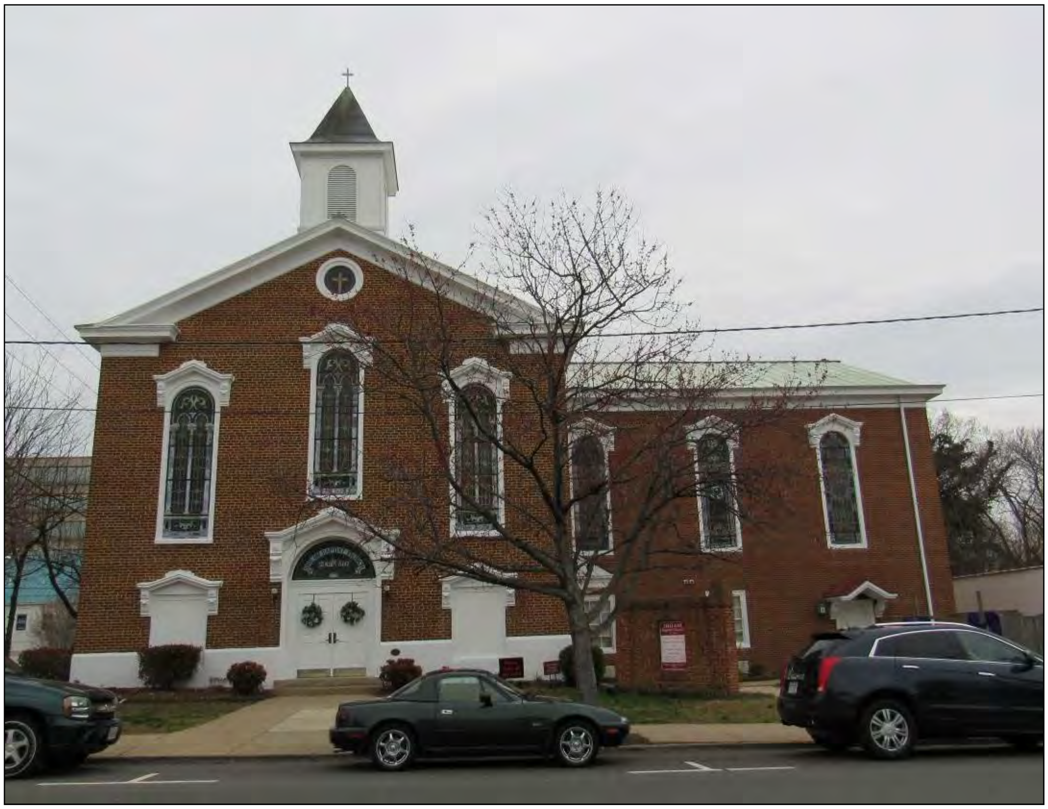

FIGURE 3-43: SHILOH BAPTIST CHURCH (NEW SITE), SOUTHWEST ELEVATION

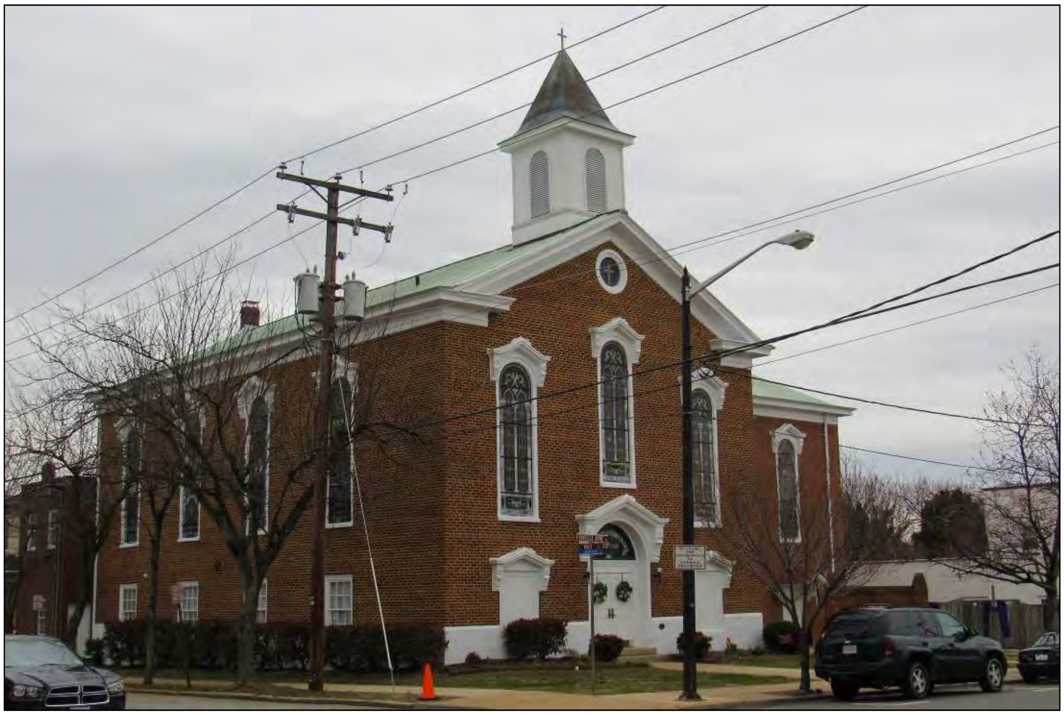

FIGURE 3-44: SHILOH BAPTIST CHURCH (NEW SITE), WEST OBLIQUE

The primary entrance is centered on the southwest elevation and is filled with a double-leaf, paneled, wood door set within a pedimented enframement that features a large, stained-glass fanlight with text that reads "Shiloh Baptist Church New Site" as well as brackets with acanthus leaf motifs and topped by decorative cresting at the pediment peak (Figure 3-45). Two boarded windows topped by pedimented hoods with brackets featuring acanthus leaf motifs and topped by decorative cresting at the pediment peak flank the primary entrance. Two sandstone steps lead to the door. Additional fenestration on the first floor includes, six-over-six, double-hung-sash, wood windows and the second floor features tall, fixed, arched, stained-glass windows topped by pedimented hoods with brackets featuring acanthus leaf motifs and topped by decorative cresting at the pediment peaks. A stained-glass oculus window is located in the gable end of the façade. A secondary entrance is located on the southeast elevation and is filled with a single-leaf, paneled wood door. The door is covered by a two-bay, shed, pent roof covered by standing-seam metal and supported by wood brackets. The pent roof has a peaked-front gable over the door.

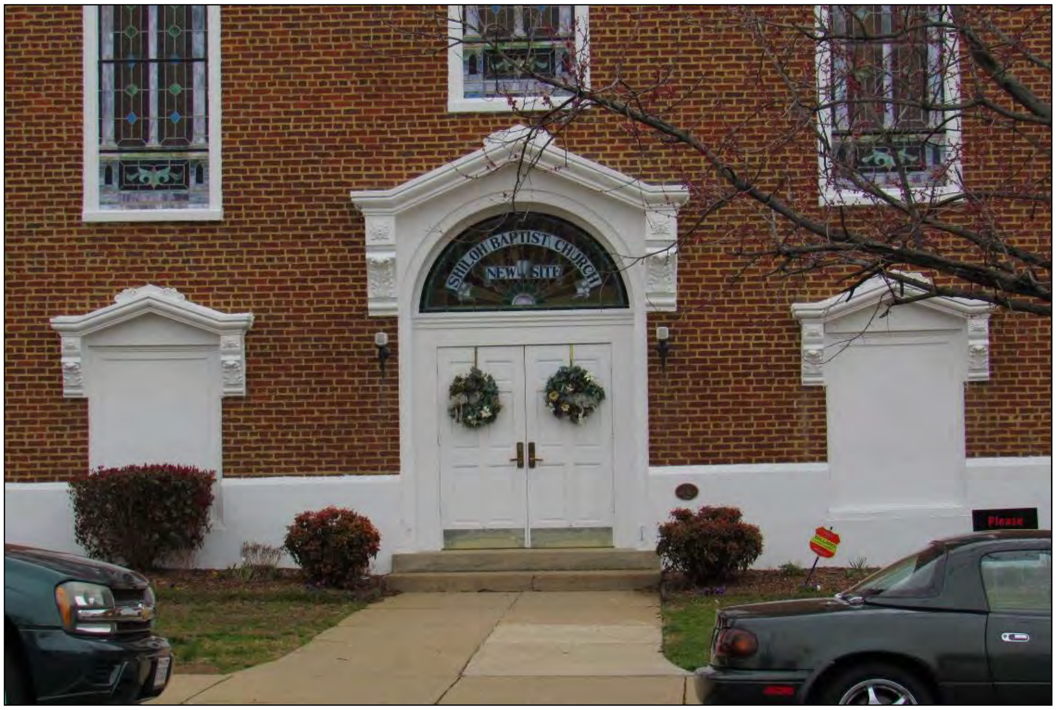

FIGURE 3-45: PRIMARY ENTRY DETAIL

A circa-1980, two-story, three-bay addition extends off the southeast side of the building (Figure 3-46). It is built and clad in the same materials as the main building and features additional stained-glass windows. A secondary entrance is located on the southwest elevation and is filled with a single-leaf, paneled wood door. It is covered by a front-gabled pent roof sheathed in standing-seam metal and supported by wood brackets. A circa-1960 two-story, one-bay addition sits on the northeast elevation (Figure 3-47). The brick addition, laid in a five-to-one common bond, is topped by a flat roof with a parapet wall topped by metal coping and features six-over-six, double-hung-sash, wood windows and a four-light, fixed, wood window. An interior-end brick chimney is located on the northwest elevation. A single-leaf, paneled-wood door is located on the southwest elevation. Two stone steps lead to the door.

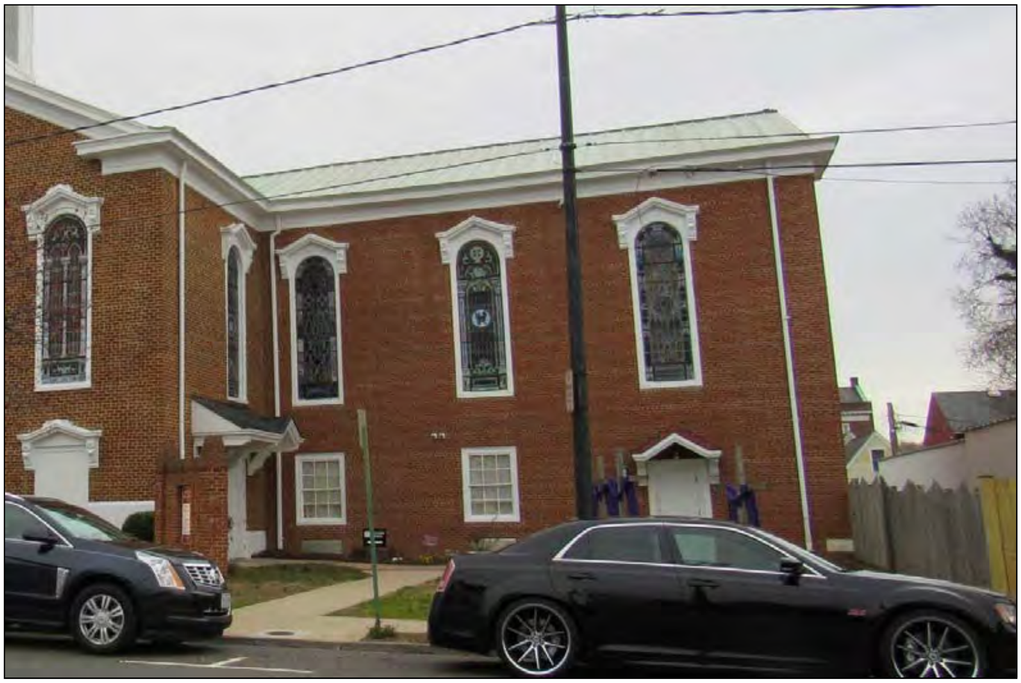

FIGURE 3-46: CIRCA-1980 ADDITION, SOUTHWEST ELEVATION

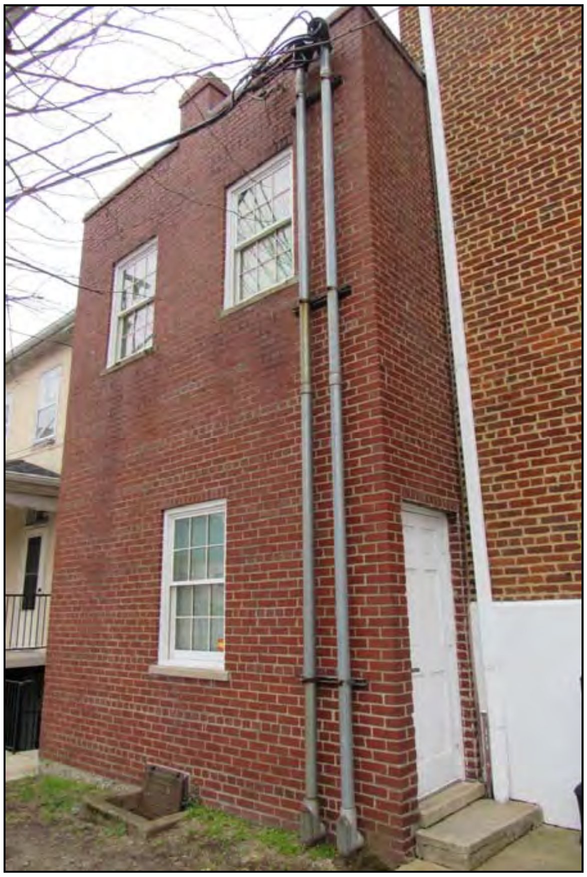

FIGURE 3-47: CIRCA-1960 ADDITION, NORTHWEST ELEVATION

3.5.2.2 Primary Resources Interior

The primary entrance to the church is through the double-leaf door located on the façade. Directly inside the doors of the church is the narthex, which is an L-shaped hallway that extends both northeast and southeast (Figure 3-48). The narthex is carpeted and has plaster walls. A staircase that leads to the attic is located to the southeast of the entry door and a staircase that leads down to the basement is located to the northwest. Both feature carpeted stairs and a wood railing and banister (Figure 3-49). A single-leaf, wood, paneled door leading to a rear addition that was not accessible during this survey is located to the northeast of the entry door. The stained-glass windows that are located on the original core of the building line the narthex.

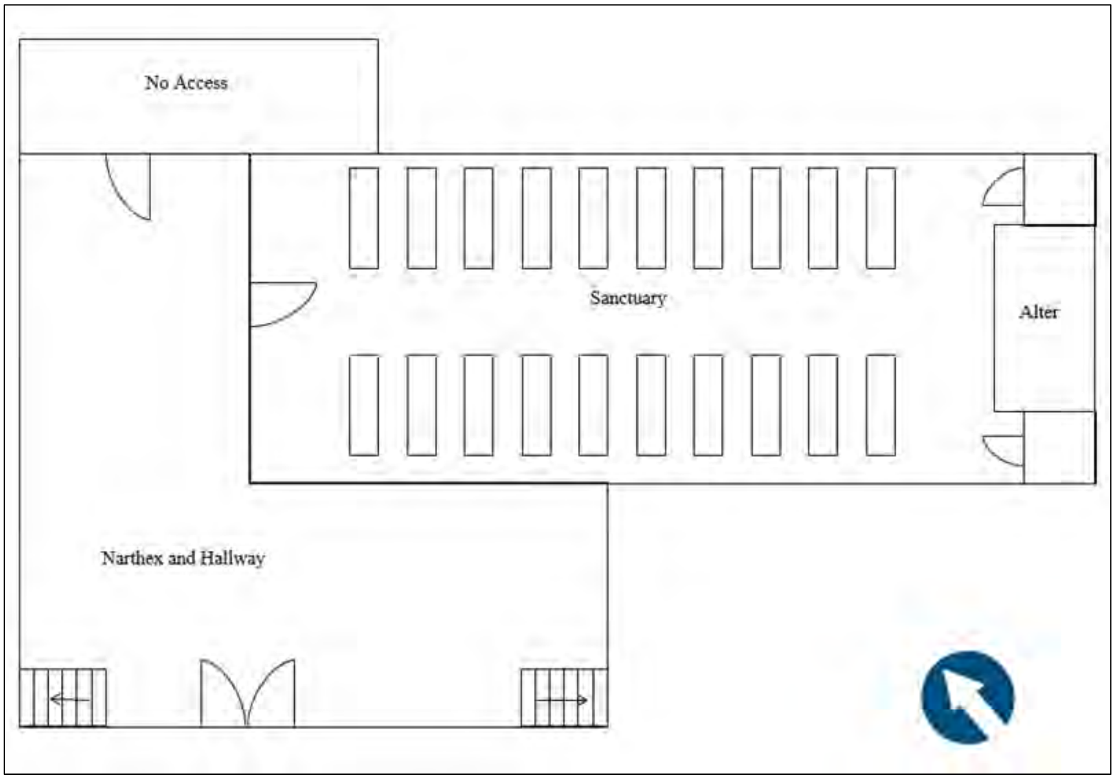

FIGURE 3-48: FIRST FLOOR INTERIOR SITE PLAN

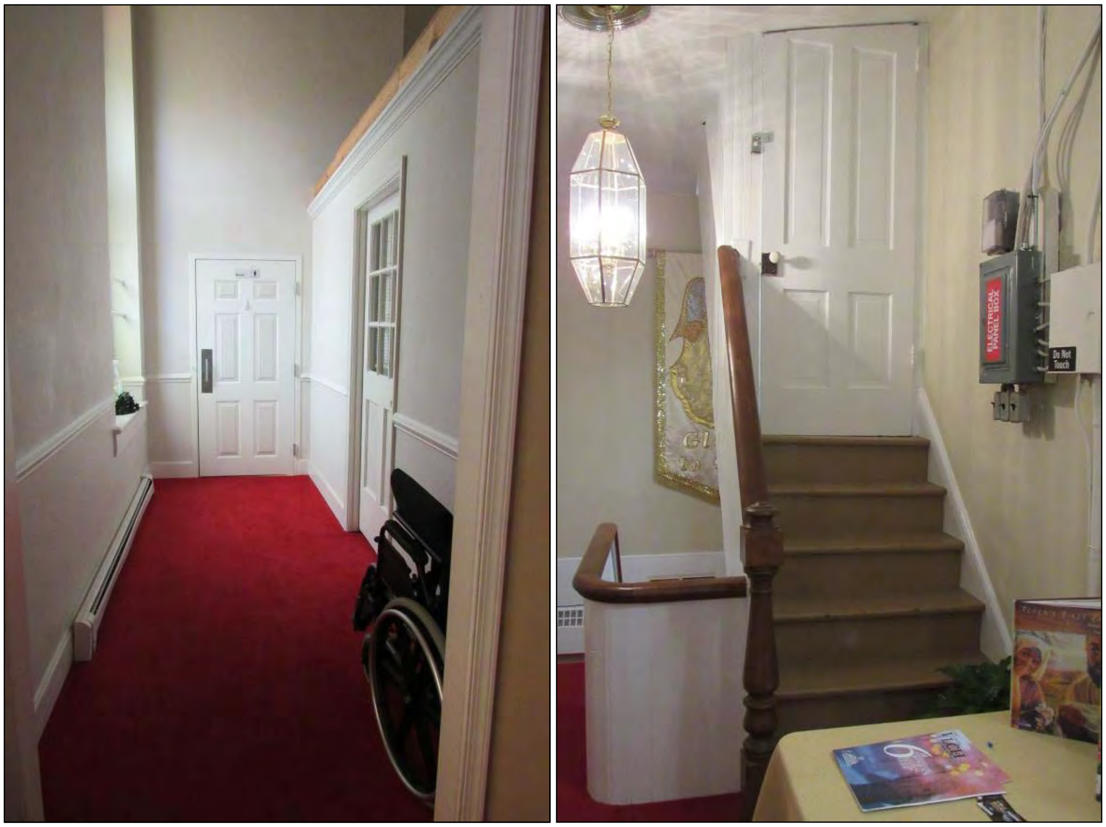
The sanctuary is accessed through a double-leaf, paneled door that is located to the northeast of the narthex entry. The sanctuary runs northwest to southeast though the annex addition. The sanctuary has a linear plan, with a wide central aisle that is lined by wooden pews (Figure 3-50). The walls are plastered, with the northeast and southwest walls containing the stained-glass windows, visible on the exterior of the annex addition. The sanctuary is carpeted and features a drop celling with recessed lighting. The chancel is located at the southeast end of the sanctuary and is raised by one step with a choir area located behind raised by another step. The rear (southeast wall) of the chancel features a large surround with a pecked pediment and entablature. The chancel is flanked by two vestry rooms, both accessed by single-leaf, paneled wood doors located within simple wood surrounds with fluted pilasters.



ELECTRICAL PANEL BOX
Do Not Touch

FIGURE 3-49: VIEW INTO NARTHEX FROM PRIMARY ENTRY, LOOKING NORTHEAST (LEFT) AND VIEW OF DOOR LEADING TO ATTIC (RIGHT)

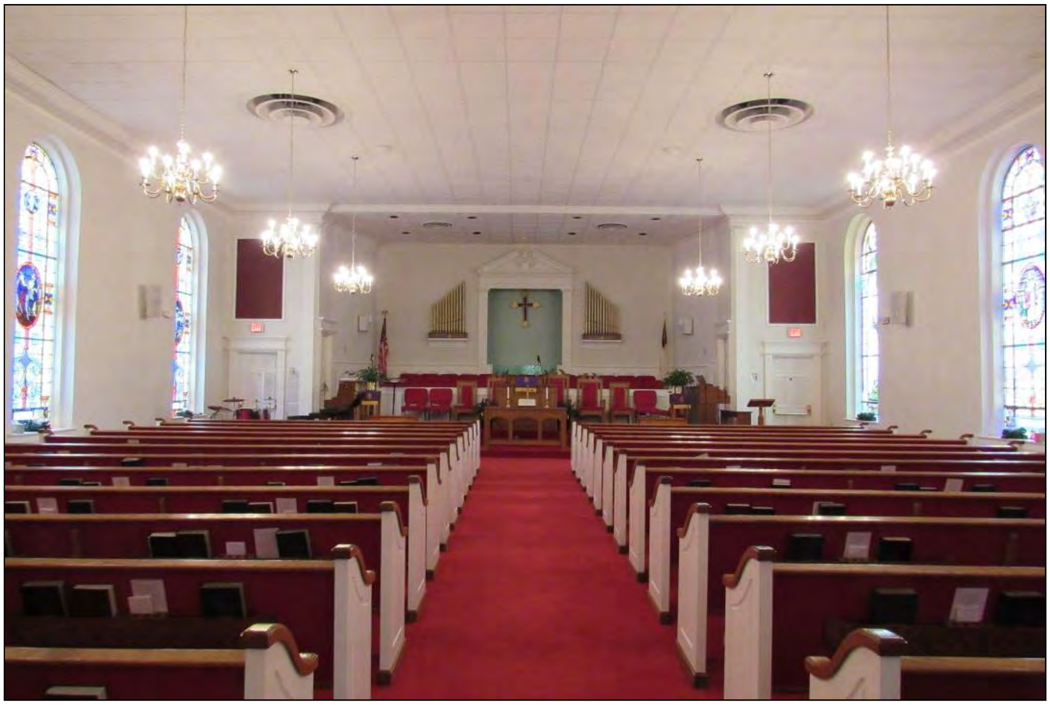


FIGURE 3-50: VIEW INTO SANCTUARY FROM NARTHEX, LOOKING SOUTHEAST

The basement of the church features classrooms, a kitchen, and bathrooms (Figure 3-51). The basement is accessed from the narthex though a set of wooden stairs that are located to the northwest of the primary entrance. The stairs lead down to a carpeted landing with a set of double-leaf, paneled, wood doors located to the southeast that leads to a large classroom as well as a single-leaf wood paneled door that leads to a smaller classroom on the northeast wall (Figure 3-52). Both classrooms feature linoleum floors, drywall with a chair rail, and drop ceilings. A large commercial kitchen is located to the northeast of the larger classroom and also features linoleum floors, drywall, and drop ceilings. A hallway leads southeast of the classrooms and kitchen and features a single-leaf, paneled, wood door that leads to a supply closet flanked by two restrooms. Access was not permitted to the attic during this survey.

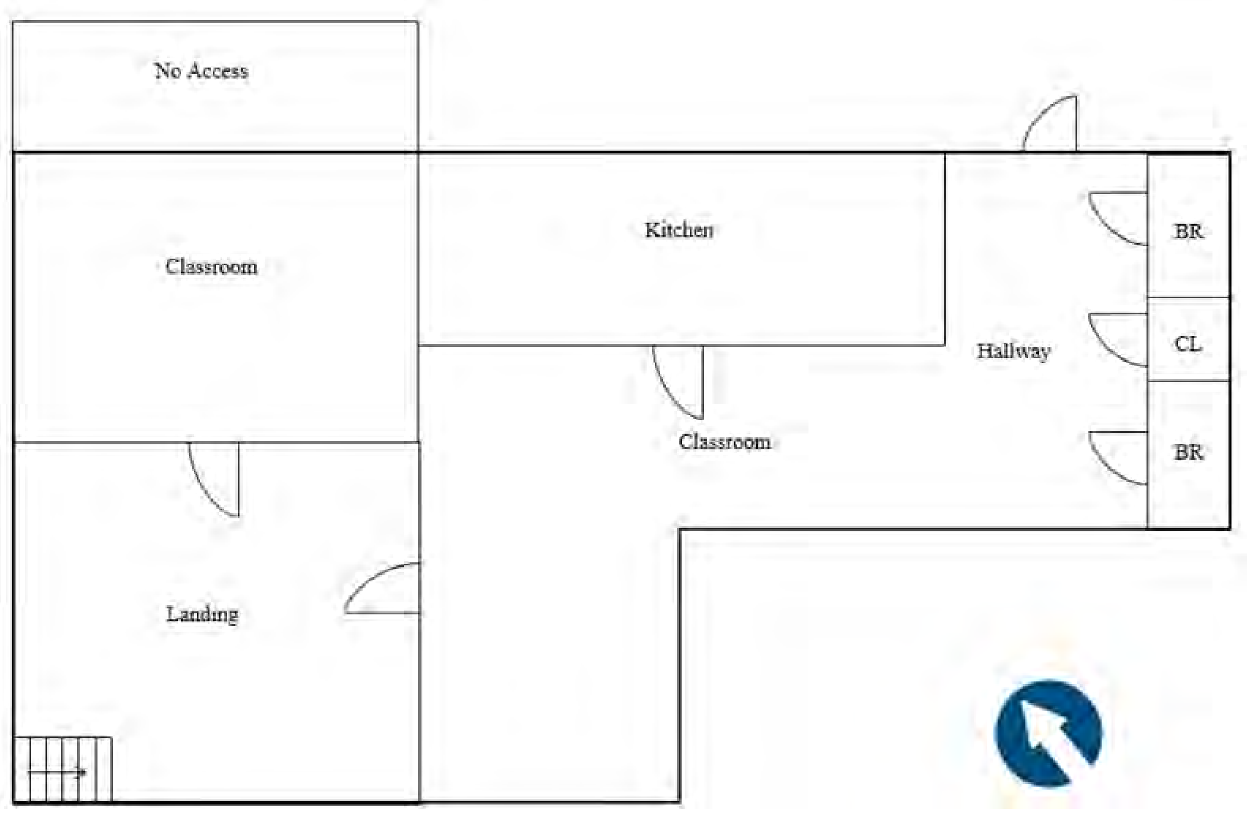

FIGURE 3-51: BASEMENT INTERIOR SITE PLAN

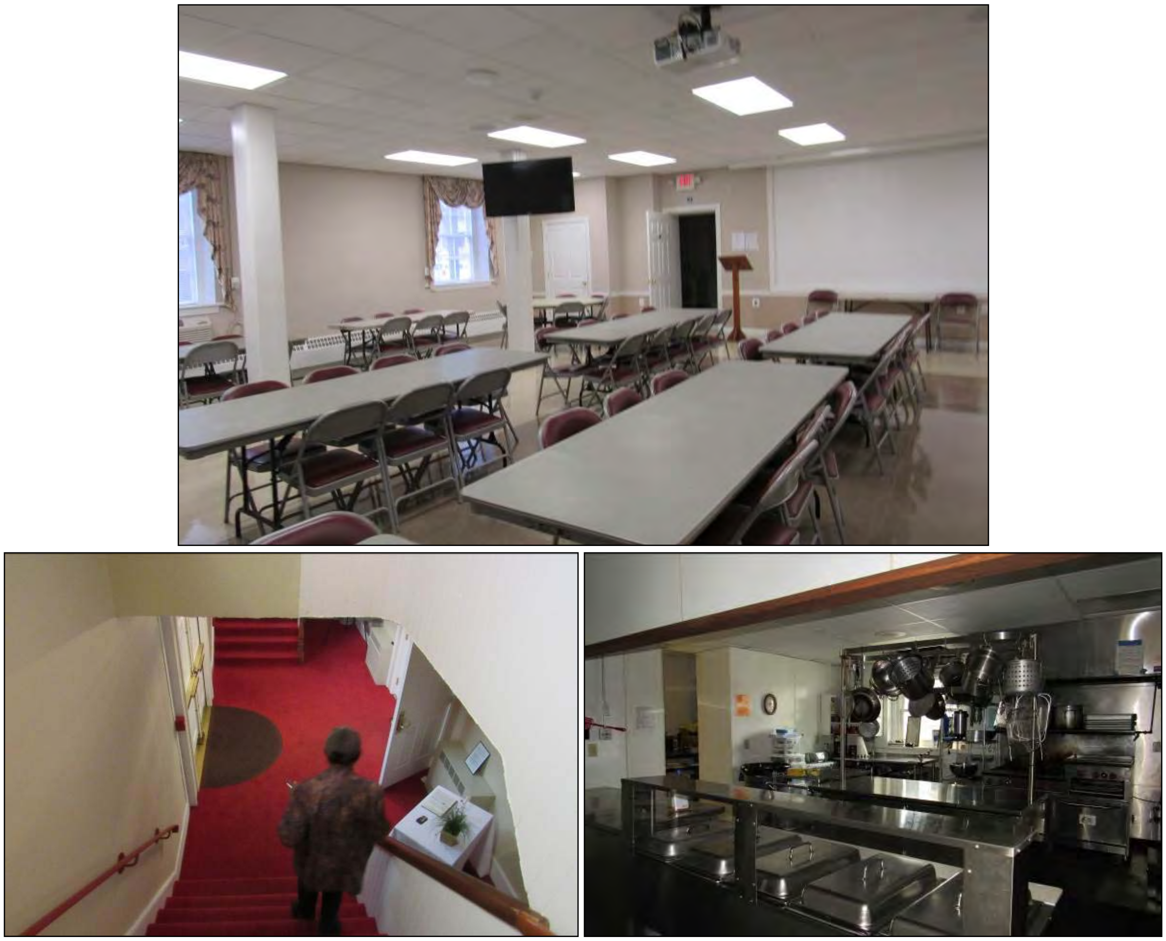

FIGURE 3-52: DETAIL FROM THE BASEMENT. LARGE CLASSROOM, LOOKING SOUTHEAST (TOP); LANDING AT BOTTOM OF STAIRS (BOTTOM LEFT); AND COMMERCIAL KITCHEN (BOTTOM RIGHT)

3.5.2.3 Secondary Resources

A circa-1920, two-story, two-bay dwelling located to the east is associated with the church (Figure 3-53). The raised foundation and structural system are parged and covered by a hipped roof sheathed in asphalt shingles. The primary entry is located in the westernmost bay of the northwest elevation and is filled with a fully-glazed door covered by a storm door and topped by a single-light transom. A one-story, full-width, entry porch covers the primary elevation. It is supported by decorative metal posts and metal railing. The porch is covered by a hipped roof sheathed in asphalt shingles and is accessed by a set of poured concrete steps. Other fenestration includes two-over-two, double-hung-sash, wood-framed windows.

A circa-1940, one-story, three-bay, commercial outbuilding is located to the east of the church and dwelling (Figure 3-54). The foundation and structural system are clad in a running-bond brick veneer with aluminum siding in the gable end and covered by a front-gabled roof sheathed in asphalt shingles. The primary entry is located in the westernmost bay of the northwest elevation and is filled with a single-leaf, six-panel, wood door. Other fenestration includes single-light, fixed windows.

3.5.3 NRHP Evaluation

Shiloh Baptist Church (New Site) was constructed in 1890 and traces its roots back to the first Baptist church in Fredericksburg. The church has been an important part of the ante- and post-bellum, African-American community by being a space for spiritual and personal growth as well as playing a role in early African American education and the Civil Rights movement in Fredericksburg. Shiloh Baptist Church (New Site) retains a high level of historic integrity of location, and a moderate to high level of integrity of setting, materials, workmanship, design, feeling, and association.

Shiloh Baptist Church (New Site) has served as an important social and spiritual space for African Americans in Fredericksburg since it was constructed. Shiloh Baptist Church (Old Site) (111-0096) was listed in the NRHP in 2015 under Criterion A for its importance to the African-American community and Criterion C for its unique architecture. The Shiloh Baptist Church (New Site) is also important for its role in early African American education in Fredericksburg, particularly for its support of the Fredericksburg Normal and Industrial Institute, and also its role in the Civil Rights movement locally. Moreover, the presence of the church was a central hub for what became Fredericksburg's primary African-American enclave during the first half of the twentieth century. Numerous businesses catering to black residents and tourists were built around the church. The area was so well-known for its welcoming support of the black community that it was listed in The Negro Motorist Green Book for many years; the church was unquestionably the nucleus of this development. It is the sole remaining building of what was once a cluster of dozens of black-owned and black-patronized establishments. For these reasons, the DC2RVA team recommends that the resource is eligible for listing in the NRHP under Criterion A.

For a historic resource to be considered eligible under Criterion B, it must be associated with a person who is "individually significant within a historic context" and who has "gained importance within his or her profession or group" (Shrimpton et al. 1990). Though several pastors and members of Shiloh Baptist Church (New Site) have been important to the local community, their involvement in the church does not in and of itself merit NRHP eligibility under Criterion B.

Shiloh Baptist Church (New Site) is an 1890, two-story, three-bay, Eclectic-styled church with Italianate and Colonial Revival influences. The church was constructed by members of the congregation and serves as one of the only three African-American churches in downtown Fredericksburg. Mount Zion Baptist Church (111-0132-0678) was constructed in 1928 in the Gothic Revival style to serve the growing African American community along Wolfe Street and has not been evaluated for NRHP eligibility. Shiloh Baptist Church (Old Site), listed in the NRHP in 2015, was built at about the same time as Shiloh Baptist Church (New Site), but the latter retains a higher level of historic integrity of materials, workmanship, and design at the exterior due to the fact that Shiloh Baptist Church (Old Site) has undergone a wholesale replacement of the primary façade. For these reasons, it is recommended that the resource is eligible for listing in the NRHP under Criterion C**.** As an architectural resource, it was not evaluated under Criterion D.

In addition to meeting one of the main four criteria for NRHP listing, a church must also meet Criteria Consideration A which states that a religious property is "eligible if it derives its primary significance from architectural or artistic distinction or historical importance" (Shrimpton et al. 1990:26). Shiloh Baptist Church (New Site) is architecturally significant as a good example of African-American-associated architecture in Fredericksburg and is in excellent condition. The church has also been important to the African American community. As such, the Shiloh Baptist Church (New Site) meets the conditions to qualify for the NRHP.

This resource is located within the NRHP-listed eligible Fredericksburg Historic District (111-0132). Shiloh Baptist Church (New Site) was built during the district's period of significance (1721–1921) and contributes to the historic integrity and architectural significance of the district as a whole. As such, it remains a contributing resource to it.

In sum, the Shiloh Baptist Church (New Site) is **recommended eligible for listing in the NRHP under Criteria A and C, as well as Criteria Consideration A, and is recommended a contributing element to the Fredericksburg Historic District.**

The proposed period of significance for this resource starts in 1890 when the church was constructed and continues through the Civil Rights era. The National Park Service states that "Fifty years ago is used as the closing date for periods of significance where activities begun historically continued to have importance and no more specific date can be defined to end the historic period" (NPS 1997). For this reason, 1968 was selected as the end date for period of significance for this resource. The proposed NRHP boundaries for Shiloh Baptist Church (New Site), as determined during the current investigations, conform to the existing tax parcel (Parcel ID 7789-23-0715), including landscape features, excepting the educational building to the south of the primary resource (Figure 3-55). That building was formerly a privately-owned funeral home and has previously been recorded as such.

3.6 ROBERT ADAMS RESIDENCE (111-0132-0458)

Built in 1891 by Robert W. Adams, the Italianate style dwelling located at 528 Caroline Street (111-0132-0458) is located at the southwest corner of the intersection of Caroline and Wolfe Streets in the southern end of the NRHP-listed Fredericksburg Historic District (111-0132). This area of the district is heavily populated and comprises mixed commercial and residential properties. The building encompasses a majority of its 0.09-acre, rectangular-shaped lot with its primary elevation facing towards Caroline Street and the Rappahannock River (east) (Figure 3-56). The eastern boundary of the property is lined with a brick public sidewalk while the northern boundary with Wolfe Street is lined with a poured-concrete sidewalk and a plant bed filled with mature bushes and plantings. A brick garden wall is located immediately south of the primary dwelling and leads to a private garden area. To the south is another residential dwelling (111-0132-0457) and to the west is the Shiloh Baptist Church (New Site) (111-0132-0147).

3.6.1 Historic Context

Robert W. Adams (1823-1891), a prominent local businessman and political figure, was born in Fredericksburg and resided there throughout the majority of his life (Kent 1991). He began working at the age of 13 in 1837 as a clerk with "Samuel Phillips & Son, one of Fredericksburg's leading stores" (Kent 1991:3). He worked his way to bookkeeper and formed a partnership with Alexander K. Phillips after Samuel Phillips died in 1855. In 1859, after Alexander Phillips retired, Adams joined with Seth B. French and renamed the firm Adams & French. He married Anne N. Williams in 1850, and they had two children, Samuel A. and Anne F. (Dodd et al. 1999). The doors of the operation closed at the beginning of the Civil War, and Adams "became a clerk in the Confederate Commissary General's office at Richmond and later was appointed Commissary with the rank of captain" (Kent 1991:3). At the end of the war, he came back to Fredericksburg and joined up with his old partner to open a new firm called A.K. Phillips & Co. Adams became City Treasurer of Fredericksburg during the first election under the new Constitution of Virginia and was continuously reelected to this post until his death (Stanton 2011a).

In 1880, Adams is noted as living on the south side of George Street with his second wife, Anne T. Morris; son, Samuel A. Adams; mother-in-law; and two sisters-in-law (U.S. Census 1880). In the 1890s, Adams lived at the corner of Sophia and Frederick Streets on the south side of the railroad (Stanton 2011b). In the spring of 1891, local newspaper articles reported that Adams purchased the lot at the corner of Main (the nineteenth-century name for Caroline Street) and Wolfe streets, and hired a local builder and contractor, George W. Wroten, to erect a "handsome residence" thereon (Fredericksburg Free Lance 1891; Kent 1991:3). The dwelling, which was constructed as a two-story building with a rear one-story ell, was estimated to be valued at $2,050 and at that time, a paint shop facing Wolfe Street was already erected on the property (Figure 3-57) (Kent 1991:5; Sanborn Map Company 1886a, 1891, 1896). Wroten oversaw construction of many buildings in town, including the Mary Washington Memorial Association's caretaker's cottage (111-5262-0014), built circa 1895, and the Virginia Silk Mills Company building (111-0189/111-5297-0015), constructed circa 1890 (Hodge 1981; Johnston and Smith 2001).

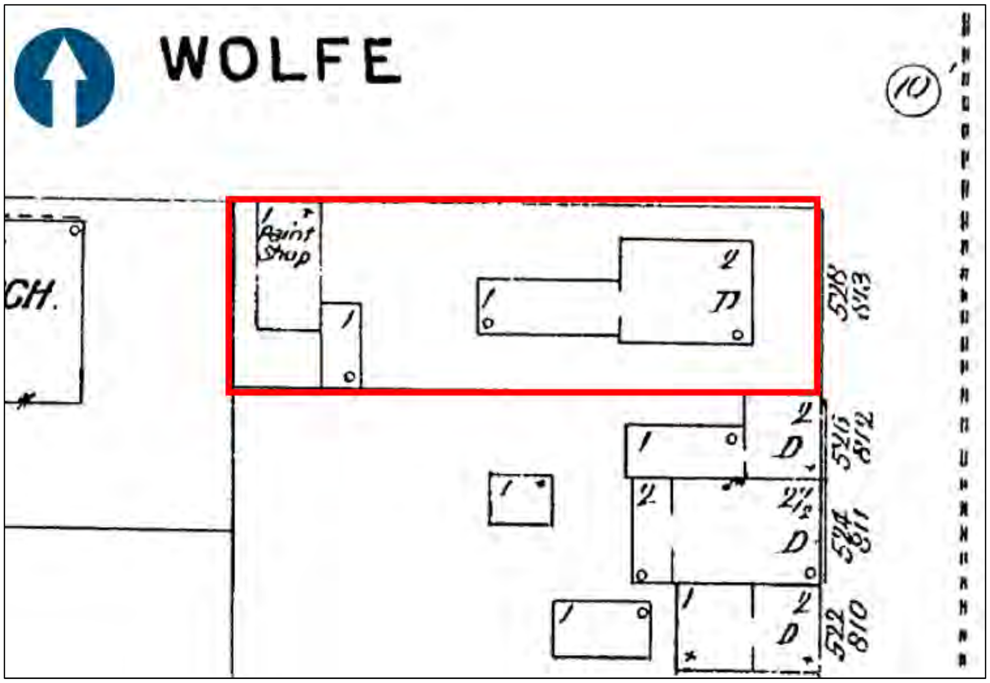

FIGURE 3-57: LOCATION OF THE ROBERT ADAMS RESIDENCE IN 1896 (SANBORN MAP COMPANY 1896) (NOT TO SCALE)

Robert Adams did not reside long in his new home for he died on October 28, 1891 (Kent 1991:4). Although initially heavily mourned and praised immediately after his death, it was reported in the December 1891 that "the late Treasurer's books were short $4,361.55," two times the cost of the dwelling (Kent 1991:4). Ellen C. Gee, a widow and milliner, is noted in the 1892 city directory to be living in the dwelling at 528 Main Street, although the property was known to be involved in a chancery suit during this time as a result of Adams' questionable practices in the treasurer's office (Kent 1991:5; Stanton 2011b).

In 1893, George H. Timberlake and his wife, Amanda M. Timberlake, acquired the property for $2,400, and after the turn of the century sold it to John Edward Timberlake, their son who was a local shoe store owner (Kent 1991; U.S. Census 1900). His shoe business was located at 904 Main Street (Stanton 2011c). In 1910, he opened a millinery with G. Frank Timberlake under the firm name of Crown Millinery Co., in the house on Main Street (Fredericksburg Free Lance 1910; Stanton 2011c). During his ownership, it appears that John Timberlake made several improvements to the dwelling, specifically at the northeast corner with a two-story addition with an open first-story porch, in the south half of the east elevation with a two-story bay window, and north half of the east elevation with an entry porch. He also added two additional one-story outbuildings to the west of the dwelling by the paint shop, which is identified as a shed in 1902 (Figure 3-58) (Sanborn Map Company 1902).

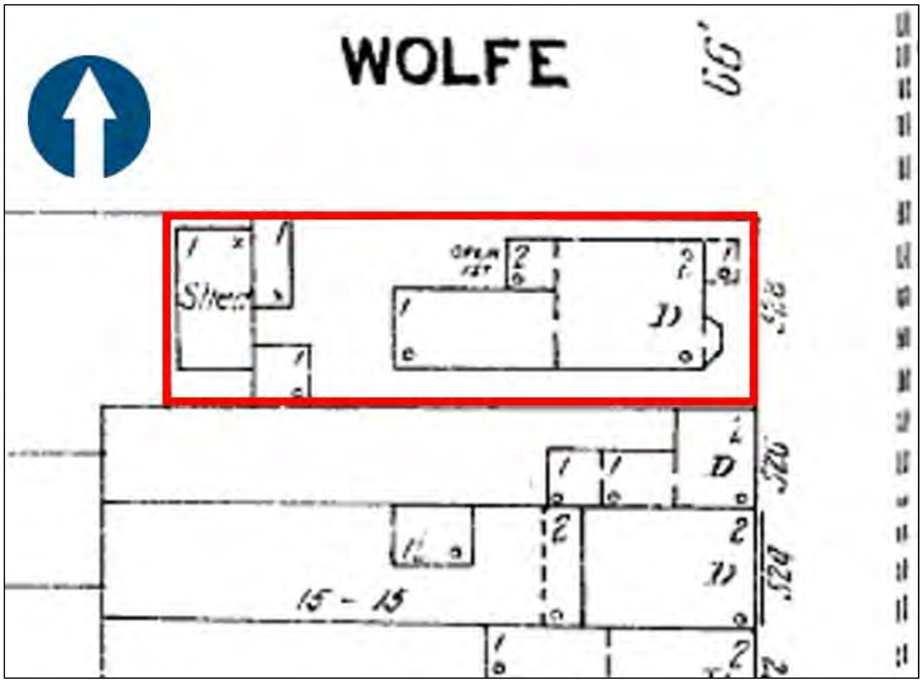

FIGURE 3-58: LOCATION OF THE ROBERT ADAMS RESIDENCE IN 1902 (SANBORN MAP COMPANY 1902) (NOT TO SCALE)

In 1917, John Timberlake moved to Hawke Street and conveyed the property to Emma Hogan, a widow, who sold it two years later to Clayton Simpson (also listed as Simpson Clayton) who in turn sold it to Joseph Ollie for $5,500 (Kent 1991:5; Stanton 2000). The Syrian-born Ollie who migrated to the United States in 1903, lived in the house with his wife, Ella A., for approximately 17 years (Kent 1991; U.S. Census 1930). During this time, they operated a grocery store out of 811 Main Street called The Parlor Grocery and Meat Market (Figure 3-59) (Goolrick 1933; Stanton 2012). In the 1930 Federal Census, Ollie and his wife are noted to be living in Robert Adams Residence; however, in the 1938 Fredericksburg City Directory, Ollie and his wife were living at 920 Marye Street while Robert P. Bayliss, a clerk at A&P Food Stores, rented the house at 528 Caroline (Main) Street (Stanton 2012; U.S. Census 1930).

In 1940, Ollie sold the Robert Adams Residence lot to Nick Govanides, an immigrant from Turkey, who added an extension to the rear of the building in 1945 after the flood of 1942 (CFDB 56:170; Kent 1991). A building permit notes that Govanides hired contractor, W. J. Jett to construct an office for taxi service for $200 (Stanton 2010). Govanides hired Jett again to construct a newsstand at the rear of the building for $500 in 1948 (Stanton 2014). Govanides operated Little Jimmie's Place, a grocery, out of the rear of Robert Adams Residence (denoted as 202 Wolfe Street in city directories) and the Central Lunch at 815 Caroline Street in the 1940s and 1950s (Miller 1945, 1953). In 1978, the property was inherited by James D. and Patricia H. B. Govanides, son and daughter-in-law of Nick Govanides (Kent 1991). Twelve years later in 1984, James and Patricia Govanides sold the property to Edward S. and Stanley R. Beard, who extended and renovated the 1940s extension and opened an antique shop in that portion of the dwelling, called the Century Shop (Kent 1991).

Jacqueline M. "Jackie" and Leopold Charles W. "Chuck" Leopold purchased the house at auction for $913,000 in 2006 and refurbished it to a multi-suite bed and breakfast with the architectural firm Herlong Associates Inc. (CFDB 2006:1415; Fredericksburg Free Lance-Star 2009; The 1890 Caroline House 2018). At that time, the architectural firm utilized windows and fireplace surrounds that had been originally removed during a renovation by previous owners Edward and Stanley Beard, and they dug down the basement to make room for an 8-foot ceiling, which was required at the time for living space (Fredericksburg Free Lance-Star 2009).

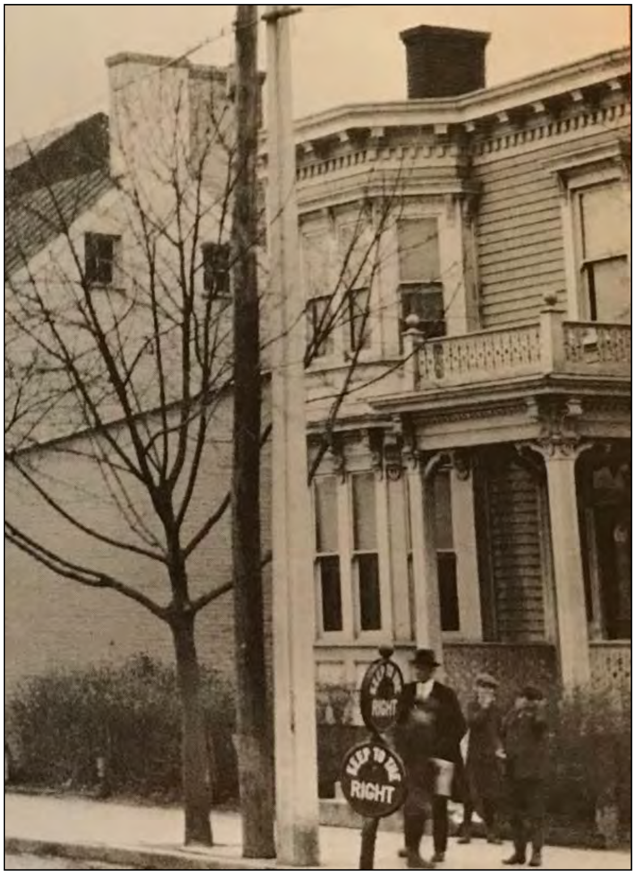

FIGURE 3-59: 1924 PHOTOGRAPH FACING SOUTHWEST ON CAROLINE STREET (SHIBLEY 1976:133)

3.6.2 Architectural Description

3.6.2.1 Primary Resource Exterior

The dwelling known as the Robert Adams Residence is a two-story, two-bay, single-family dwelling constructed circa 1891 with Italianate-style characteristics and detailing (Figure 3-60) (McAlester 2015:282). The rectangular core of the building is set on a continuous brick, slightly raised, basement foundation that supports a frame structural system clad in composite-wood siding with composite-wood corner boards. The building is covered by a shallow hipped roof, which appears flat from ground level, with a thick Italianate-style cornice pierced by two brick interior-end chimneys with metal flues on the southeast side of the building (Figure 3-61). The primary entrance to the building is located on the northeast elevation and is filled by a single-leaf, wood, paneled door with two lights (Figure 3-62). An ornamental transom and side lights accent the door. The door is covered by a one-story, one-bay, flat-roofed porch with wide, overhanging, decorative eaves and supported by wood posts. It is accessed by brick steps with decorative metal railing. Other fenestration on the primary, southwest, and northeast elevations include two-over-two, wood-frame, double-hung-sash windows organized in a four-part, two-story, bay window, and a single two-over-two, wood-frame, double-hung-sash window above the entry porch (Figure 3-63).

Two additions are visible on the southwest end of the original building. A circa-2006, one-story, five-bay addition has a separate entrance on Wolfe Street (Figure 3-64). It is clad in vinyl siding and has a flat roof. Fenestration includes one-over-one, double-hung-sash, vinyl windows and two, multi-light, garage doors. The second addition with a flat roof is not visible from public right-of-way, but interior photographs suggest it was added prior to the 2006 addition, as the exterior siding along the northwest wall is visible from the interior of the newer addition.

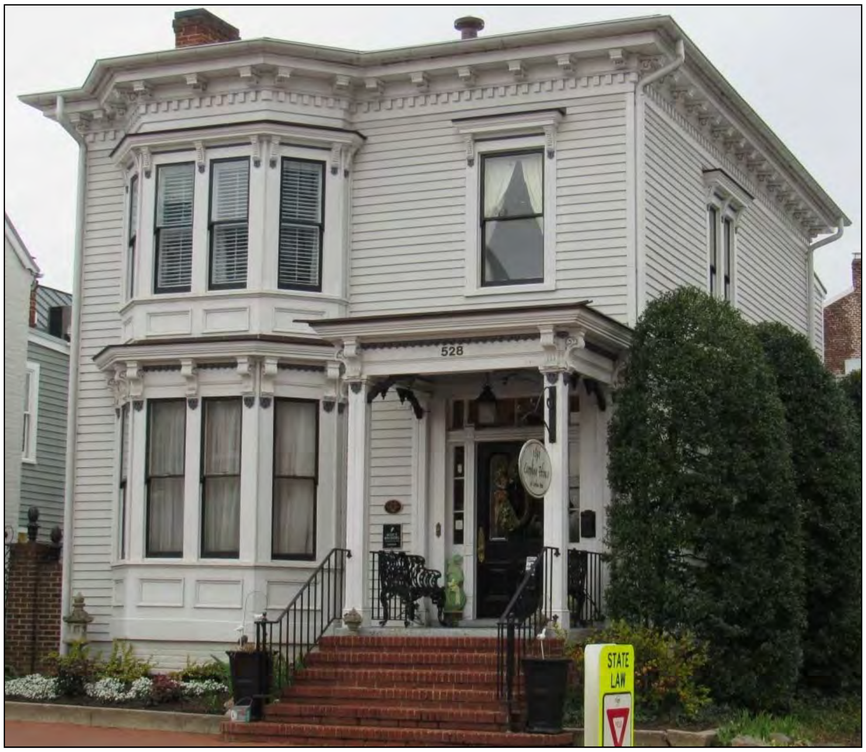

FIGURE 3-61: ROBERT ADAMS RESIDENCE, NORTH OBLIQUE

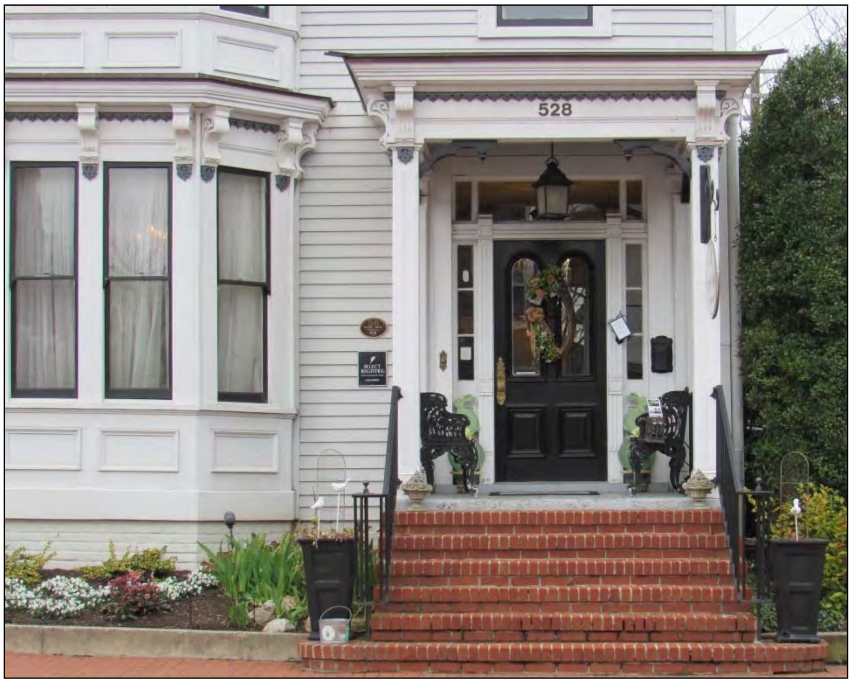

FIGURE 3-62: ROBERT ADAMS RESIDENCE, DETAIL OF PRIMARY ENTRANCE ON NORTHEAST ELEVATION

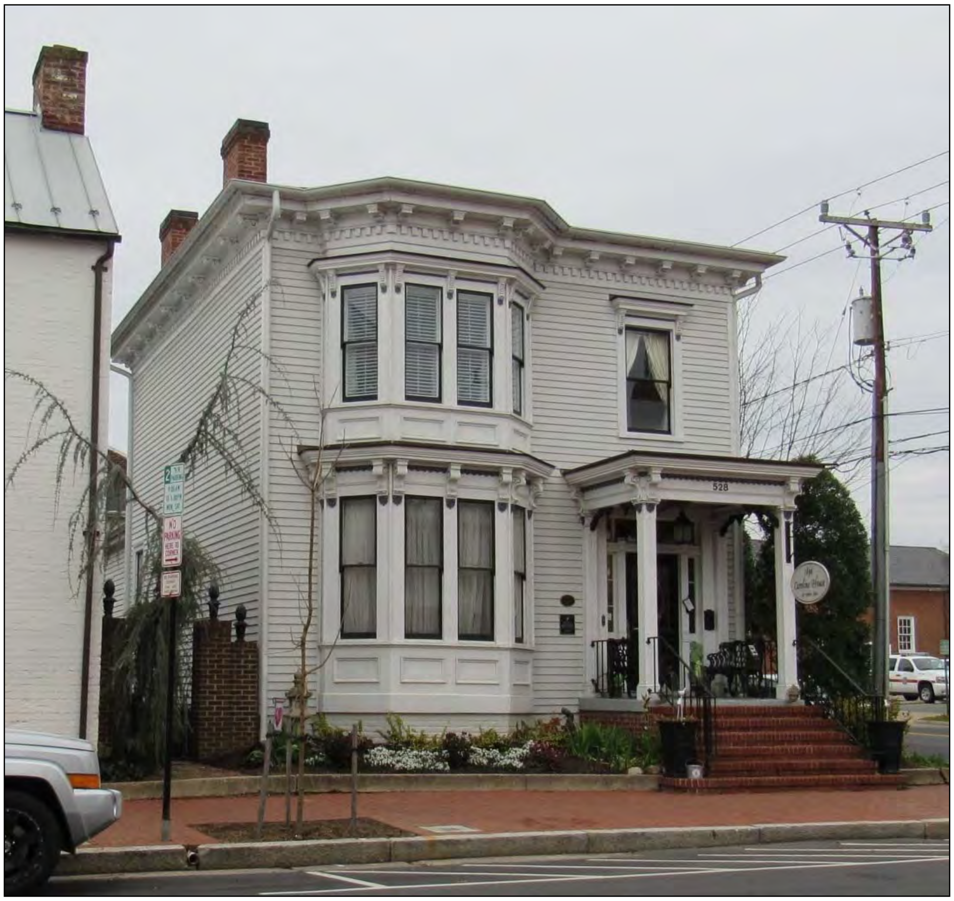

FIGURE 3-63: EAST OBLIQUE

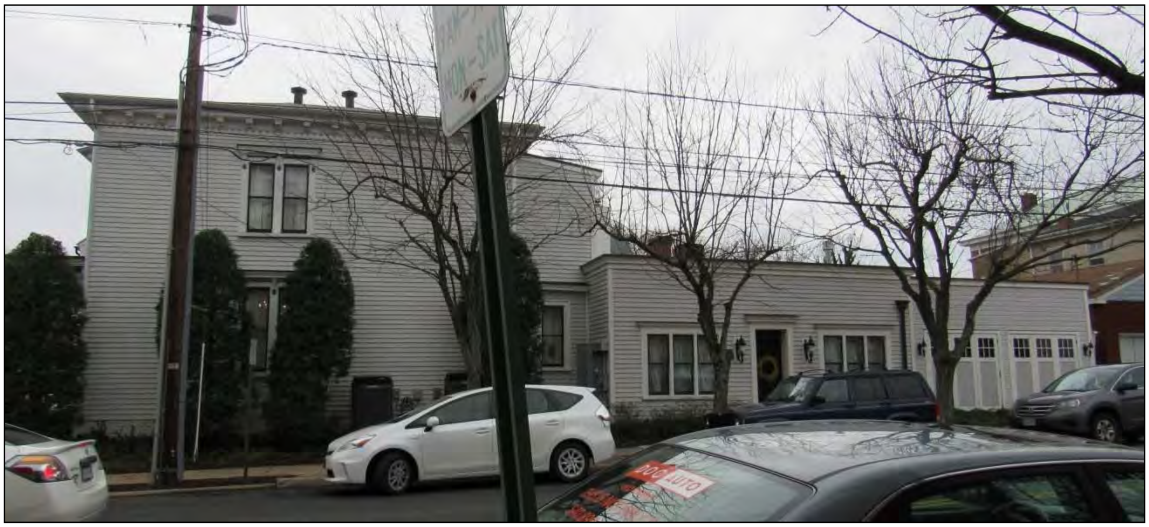

FIGURE 3-64: NORTHWEST ELEVATION FROM WOLFE STREET

3.6.1.2 Primary Resource Interior

Interior access was not permitted during this survey. However, interior photographs are published on the 1890 Caroline House website which indicate a double-pile, side-passage plan, with a staircase leading from the right side of the hallway to the second story (Figure 3-65 through Figure 3-67) (The 1890 Caroline House 2018). The house is enlarged by several additions at the rear and appears to be accessible through the original rooms in the back of the house. After entering through the north elevation, guests walk into a large hall with staircase to the north, and a parlor and dining room to the south. Private spaces, including a guest suite added circa 2006 and a kitchen are located beyond the footprint of the original dwelling, at the west end of the building. Insufficient evidence was gained through this study to determine if interior woodwork is original to the dwelling but appear to be in keeping with the date of construction. A large contemporary kitchen is located within the footprint, as are three multi-room guest suites.

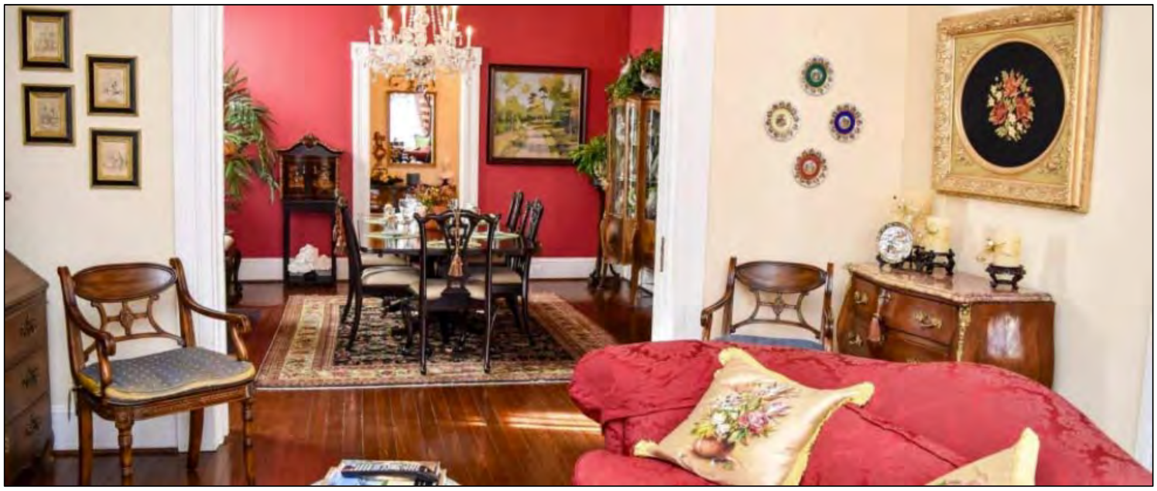

FIGURE 3-67: VIEW OF FIRST-STORY PARLOR AND DINING ROOM, LOOKING WEST (THE 1890 CAROLINE HOUSE 2018)

3.6.3 NRHP Evaluation

The Robert Adams Residence was built in 1891 as a single-family dwelling in the high-style Italianate and has recently been converted to an inn. It is an excellent example of the residential Italianate style in Fredericksburg with its thick ornate cornice, two-story bay window, and rectangular entry porch. Though the building has had some additions at the rear, and interior alterations to accommodate ensuite guest bathrooms on the second floor, the resource retains a relatively high level of integrity in location, design, setting, materials, workmanship, feeling and association.

As outlined by the NPS, "to be considered for listing under Criterion A, a property must be associated with one or more events important in the defined historic context… The event or trends, however, must clearly be important within the associated context… and it must retain historic integrity" (Shrimpton et al. 1990). The Robert Adams Residence is an example of a residential dwelling occupied over the twentieth century by persons of various professions and does not relate strongly to one defined historic context. There are no known associations with significant events or trends at the local, state, or national level. Therefore, this resource is recommended not eligible under Criterion A.

Although Robert Adams was involved in Fredericksburg politics during the late-nineteenth century, he is not known to have had any significant influence in local government nor in any other area of local history. Archival research did not reveal any other associations with significant persons from local, regional, or national history; and as, such it is recommended not eligible under Criterion B.

"Properties significant for their physical design or construction, including such elements as architecture, landscape architecture, engineering, and artwork," could be eligible for the NRHP as under Criterion C (Shrimpton et al. 1990). As defined by the NPS, in order for a property to be eligible under Criterion C, it must "Embody distinctive characteristics of a type, period, or method of construction, represent the work of a master, possess high artistic value, or represent a significant and distinguishable entity whose components may lack individual distinction" (Shrimpton et al. 1990). The Robert Adams Residence is a well-maintained example of Italianate residential architecture. The chamfered porch posts with bracketed cornice are typical of the Italianate style, as are the wide cornices with deep banded trim located on the primary elevation. Window surrounds are complimented by ornate projecting brackets (McAlester 2015:211). There are 23 other Italianate-style single-family dwellings recorded in Fredericksburg, three of which have been formally evaluated and determined not eligible for the NRHP. These resources were found to lack the sophisticated detailing of the Robert Adams Residence. Elmhurst (111-5267) is an example of an Italianate-style dwelling constructed circa 1871 that is listed in the NRHP under Criterion C but is located outside of the Fredericksburg Historic District boundaries; however, it lacks the exterior ornate woodwork as the Robert Adams Residence. No other high-style, Italianate dwellings are located within the boundaries of the Fredericksburg Historic District, rendering this dwelling a unique architectural example of this style in the downtown core. For these reasons, the Robert Adams Residence is recommended as locally significant under Criterion C. As an architectural resource, it was not evaluated under Criterion D.

In addition, the house has been previously identified as a contributing element of the Fredericksburg Historic District (111-0132). As it continues to reflect the history of this area and was constructed with the period of significance for this district, it is recommended to remain a contributing resource to it.

In sum, the Robert Adams Residence is recommended as eligible at the local level under Criterion C and as a contributing element to the Fredericksburg Historic District.

The Robert Adams Residence period of significance begins at the building's year of construction, 1891. The proposed boundaries for the Robert Adams Residence include Parcel 7789-23-1834 in its entirety and contains the single dwelling and additions (Figure 3-68).

3.7 DRY BRIDGE (042-0557)

Dry Bridge (042-0557), also known as a farmstead, is located at 10411 Old Ridge Road (State Route 738) in Ashland in Hanover County, Virginia. Situated on the south side of the road, the 5.5-acre, narrow lot is bordered by the current CSXT railroad right-of-way on the east, historic railroad bed on the west, and the South Anna River on the south (Figure 3-69). Only the northern edge of the parcel is cleared, and it is here that the primary dwelling, associated outbuildings, and a few mature trees and bushes stand. Dense and mature woods cover the remainder, and majority, of the lot. A semi-circular driveway extends from the southern edge of Old Ridge Road to just north of the dwelling. A dirt road spans from the dwelling's east elevation in a southerly direction to the outbuildings. Secondary sources associated with this resource include a number of rabbit pens, chicken coups, dog houses, a shed, and a garage/workshop. A cemetery is associated with the property, though not identified in the current survey.

3.7.1 Historic Context

The primary dwelling known as Dry Bridge dates to at least the mid-nineteenth century, although some local history records suggest that it was constructed in the early 1800s. Because Hanover County experienced a loss of records, including deed, plat, and tax books, during the Civil War, determining the exact date of construction and uncovering its early history was not possible during the current investigation. One local account suggest that it was constructed in 1854 and functioned as an overseer's cottage for Samuel Martin Baker (V-CRIS 2018).

The earliest account of the property in deed records is on August 22, 1868, when John W. and Jennie Haskins sold a 10-acre property on the east side of the RF&P Railroad to Samuel M. Baker, Sr. (Hanover County Deed Book [HaCDB] 4:242). Little is known about John W. Haskins (also sometimes written as Hoskins), except that he was born around 1825 in Virginia and died in September 1899 (Confederate Pension Rolls, Veterans and Widows 1900; U.S. Census 1860). He worked as a farmer and married Virginia "Jennie" Flora Mallory and together they had eight children (U.S. Census 1860, 1880).

By 1863, the Civil War had taken a toll on much of central Virginia; in early July, the Haskins found themselves in the middle of a raid by Union soldiers. These troops had been charged with the task of destroying the railroad lines north of Richmond with a focus on two railroads where they crossed the South Anna River: the RF&P Railroad and the Virginia Central Railroad (VCR) bridges. According to a survey completed by the National Park Service, the DHR, American Battlefield Protection Program, the Richmond National Battlefield Park, and Hanover County, "the two attacks on the railroad bridges north of Richmond only briefly disrupted rail service into the capital. While [the VCR] bridge was destroyed a few miles away, the RF&P remained open" (Hanover County Historical Commission 2002:30). Although surrounded by Union and Confederate troop advancements and a series of earthworks, the Haskins' house known as Dry Bridge is believed to have survived (Figure 3-70) (Hotchkiss Map Collection 186?). Without surviving land records, it is difficult to determine whether the property was previously owned by the neighboring Baker family, however, it is clear that the resource was in Haskins possession during the Civil War, casting some doubt on the notion that it was the family's overseer cottage.

Figure 3-69
Location of the Dry Bridge/ Farmstead, 10411 Old Ridge Road (042-557)

04/2018

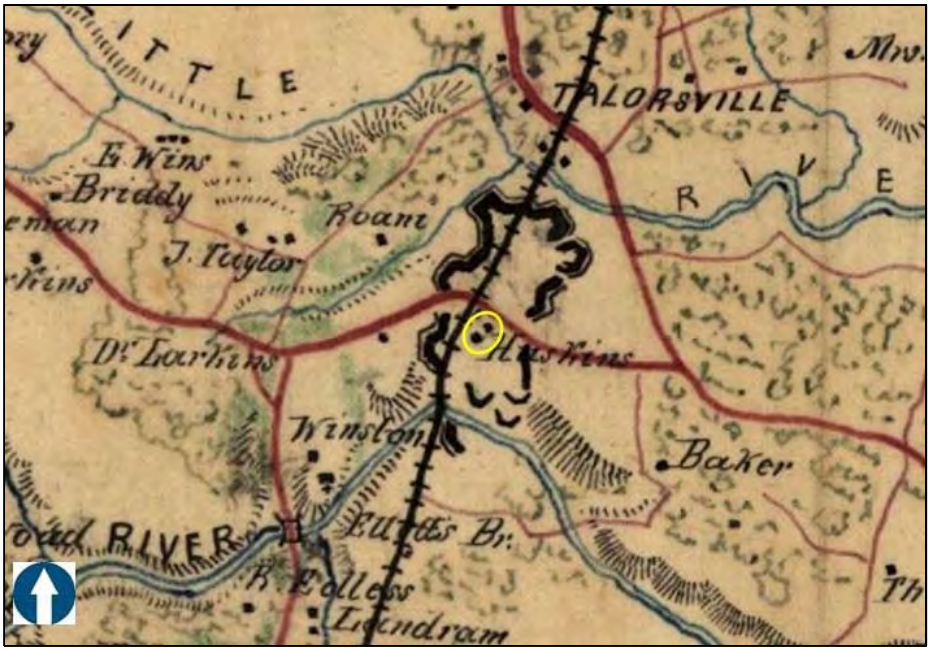

FIGURE 3-70: CIVIL WAR-ERA MAP OF THE NORTHERN PORTION OF HANOVER COUNTY (HOTCKISS MAP COLLECTION 186?). DRY BRIDGE, THEN OWNED BY THE HASKINS FAMILY, IS NOTED IN YELLOW. (MAP NOT TO SCALE)

The next owner of Dry Bridge, Samuel Baker, Sr. (1816–1890), married Mary A., and worked as a farmer on property which neighbored the Haskins's to the east on the south side of the Old Ridge Road and east of the current Interstate Highway 95 (I-95) corridor (Hotchkiss Map Collection 186-; U.S. Census 1870). During the mid-nineteenth century, Samuel Baker operated his farm and house in northern Hanover County using the labor of approximately 18 enslaved persons (United States Federal Census-Slaves Schedules [U.S. Slave Schedules] 1850, 1860; U.S. Census 1840). After owning the Dry Bridge property for just over 10 years, Samuel, Sr. sold it to his son, Samuel M. Baker, Jr. for $300 in 1887 (HaCDB 22:217). In 1902, Baker sold land to the RF&P Railroad Company for the realignment of the railroad line at the South Anna River crossing, reducing the parcel to 5.5 acres. The landscape today reflects this change, as the tracks west of the Dry Bridge property were abandoned and the company laid new ones just east of the house and constructed a new bridge across the South Anna River approximately 430 feet downstream (Figure 3-71) (HaCDB 41:66; Hanover County Plat Book [HaCPB] 3:97).

Dry Bridge continued to be owned by known descendants of Samuel M. Baker, Jr. until the 1980s when the surviving widow of his great-grandson, Conway D. Thompson, sold it to John G. and Donna H. Duggan, Jr. (HaCDB 529:545; Hanover County Tax Record Book [HaCTRB] 1923; Hanover County Will Book [HaCWB] 7:125). The Duggan family owned the property until the current occupants, Paul B. Boulden, Jr. and Kimberly A. Boulden, purchased Dry Bridge in November 2009 (HaCDB 2966:1292).

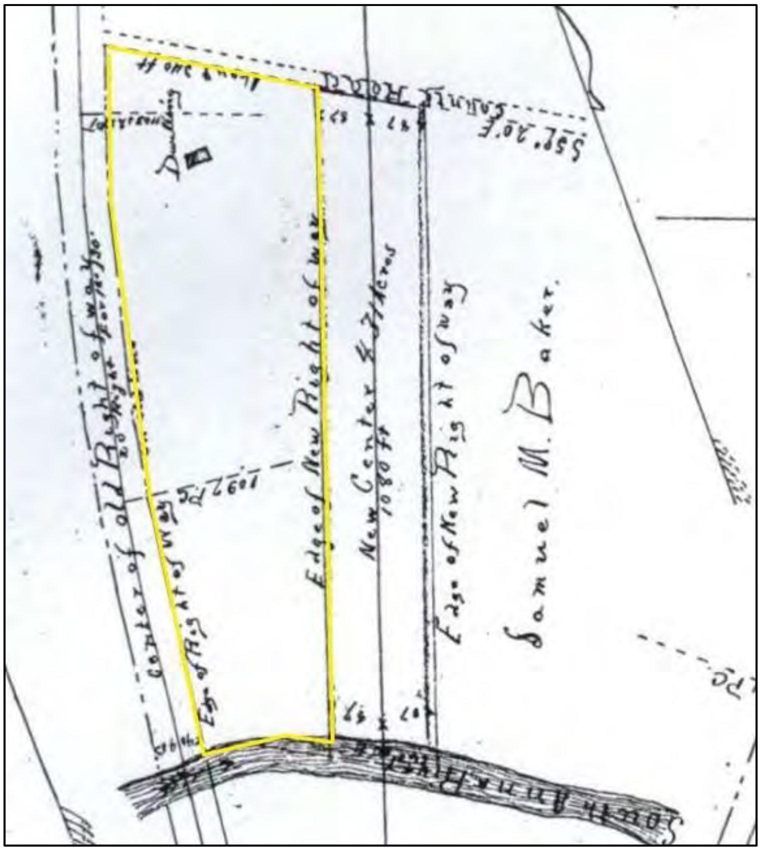

FIGURE 3-71: 1902 PLAT SHOWING THE DRY BRIDGE PROPERTY (042-0557) IN YELLOW AND THE OLD RF&P RAILROAD ROW TO THE WEST AND THE NEW RF&P RIGHT OF WAY ON THE EAST (HACPB 3:91) (MAP NOT TO SCALE)

3.7.2 Architectural Description

3.7.2.1 Primary Resource Exterior

The primary resource at Dry Bridge is a two-story, three-bay, I-house dated to around 1854 with later-nineteenth-century Folk Victorian details added (Figure 3-72 and Figure 3-73). According to previous surveys, the dwelling was originally a two-story, two-bay, side-passage dwelling with a two-story, two-bay addition later made to create the central-passage, I-house form (V-CRIS 2018). This house historically rested on a brick pier foundation, though now it contains concrete-block infill. The frame structural system is clad in weatherboard with wood corner boards and the building is covered by a moderately pitched, side-gabled roof sheathed in wood shingles and features boxed eaves. One exterior-end, brick chimney and one interior-end, brick chimney were observed at either gabled end (east and west elevations) of the main massing of the building.

The primary entrance, filled with a single-leaf, half-glazed, wood door, is centered on the façade (north elevation). Other fenestration includes single, six-over-six, wood-frame, double-hung-sash windows. All windows and entrances feature simple wood enframements. No windows were visible in the east or west elevations of the core of the building (Figure 3-74). A one-story, full-width, wood porch lines the façade and is set on a continuous brick foundation. The porch is covered by a shed roof sheathed in standing-seam metal and is supported by a combination of chamfered and turned wood posts with decorative sawn, wood brackets. The chamfered posts are located in the center bay, framing the primary entryway to the dwelling.

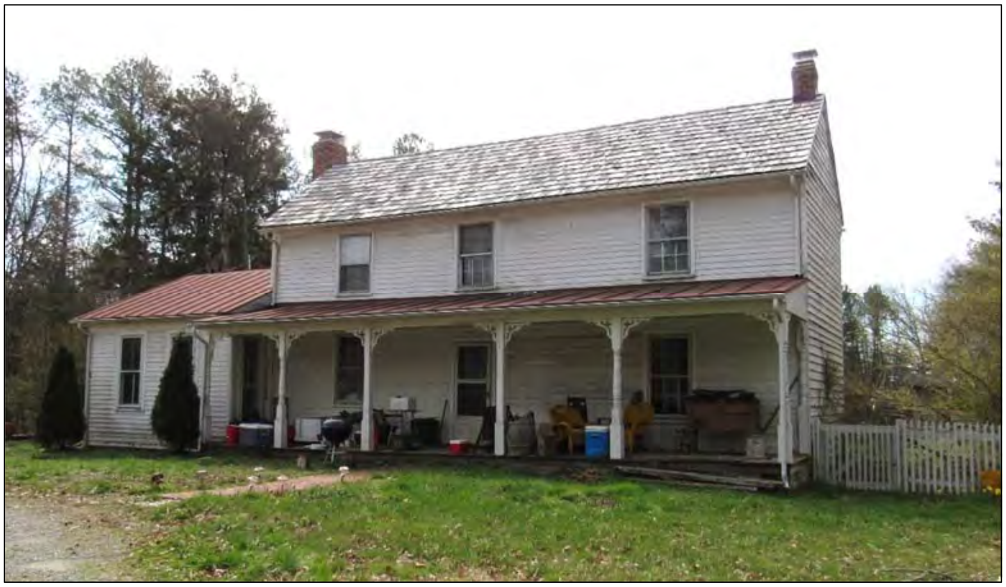

FIGURE 3-73: DWELLING AT DRY BRIDGE, NORTHWEST OBLIQUE

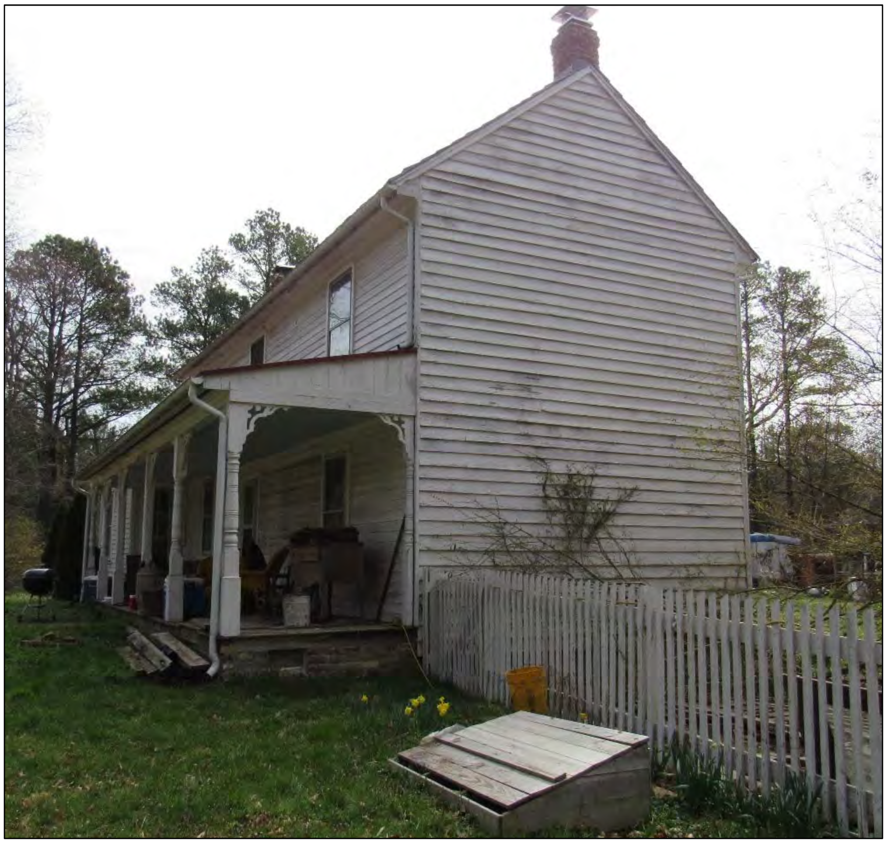

FIGURE 3-74: DWELLING AT DRY BRIDGE, WEST ELEVATION

The core of the building features multiple additions primarily extending from the east elevation and continuing south (Figure 3-75). An early-twentieth-century, one-story, two-bay, side-gabled addition extends from the east elevation. It is set on a continuous brick foundation and the frame structural system in clad in the same materials as the core. The roof, with close boxed eaves and partial returns on the east elevation, is sheathed in standing-seam metal. Fenestration in the addition includes two-over-two, wood-frame, double-hung-sash windows and a single-leaf, paneled, wood door with simple wood surround. The entrance is accessed by a wood entry stoop with a set of three concrete steps. Remnants of a porch are visible on the east elevation around the entryway (Figure 3-76) (Google 2012). Two late-nineteenth- to early-twentieth-century, one-story, gabled additions protrude from the south elevation of the early-twentieth century addition. They are clad in the same materials as the core, and an interior-end, brick chimney pierces the eastern roof slope in the south half of the addition nearest the late-nineteenth-century addition. The southernmost addition features wide overhanging eaves. Centered in the south elevation is a gabled addition. Although it was not observed during this survey, it was noted on current online aerials (Google 2018). Also identified on aerials is a shed addition connecting the central south addition and the eastern addition, not visible from public right-of-way.

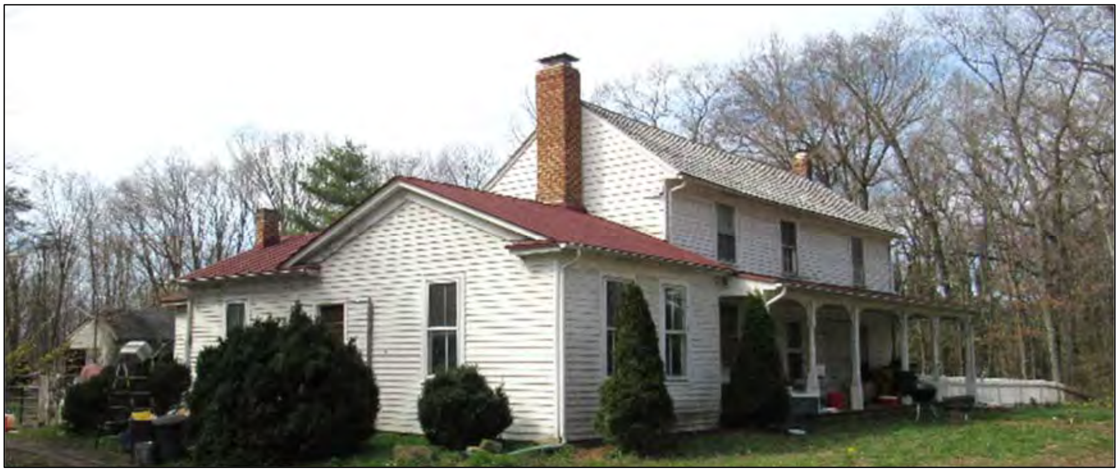

FIGURE 3-75: DWELLING AT DRY BRIDGE, NORTHEAST OBLIQUE

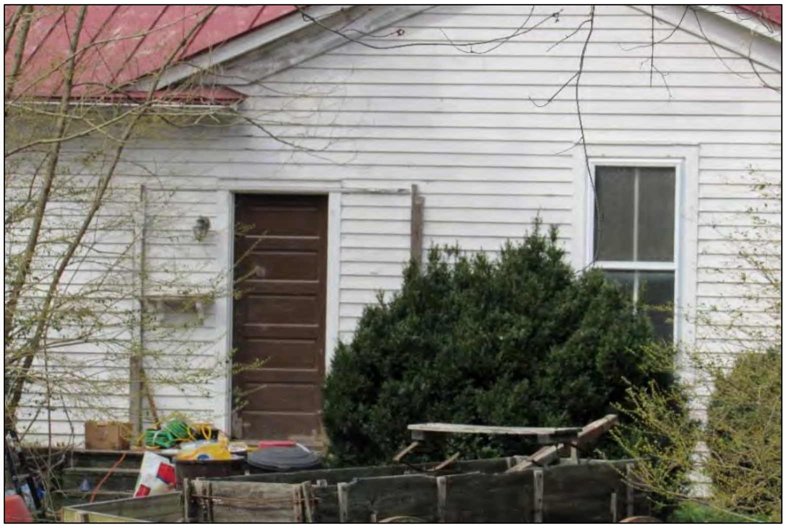

FIGURE 3-76: DWELLING AT DRY BRIDGE, DETAIL VIEW OF SECONDARY ENTRANCE IN EAST ELEVATION OF EARLY-TWENTIETH CENTURY ADDITION

3.7.2.2 Primary Resource Interior

Interior access was not granted during the current survey.

3.7.2.3 Secondary Resources

A circa-1960, one-story, three-bay, concrete-block, workshop is situated south of the dwelling (Figure 3-77). The masonry building is covered by a moderately pitched, asymmetrical side-gabled, asphalt-shingled roof with exposed rafter tails. An interior-slope chimney pierces the roof in the south side of the roof ridge; its material was not visible during the time of survey. A double-leaf, board-and-batten door marks the east elevation lined with a thick, wood lintel above while three metal-framed windows dot the north elevation. Most of the windows are missing panes. Three circa-1990, half-story, wood-frame, chicken coops sit immediately north of the circa-1960 workshop (Figure 3-77). The middle coop is covered by a side-gabled, wood-shingled roof while the eastern and western coops are covered with a flat, particle-wood board. All the coops are enclosed in a combination of vertical wood board and chicken wire.

Just south of the circa-1960 workshop is a circa-1960, one-story, one-bay, frame shed clad in plywood board and covered by a front-gabled roof. The entrance is located in the east elevation and is left open. South of both the workshop and shed is a circa-2017, one-story, two-bay, wood-frame, animal shelter (Figure 3-78). It is partially clad in wood siding with the east elevation left completely open. The shelter is covered by a shed roof sheathed in pressed metal.

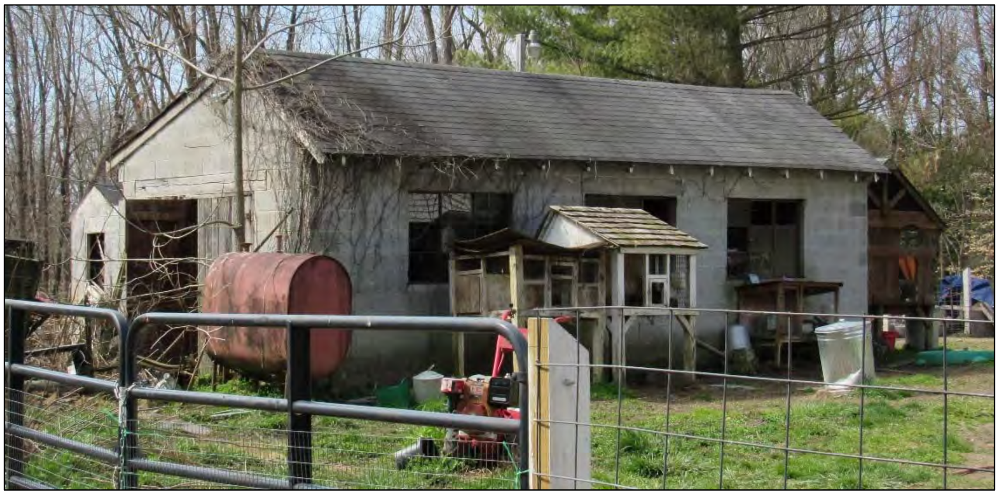

FIGURE 3-77: CIRCA-1960 WORKSHOP AND THREE CIRCA-1990 CHICKEN COOPS, NORTHEAST OBLIQUE

A circa-1980, one-story, wood-frame, chicken coop is located immediately west of the circa-1960 workshop. It is covered by a front-gabled shed with a faux-brick chimney flue piecing the east side of the roof ridge. The coop is clad in a combination of vertical wood board and chicken wire. West of this resource and southwest of the dwelling is a circa-2017, half-story, single-bay, animal shelter. It is clad in vertical wood board and covered by a front-gabled roof; the north elevation is left open.

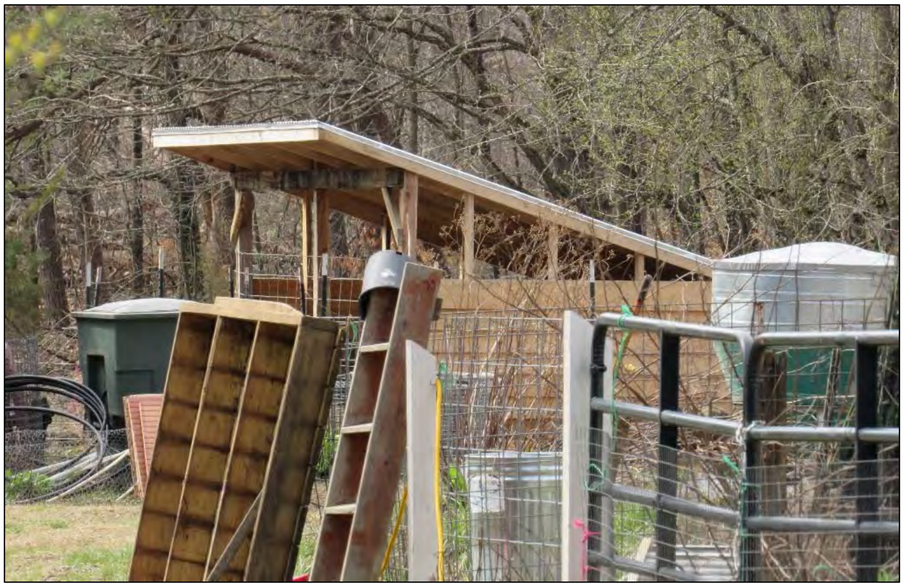

FIGURE 3-78: CIRCA-2017 ANIMAL SHELTER, LOOKING SOUTHWEST

A cluster of three circa-1980, wood-frame, chicken buildings is located east of the dwelling in a penned area created by chicken wire (Figure 3-79). The structure nearest to the dwelling is a shed-roofed coop clad in vertical wood boards, while the structure just east is clad in plywood board and covered by a shed roof sheathed in pressed metal. Single-leaf wood doors are utilized to access the animals. The third structure is an A-shaped, wood-frame shelter, clad in a combination of plywood board and pressed metal, and it is the northernmost structure of this cluster of outbuildings.

A circa-2016, shed-roofed, wood-board storage or animal trap structure is located northwest of the resource and immediately north of the picket fence (Figure 3-79).

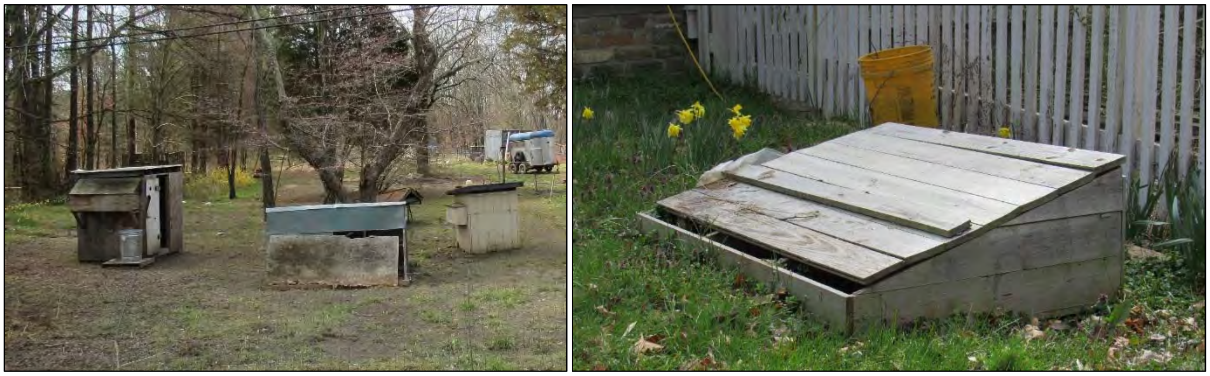

FIGURE 3-79: CIRCA-1980 CHICKEN BUILDINGS, LOOKING SOUTH (LEFT); POSSIBLE STORAGE OR ANIMAL TRAP STRUCTURE, LOOKING SOUTHEAST (RIGHT)

The circa-1900 Baker-Thompson Cemetery was not observed during the current survey nor are there indications of a cemetery on historic maps; however, it was noted during a 1991 survey of the property (V-CRIS 2018). During that survey, 10 plain granite markers were observed ranging from 1900 to the most recent interment in 1967. A free-standing sculpture and cast-iron urn were also recorded at that time, though it is unclear where the cemetery is located in relation to the primary dwelling. The cemetery is not apparent in aerial photographs; more information is needed to confirm its condition and location.

3.7.3 NRHP Evaluation

Dry Bridge was one of many small farms that dotted Hanover County's rural landscape throughout the nineteenth century (V-CRIS 2018). Situated between the RF&P Railroad, the South Anna River, and a country road, known today as Old Ridge Road, this mid-nineteenth-century dwelling and associated outbuildings exemplify the typical property type in this region in the mid- to late-nineteenth century. Currently, the building is in fair condition, retaining a relatively high level of integrity of location, setting, feeling, and association and a moderate level of design, materials, and workmanship. Although it is noted on Civil War-era maps, no evidence was uncovered during this study to depict any role the house, property, or its occupants might have played during battles in this area (Hanover County Historical Commission 2002). The property is not known to be associated with any other event or historical trend at the local, state, or national level. For these reasons, Dry Bridge is recommended not eligible for individual listing in the NRHP under Criteria A.

Eligibility of a resource for the NRHP under Criterion B is defined as needing to be associated with a person who is "individually significant within a historic context" and has "gained importance within his or her profession or group" (Shrimpton et al. 1990). None of the owners or residents of the property are known to have been particularly important in any context at the local, regional, or national level; and therefore, Dry Bridge is also recommended not eligible under Criterion B.

The dwelling and primary resource at Dry Bridge evolved, starting as a single-pile, side-passage house and progressing into an I-house with the addition of a two-story, single-pile section typical of Hanover County (V-CRIS 2018). The single-story section on the east end of the building as well as the Victorian-style porch were later additions. There are 13 houses built between 1825 and 1855 in Hanover County which are listed as eligible or potentially eligible for the NRHP, several of which have surviving contributing historic outbuildings. The primary resource at Dry Bridge has been heavily modified and no longer retains any outbuildings from its period of construction. Therefore, the DC2RVA teams recommends it not eligible under Criterion C. As an architectural resource, this was not assessed under Criterion D.

In sum, Dry Bridge **is recommended not eligible under Criteria A–C.**

3.8 BERKLEYTOWN HISTORIC DISTRICT (166-5073)

The Berkleytown Historic District (166-5073), a neighborhood in Ashland in Hanover County, Virginia, is located directly to the east of the RF&P Railroad and about 0.5 mile north of the downtown core in an area that was not annexed until 1977 (Figure 3-80). It is a historically African-American residential community that was created as a result of racial segregation and a 1911 Ashland segregation ordinance (Shalf 1994:124). Two main roads intersect though Berkleytown: Henry Street, which runs north to south, and Berkley Street, which runs east to west. A Street and B Street run perpendicular to each other in the southwestern part of the neighborhood and School Street runs north from Berkley Street to the former John M. Gandy High School, which now serves as Hanover County Public School Board. North Center Street and the railroad bound the neighborhood to the west and Vaughn Road creates the northern border. Development within the district boundaries spans from around 1900 to present day and comprises approximately 85 resources. Property types within the Berkleytown Historic District include residential, commercial, and educational buildings.

3.8.1 Historic Context

3.8.1.2 History of Housing Discrimination in Ashland

Ashland was first developed in 1840 by the RF&P Railway Company as a mineral spring resort called "Slash Cottage" (Figure 3-81). The resort was very popular and soon residential plots were created on land adjacent to the resort and sold on the condition that a house would be built on the lot within 18 months of purchase. The town grew steadily, incorporating in 1858. At the onset of the Civil War, it had a population of about 200 (The Ashland Museum n.d.a). "Slash Cottage" is now known as Ashland.

Following the Civil War and until World War I, Ashland, as well as the rest of the South, went through a period of economic depression. Virginia's banking systems had collapsed, people were displaced, and the RF&P Railroad, which served as the primary financial driver for the town, was struggling to recoup losses from damage and its heavy investment in Confederate bonds (Shalf 1982). Tourism, another of Ashland's main antebellum industries, was also almost nonexistent after the Civil War as luxuries such as resort vacations and horse racing were beyond the daily means of the majority of the population (Shalf 1994:84).

During this time, the African-American population in Ashland faced many of the same struggles that other newly freed slaves encountered all across the South. Though they had been granted their freedom, many white residents pursued a myriad of avenues to preserve their pre-war way of life. One way to maintain their segregation was through the use of racial covenants on land use, often written into deeds to prohibit the sale or inhabitation of certain properties by non-caucasian individuals. These covenants began to appear in Ashland shortly after the Civil War. An example of this is in an 1886 deed for the Hugo House (166-0037/166-0001-0073) on Center Street (HaCDB 21:34). The deed reads: "She or her heirs will cause to be erected on said land a dwelling house for the occupancy of a white family… If she or heirs breaches contract then deed will become null and void" (HaCDB 21:34).

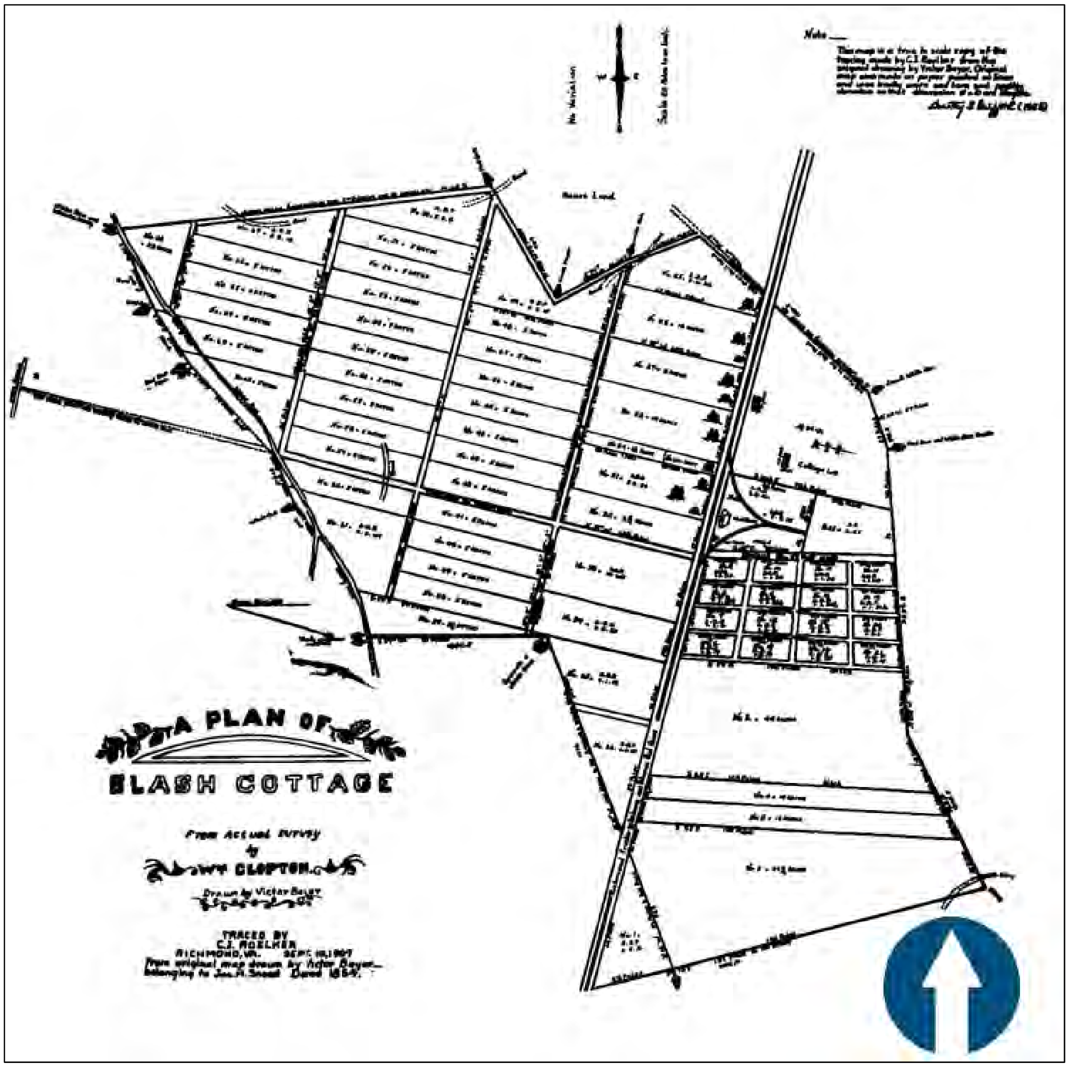

FIGURE 3-81: 1854 PLAT SHOWING THE PLAN FOR SLASH COTTAGE (THE ASHLAND MUSEUM N.D.A) (MAP NOT TO SCALE)

In September 1911, Ashland further institutionalized physical segregation by enacting a Segregation Ordinance, modeled off of a similar, recently enacted Richmond Ordinance. This ordinance declared it illegal for:

> …any person to occupy as a residence or to establish and maintain as a school or place of public assembly and house upon any street or alley between two adjacent streets on which a greater number of houses are occupied [by members of another race] (Stephenson 1914:12–13).

This ordinance, unlike some others in different cities, attempted to legislate the entire town instead of dictating which blocks were illegal for African Americans habitation, including both owned and rented land (Stephenson 1914:14-15). The constitutionality of the ordinance went before the Circuit County of Hanover in 1913 in the case *Town of Ashland vs. Coleman*, but it was upheld, with the judge stating it was "not oppressive because it applied to white people and negroes alike" (Stephenson 1914:14–15).

3.8.1.2 Development of Berkleytown

Due to the postbellum housing discrimination African Americans were experiencing in Ashland, even before the 1911 ordinance, many began to settle right outside of the town's incorporation line. This settlement was somewhat piecemeal and took place over about 20 years.

In 1894, the estate of Edward Berkeley, who had been a large landowner in Hanover County, subdivided seven lots just north of Ashland along a county road which would later be renamed "Berkley Street" (Figure 3-82). Initial development in Berkleytown occurred along Berkley Street and Henry Street and it is along those roads where the oldest homes in the neighborhood are located, consisting primarily of bungalows and two-story vernacular dwellings (Figure 3-83) (The Ashland Museum n.d.b). It appears that some of the earliest homes along Berkley Street were originally built and inhabited by white residents, but by the 1920s, most of the houses were owned by African Americans (U.S. Census 1910, 1920). Around that time, the frame school for white children in Ashland was replaced with a more permanent brick building, and the older building was moved to Berkley Street to serve the African American community in the area (Shalf 1994:146). This school served as a very important part of the community and would become the Hanover County Training School and later the John M. Gandy High School. For more information on the evolution of the school see page 3-96.

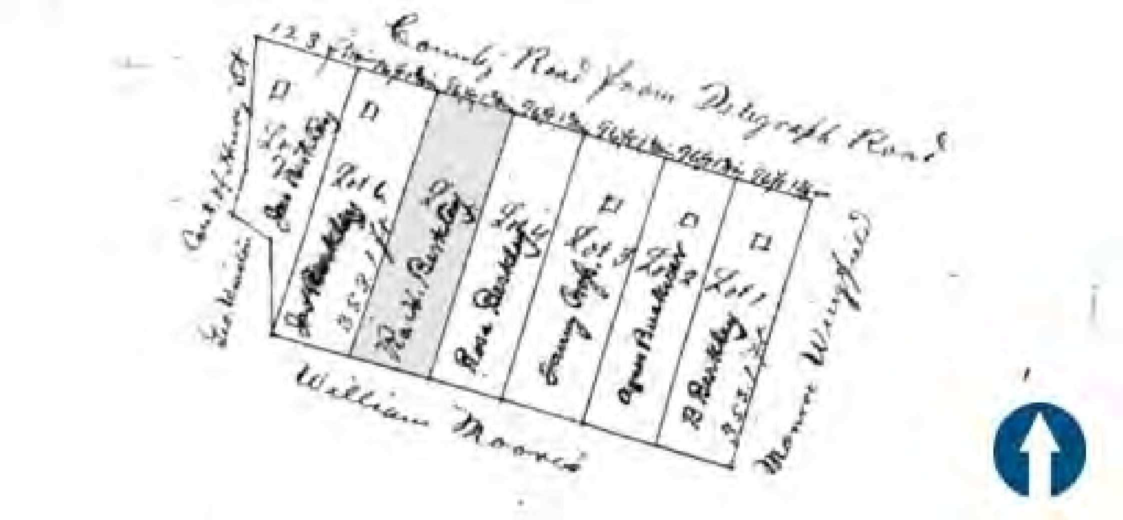

FIGURE 3-82: 1894 PLAT OF THE SEVEN ORIGINAL LOTS ON BERKLEY STREET (THE ASHLAND MUSEUM N.D.B) (MAP NOT TO SCALE)

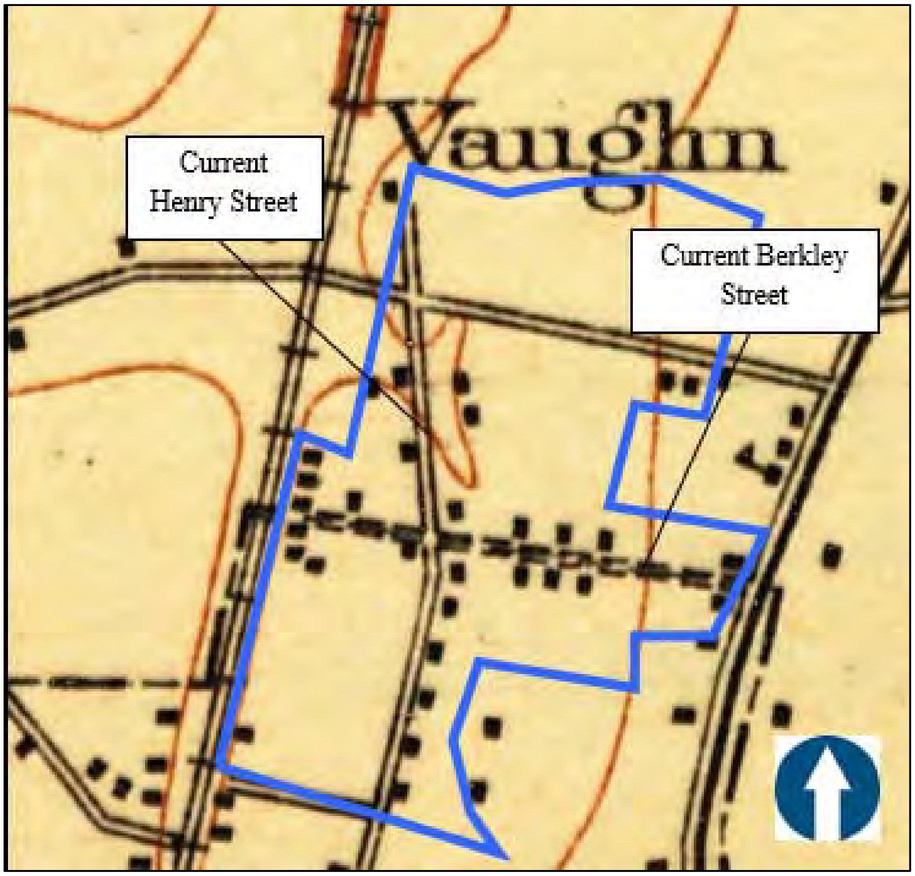

FIGURE 3-83: BERKLEYTOWN HISTORIC DISTRICT (IN BLUE) ON A 1918 USGS 7.5-MINUTE TOPOGRAPHIC QUADRANGLE MAP OF ASHLAND, VIRGINIA (USGS 1918) (MAP NOT TO SCALE)

In 1922, the area located to the southwest of the intersection of Berkley and Henry streets was platted, creating A and B Streets (Figure 3-84) (HaCPB 7:147). These lots appear to have initially been purchased solely by African Americans, though development of this area largely occurred between 1950 and 1960 (Figure 3-85). These lots are smaller than the parcels along Berkeley Street and Henry streets, and the architecture of these houses reflects Minimal Traditional and Transitional Ranch styles.

In 1977, the Berkleytown neighborhood was formally annexed into the Town of Ashland (The Ashland Museum n.d.b).

3.8.2 Architectural Description

The neighborhood of Berkleytown is typical of many small-town, twentieth-century, African-American neighborhoods in that it was originally relatively isolated from the formal downtown core, is now subsumed within town development plans, and is dotted with small vernacular dwellings (see Figure 3-80) (Shalf 1994:124). The buildings within the district were constructed between 1900 and the present, and consist almost entirely of residential dwellings, but also contains a funeral home and a large educational complex (Figure 3-86). The main roads though Berkleytown are Henry Street, Berkley Street, A Street, B Street, and School Street, which runs north from Berkley Street to the former John M. Gandy High School. Residential buildings line all of the streets, with the oldest resources clustered around the intersection of Henry and Berkley Streets. The east side of Henry Street and the north side of Berkley Street are lined with public sidewalk and the lots within the district are spotted with a mix of deciduous and coniferous trees, shrubbery, and plantings (Figure 3-87).

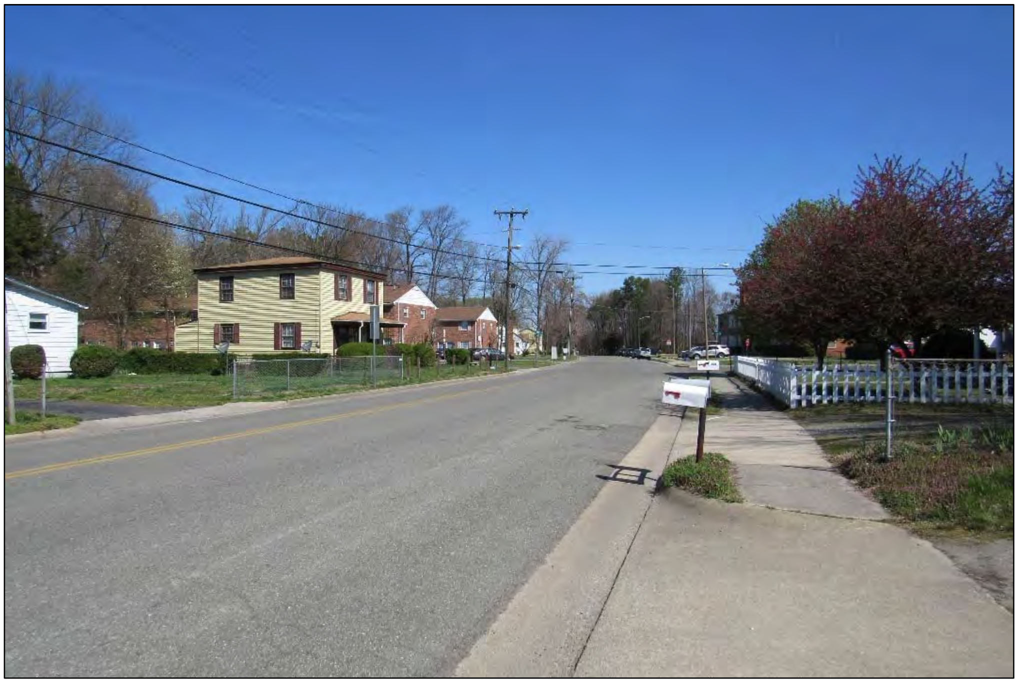

FIGURE 3-86: STREETSCAPE VIEW OF HENRY STREET, LOOKING NORTH

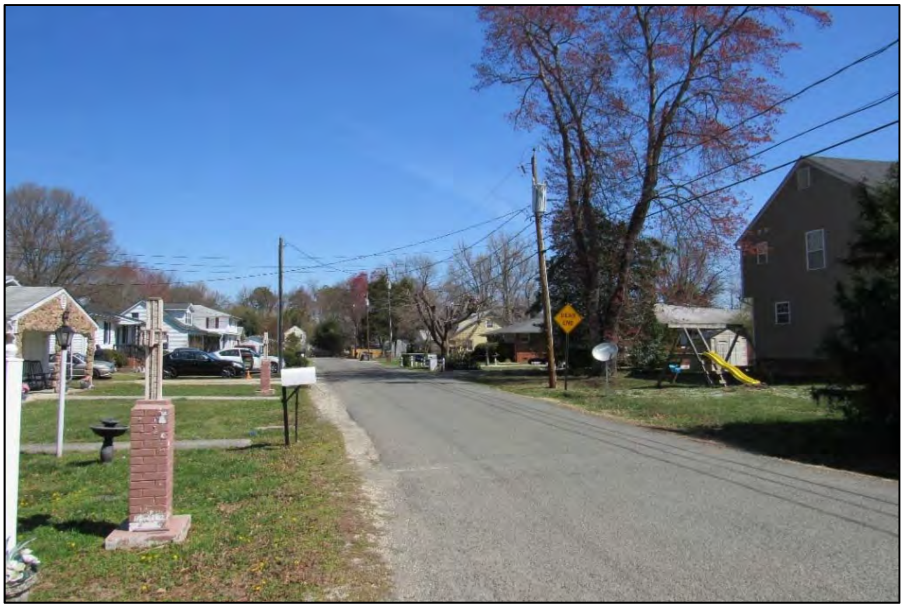

FIGURE 3-87: VIEW OF B STREET FROM THE INTERSECTION WITH A STREET, LOOKING NORTH

The architectural styles of the residential buildings included within the district boundaries reflect trends seen through this region of Virginia during the early- to mid-twentieth century. Residential resources constructed between 1900 and 1930, mainly concentrated along Berkley and Henry Streets, are predominantly a two-story vernacular form or a one-and-a-half-story bungalow form, many with Craftsman style influences (Figure 3-88 and Figure 3-89). An exception to that is the house at 203 Berkley Street which has a simplified Queen Anne style and is a Sears & Roebuck kit home (Figure 3-90) (The Ashland Museum n.d.b). These resources generally maintain the original form and massing, but have experienced many replacement materials such as windows, siding, porches, and foundation.

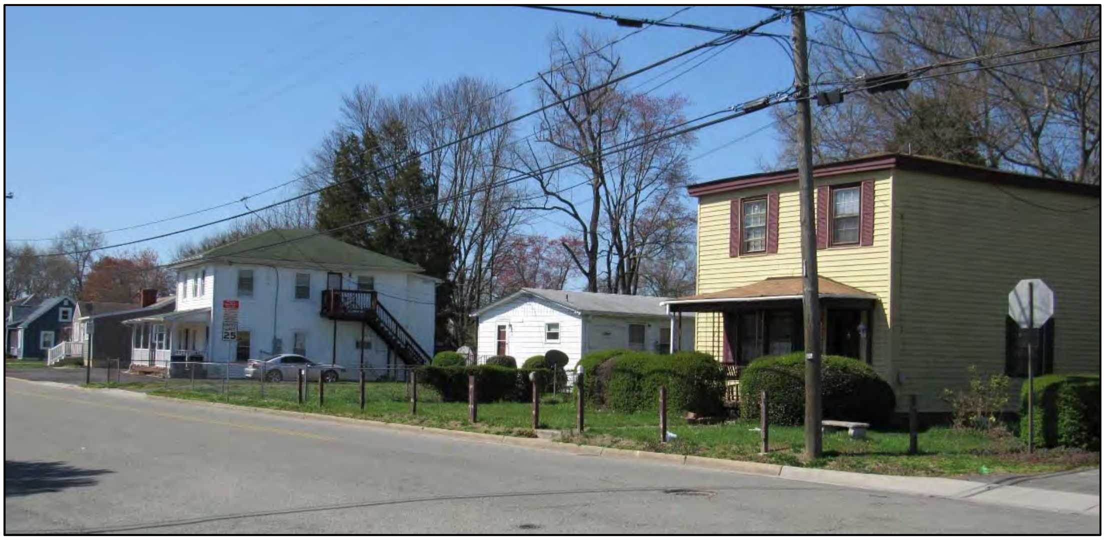

FIGURE 3-88: DWELLINGS ALONG HENRY STREET, LOOKING SOUTH FROM INTERSECTION WITH BERKLEY STREET

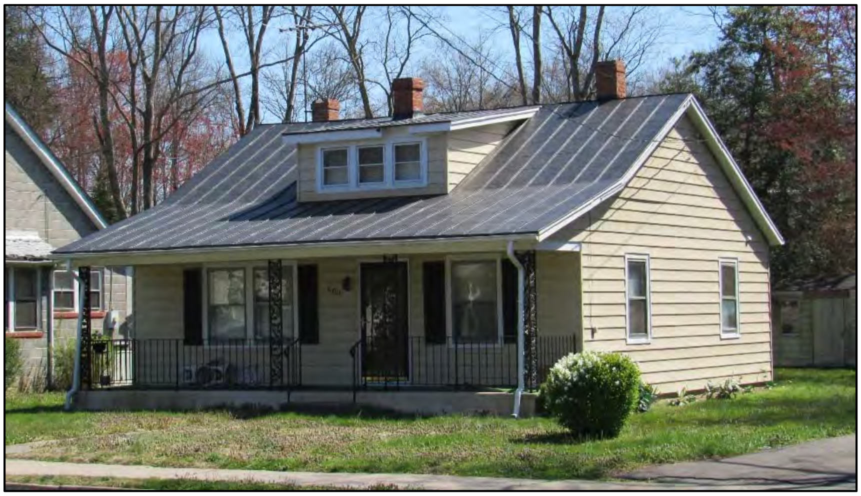

FIGURE 3-89: 603 HENRY STREET, SOUTHWEST OBLIQUE

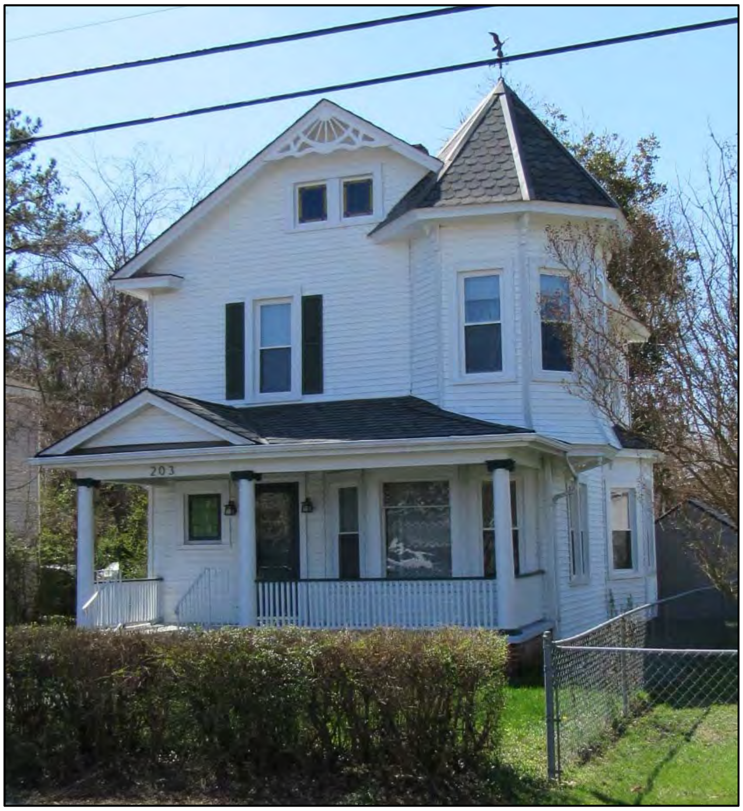

FIGURE3-90: 203 BERKLEY STREET, NORTH ELEVATION

A second period of architectural expansion in Berkleytown occurred between 1930 and 1960. This development was often as infill on Berkley and Henry Streets and then along A and B Streets, with the dwellings mainly being built in the Minimal Traditional or Transitional Ranch styles (Figure 3-91 and Figure 3-92). These resources have not undergone many modifications; most maintain their original massing and many original materials.

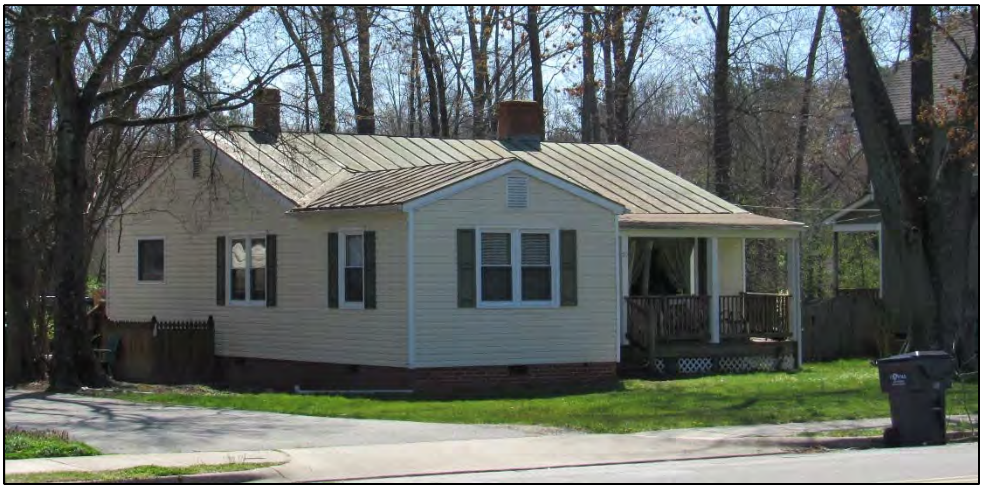

FIGURE 3-91: 513 HENRY STREET, NORTHWEST OBLIQUE

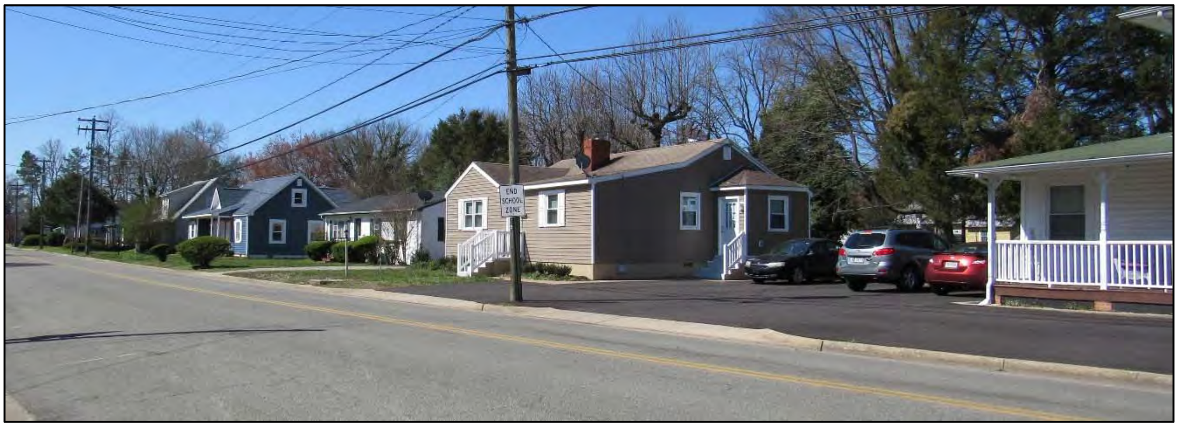

FIGURE 3-92: VIEW ALONG HENRY STREET, LOOKING SOUTH

Some modern infill has made its way into the neighborhood but does not strongly affect the architectural integrity of the district. These buildings are both single-family and multi-family dwellings and are spread throughout the neighborhood (Figure 3-93 and Figure 3-94).

There are three buildings in Berkleytown that were not constructed as dwellings. This includes the Hanover County Public School Board (Formerly John M. Gandy High School) (166-5073-0024), the Dabney Funeral Home (166-5073-0010), and a commercial resource at 612 Henry Street (166-0033). For more information about the Hanover County Public School Board and the Dabney Funeral Home, see pages 3-105 and 3-94 respectively. The resource at 612 Henry Street, constructed in the 1920s, began as a hotel catering to African Americans traveling though Ashland and later served as a meeting place for Improved Benevolent Protective Order of Elks of the World (Figure 3-95) (HaCDB 107:422).

In general, buildings in the district range from one to two stories in height and primarily are built upon continuous foundations. Exterior materials include weatherboard and vinyl siding as well as brick veneer. They are primarily covered in a type of gable or hipped roof with asphalt shingles. Although some fenestration has been replaced or updated, as is common in continuously occupied buildings, many still retain original or in-like windows and doors. These includes two-over-two, wood-frame, double-hung sashes as well as six-over-six, double-hung sashes. Primary elevations typically feature an entry stoop or porch. Secondary resources include such storage sheds, garages, and carports.

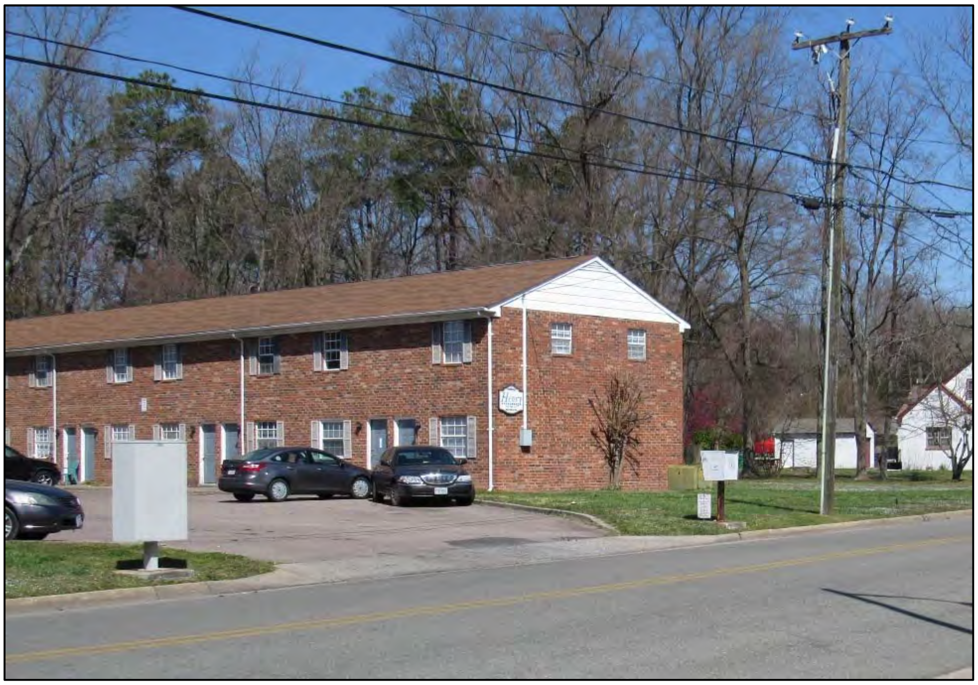

FIGURE 3-93: APARTMENTS AT 700 HENRY STREET, LOOKING NORTHWEST

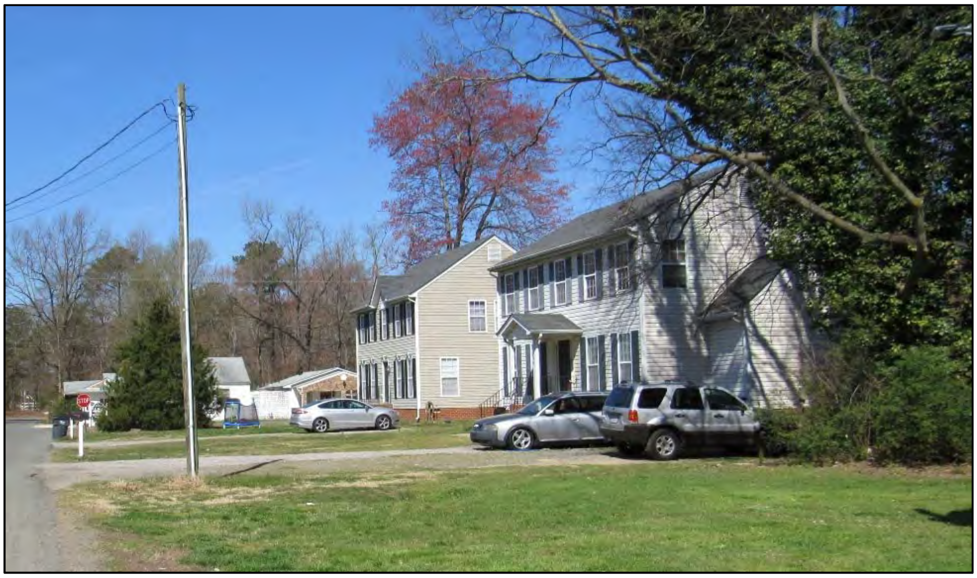

FIGURE 3-94: VIEW OF MODERN INFILL ALONG A STREET, LOOKING WEST

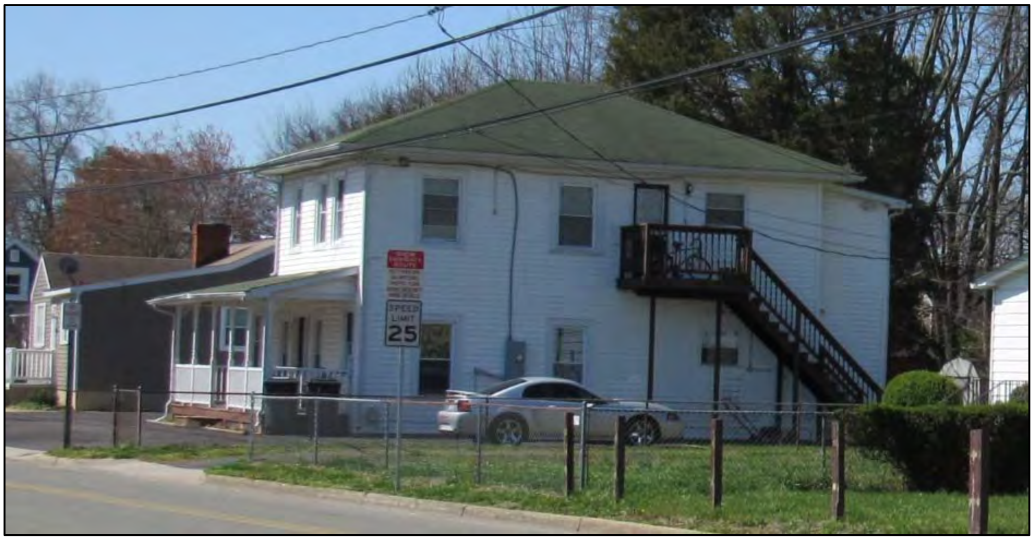

FIGURE3-95: RESOURCE AT 612 HENRY STREET (166-0033), NORTHEAST ELEVATION

3.8.3 NRHP Evaluation

The neighborhood of Berkleytown is a representative example of small-town, twentieth-century, African-American neighborhoods. What was once a segregated residential enclave has become enveloped into the town plan, but the resources maintain their original small vernacular forms (Shalf 1994:124). The buildings within the district were constructed between 1900 and the present. Though there is some modern infill in Berkleytown, it is minimal and the neighborhood still retains much of its historic character, possessing a moderate level of integrity of setting, design, feeling, and association. Some retention of historic materials and general good condition of the individual resources within the district renders a moderate level of integrity of materials and workmanship. This resource retains a high historic integrity of location.

The NPS guidelines for evaluating a district under Criterion A, state that it must be associated with one or more events or trends important in a defined historic context (Shrimpton et al. 1990). Berkleytown is a historically African-American neighborhood that grew as a result of legal segregation in Ashland during the early- to mid-twentieth century. Strategically located on the outskirts of town and technically situated within Hanover County until 1977, this community emerged in the 1910s and 1920s as an acceptable area for African-American residents, as noted by local officials' relocation of the old white school to Berkley Street. At a time when a portion of the population was legally prohibited from living within the downtown core, African-American residents sought habitation on land immediately adjacent to town, thus ironically allowing them to continue to work in the same area where they were barred from living. As such, this "community within a community" reflects important patterns of Community Planning and Development as well as Ethnic Heritage in Hanover County. Therefore, the Berkleytown Historic District is recommended eligible for listing under Criterion A. There is not any known association with any significant person or persons from local, regional, or national history; therefore, the resource is recommended not eligible under Criterion B.

According to the guidelines set by the NPS, for a district to be eligible under Criterion C, it must clearly contain enough distinctive characteristics to be considered a true representative of a particular type, period, or method of construction (Shrimpton et al. 1990). Many of the buildings within the district have undergone alterations such as window and siding replacement, porch replacement or enclosure, and the construction additions to the rear and/or side elevations. There are also better examples of architecturally significant African-American neighborhoods in surrounding areas such as the Barton Heights Historic District (127-0816) in Richmond and the Pocahontas Island Historic District (123-0114) in Petersburg, both of which have been listed in the NRHP. As such, the Berkleytown Historic District is not recommended eligible for listing in the NRHP under Criterion C. As an architectural resource, the Berkleytown Historic District was not evaluated under Criterion D.

In sum, the Berkleytown Historic District is **recommended eligible for listing in the NRHP under Criterion A at the local level for its associations with Community Planning and Development and Ethnic Heritage, but not eligible under Criteria B and C.**

The period of significance for the Berkleytown Historic District extends from the passage of Ashland's segregation law in 1911 to 1969, the year in which the John M. Gandy High School closed after integration with Patrick Henry High School. The proposed NRHP boundaries for the district encompass about 60 acres of land on the east side of the railroad tracks. The northern terminus starts at the intersection of Vaughan Road and Henry Street and encompasses several dwellings and the Hanover County School Board building. The boundary stretches south to the intersection of North Center Street and Berkley Woods Drive. The eastern boundary of the resource encompasses the buildings along Berkley Street until its intersection with North Washington Highway (Figure 3-96).

3.9 DABNEY FUNERAL HOME (166-5073-0010)

The Dabney Funeral Home at 600 B Street is located at the northwest corner of the intersection of A and B Streets, in Ashland in Hanover County, Virginia. The resource, which faces east, is located on a 0.33-acre lot that is covered by a manicured lawn (Figure 3-97). A gravel driveway leads west from B Street to an attached carport on the north elevation of the chapel building. Another gravel drive and parking area leads from B Street and extends west, parallel to A Street, on the south end of the property, to extra parking on the rear (west) of the property. A poured-concrete sidewalk leads from the public sidewalk along B Street to both the main entrance and the entrance to the chapel building. An associated circa-1970 metal carport sits to the west of the primary resource.

3.9.1 Historic Context

The Dabney Funeral Home is a circa-1955, one-story, three-bay, Minimal Traditional-style, single-family dwelling that has continually served as both a residence and family-owned funeral home. Today, it is one of the few traditional African-American-owned businesses in the aforementioned Berkleytown neighborhood—a historically African-American community that emerged following legal segregation efforts in the form of racial covenants (Shalf 1994:124). For a larger history of this community see the section for the Berkleytown Historic District on page 3-82.

In 1927, Thomas and Elsie Henderson purchased a lot just north of what was then the incorporation line of Ashland from James T. and Elizabeth F. Crosby (HaCDB 85:294). The lot was number 13 on the plat that composed part of the original boundaries of Berkleytown (Figure 3-98) (HaCPB 7:147). Thomas Henderson was an African-American man who grew up on a farm outside of Ashland. By 1930, he and his wife were noted as living in Richmond and he was working as a railroad caretaker (U.S. Census 1920; 1930). Archival research indicates that the lot remained vacant during the ownership of Thomas and Elsie Henderson. In 1953, Floyd E. Dabney purchased the parcel from the Hendersons and built the Minimal Traditional-style dwelling that is currently centered on the lot (HaCDB 155:197). The F.E. Dabney Funeral Home was established out of the house in 1955 and over time, various additions, such as the chapel, were added to support the business (Richmond Times-Dispatch 2015).

Floyd Dabney was born in Ashland in 1920 and attended the Hanover Training School, which was the only school in the county for African-American students at the time, located on School Street in Berkleytown. He served in the 761st Tank Battalion under General Patton during World War II and then attended mortuary school in Pennsylvania (Find-a-Grave 2011). He married Henrietta Wiley in 1952, and they started the F.E. Dabney Funeral Home together. To supplement their incomes, Floyd drove a cab in town and Henrietta was a nurse at several area hospitals (Richmond Times-Dispatch 2015). They were active in the community; both were members of the National Association for the Advancement of Colored People (NAACP) and Henrietta ran for local office. After Floyd Dabney passed away in 2006, their son Floyd Dabney Jr. took over the business which he continues to run today (Richmond Times-Dispatch 2015).

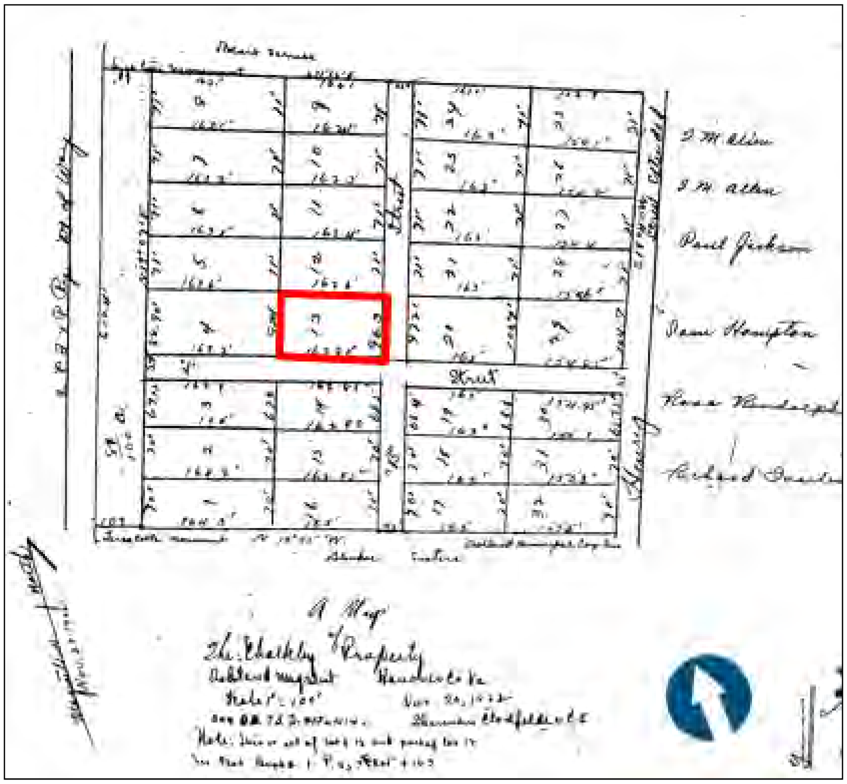

FIGURE 3-98: PLAT MADE BY SHERMAN CLODFELDER, C.E. NOVEMBER 20, 1922 OF BERKLEYTOWN (HACPB 7:147). NOTE LOT 13 OUTLINED IN RED.

African American-owned funeral homes have historically played an important role in the communities they serve. The African-American-owned funeral home business picked up significantly after the Civil War as:

> concerns about how black bodies were laid to rest by white undertakers fueled the desire among African Americans to have their family members buried by black undertakers whom they believed would bury their dead with care and dignity. A desire to meet this community need, while also earning a comfortable, stable living led would-be entrepreneurs to the undertaking business (Micale 2016).

This tradition continued, with funeral directors often serving as prominent members of the community, many going into politics or the clergy and frequently being involved in the local civil-rights movement, such as the Dabneys (Stanley 2016).

Due to economic strain, in part because of the proliferation of national funeral-home chains, many locally owned, African-American funeral homes are currently closing for business. The National Funeral Directors and Morticians Association, which represents African-American funeral directors, has had its membership decrease by 40 percent since 1997 (Feldman 2017). This mirrors the decline in African-American-owned businesses as a whole since 1970 in this area (Feldman 2017). The Dabney Funeral Home continues to support the local community and is the only functioning commercial resource in Berkleytown.

3.9.2 Architectural Description

3.9.2.1 Primary Resource Exterior

The Dabney Funeral Home is a circa-1955, one-story, three-bay, single-family dwelling that is built in the Minimal Traditional style (Figure 3-99 and Figure 3-100). The foundation and structural system, though not visible, are clad in stucco. It is covered by a moderately pitched, side-gabled roof sheathed in asphalt shingles. A parged, brick, central-interior chimney is located on the west slope of the roof. The primary entrance is centered on the southeast elevation and is filled with a single-leaf, half-glazed, wood door that is covered by a storm door (Figure 3-101). The door is flanked by full length, vinyl, louvered shutters. The door is accessed by a set of stairs clad in stone veneer that lead to a one-story, two-bay porch created by the roof overhang. Other fenestration includes two-over-two, double-hung-sash, wood-framed windows with horizontal muntins set on brick sills.

FIGURE 3-99: SITE PLAN FOR THE DABNEY FUNERAL HOME (NOT TO SCALE)

A circa-1955, one-story, rear, porch addition is located off the northwest elevation of the house (Figure 3-102). It is set on a concrete-block foundation and is clad in stucco. The shed roof is sheathed in asphalt shingles. This addition features ribbons of one-over-one, double-hung-sash, metal-framed windows with metal awnings.

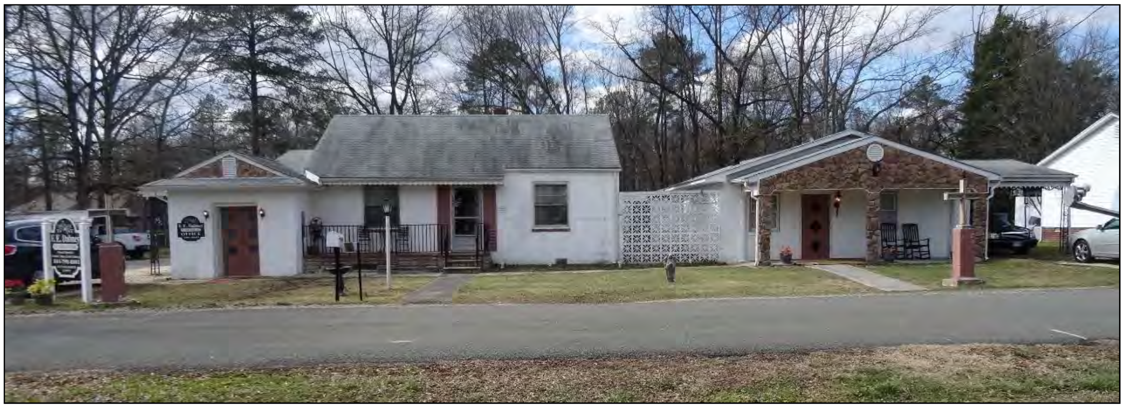

FIGURE 3-100: DABNEY FUNERAL HOME, SOUTHEAST ELEVATION

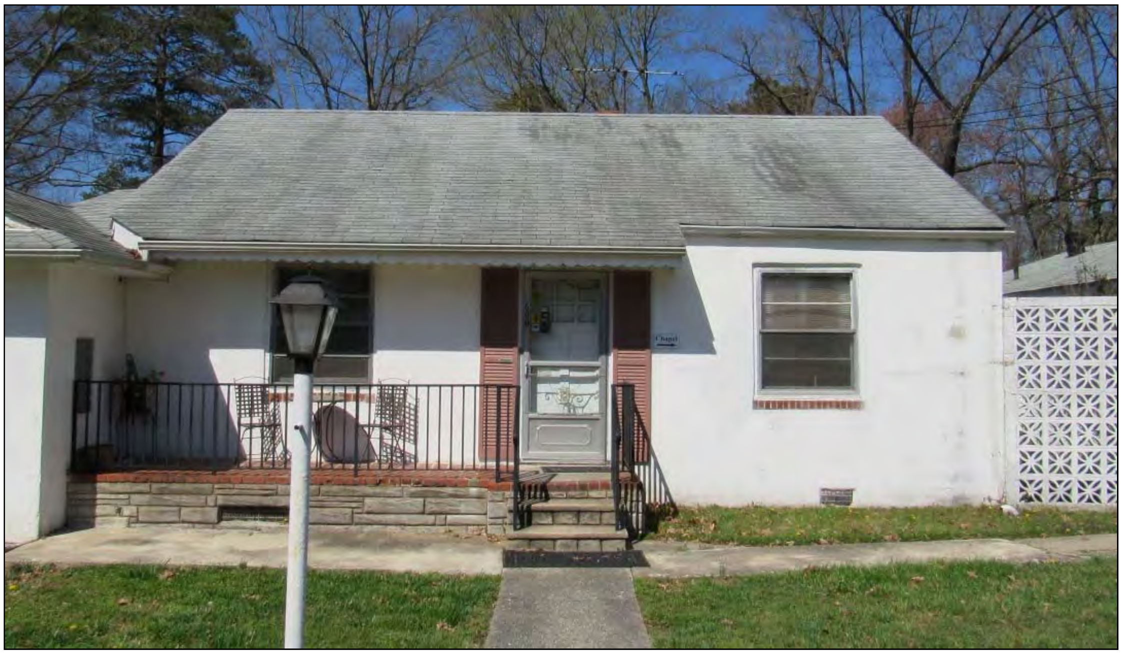

FIGURE 3-101: MAIN BLOCK DETAIL, SOUTHEAST ELEVATION

A circa-1970, one-story, one-bay, office addition extends from the southwest elevation (Figure 3-103). It is clad in stucco and covered by a front-gabled roof sheathed in asphalt shingles with stone veneer in the southeast gable end. The entrance to the office is recessed and centered on the southeast elevation. It is filled with a double-leaf wood door with six-fixed lights. This addition includes multi-light, glass-block windows and two-over-two, double-hung-sash, wood-framed windows with horizontal muntins set on brick sills. A secondary entrance to the office is located on the southwest elevation and is filled with a three-paneled wood door with four fixed lights at the top. It is covered by a one-story, three-bay, front-gabled porch sheathed in asphalt shingles and supported by decorative metal posts.

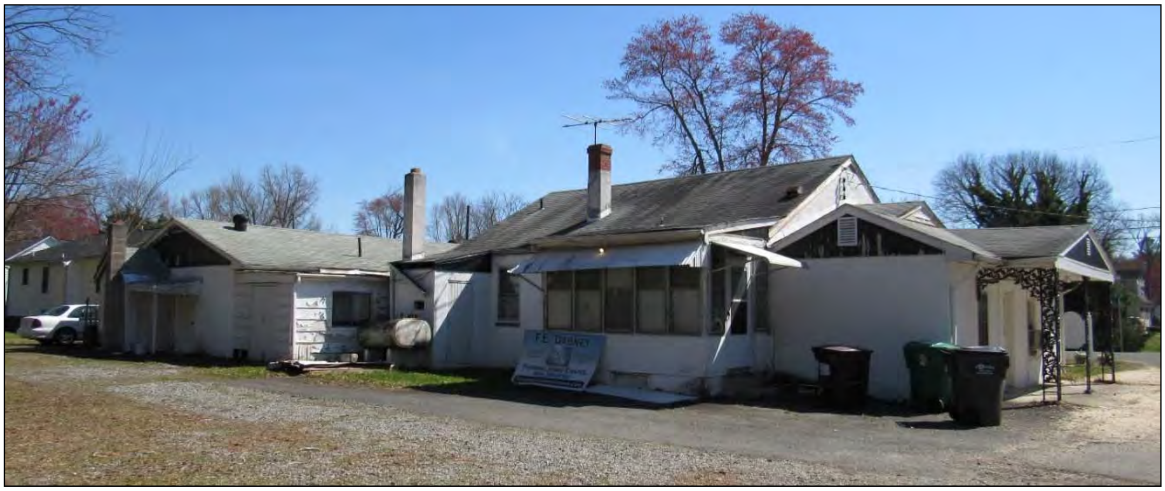

FIGURE 3-102: ADDITION AND REAR DETAILS, WEST OBLIQUE

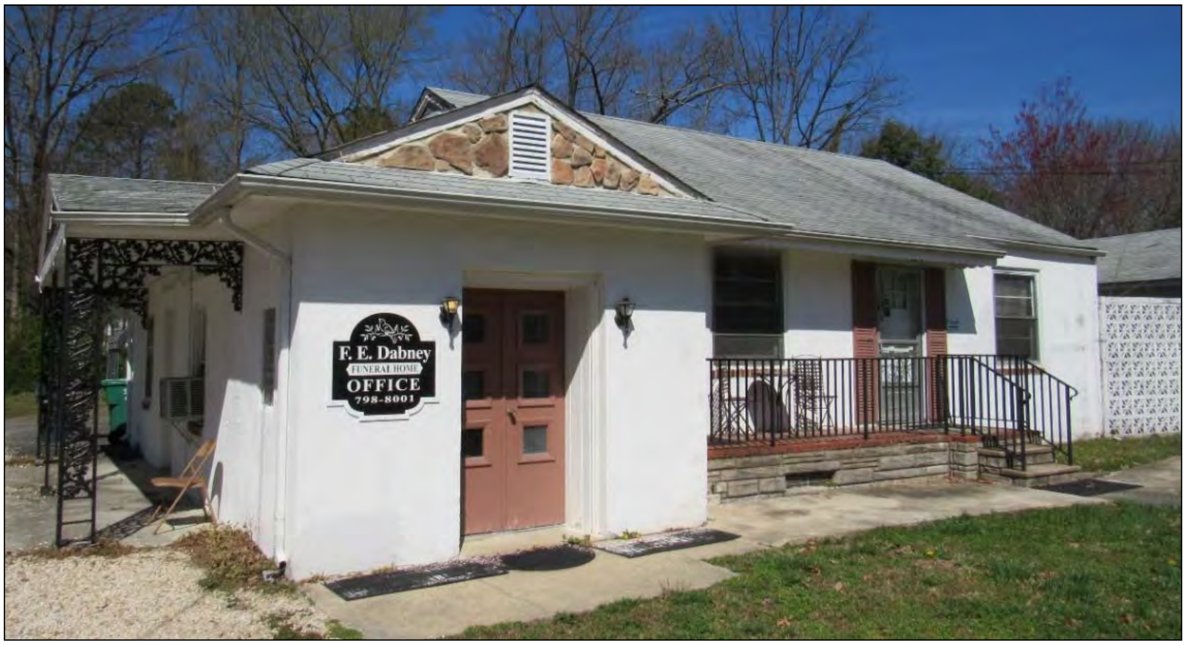

FIGURE 3-103: OFFICE ADDITION, SOUTH OBLIQUE

A circa-1970 chapel addition is located northeast of the dwelling and is connected to the main core by a side-gabled hyphen clad in stucco and a decorative concrete-block screen (Figure 3-104). The one-story, three-bay chapel is clad in stucco and covered by a moderately-pitched, front-gabled roof sheathed in asphalt shingles. A parged, interior-end chimney with a terra-cotta flu is located along the southwest roof slope. The entrance to the chapel is located in the center bay of the primary (southeast) elevation and is filled with a single-leaf wood door with three diamond-shaped lights. The door is covered by a one-story, three-bay, front-gabled porch that is clad in a stone veneer and supported by square posts also clad in stone veneer. A round, louvered vinyl vent is located in the gable end. Other fenestration includes two-over-two, double-hung-sash, wood-framed windows with horizontal muntins.

The chapel features four additions. The first being a small, one-story, one-bay, shed-roof addition clad in vinyl siding that extends from the southwest elevation. It features a double-leaf, flush, wood door and a metal-framed sliding window. A front-gabled addition extends southwest off the first addition and is clad in stucco with vertical-wood boards in the gable end. A single-leaf flush metal door is located on the southwest elevation. The third addition extends from the northwest elevation of the chapel. It is clad in stucco and covered by a front-gabled roof sheathed in asphalt shingles. A concrete-block, exterior end chimney is located on the northwest elevation and a metal awning supported by a metal post extends from the southwest elevation. The final addition to the chapel is a one-story, open-bay, carport that is situated on the northeast elevation. It is covered by a gabled roof sheathed in asphalt shingles and supported by wrought metal posts.

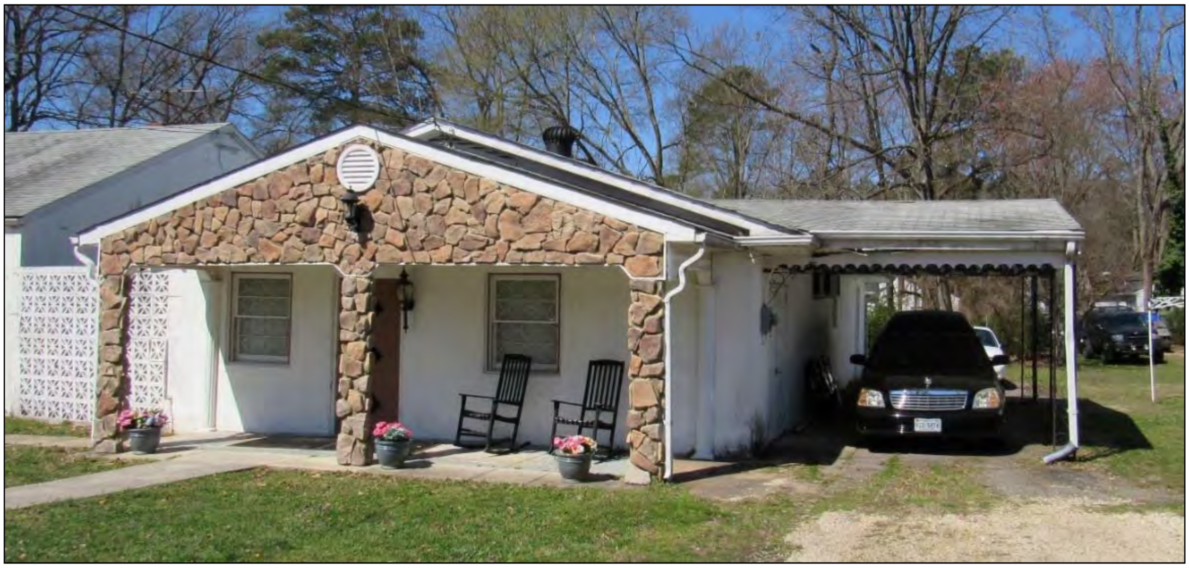

FIGURE 3-104: CHAPEL ADDITION, SOUTHEAST ELEVATION

3.9.2.2 Primary Resource Interior

Interior access to this resource was not granted during the current survey.

3.9.2.3 Secondary Resources

A one-story, open-bay, circa-1970 carport sits to the west of the primary resource (Figure 3-105). The front-gabled roof sheathed in corrugated metal is supported by metal poles.

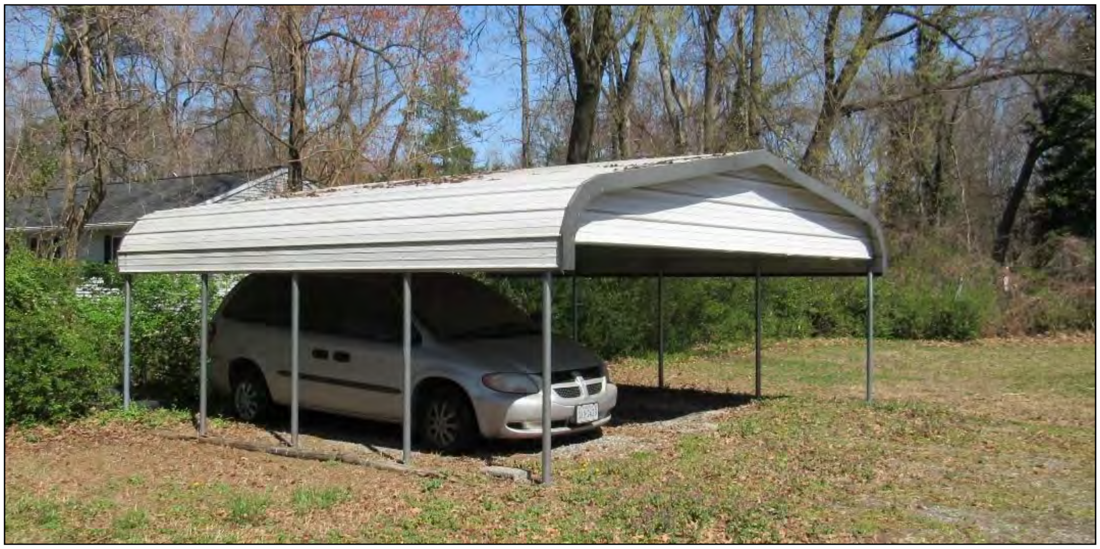

FIGURE 3-105: CARPORT, LOOKING NORTH

3.9.3 NRHP Evaluation

The Dabney Funeral Home is a residence and commercial building constructed in the Minimal Traditional style that is one of few remaining African-American-owned businesses in the Berkleytown neighborhood and Ashland as a whole. The resource retains a high level of historic integrity of location, setting, feeling, and association. Though the resource has had many additions over the years, its design builds upon that of a vernacular single-family dwelling and has grown over time to serve the various needs of a small family-owned, funeral home that is subject to certain laws and regulations. In this context, the Dabney Funeral Home is believed to retain a moderate level of integrity of design, materials, and workmanship.

This resource continues to operate as a funeral home, a use it has performed since it was built in 1955. African-American-owned funeral homes have historically played an important role in the communities they serve and are currently experiencing a period of decline throughout the United States. There are also no other funeral homes previously recorded with the DHR that were determined potentially eligible or eligible for the NRHP. This resource is therefore not only directly representative of Berkleytown as an African-American enclave but it is a unique example of a once-prolific business type in this area and, indeed, the United States. For these reasons, it is recommended that the resource is eligible for listing in the NRHP under Criterion A at the local level for its association with African American-led trends in commerce in the Town of Ashland.

For a historic resource to be considered eligible under Criterion B, it must be associated with a person who is "individually significant within a historic context" and who has "gained importance within his or her profession or group" (Shrimpton et al. 1990). Though the Dabney family provided an important service to their community, the family does not appear to have attained significance in their own right. As such, the resource is recommended not eligible for the NPHP under Criterion B.

The Dabney Funeral Home is a circa-1955, one-story, three-bay, Minimal Traditional, single-family dwelling that has continually served as a both a residence and family-owned funeral home. Its design continues to reflect its original architectural character and continued use as a vernacular building, but it is not an outstanding example of its style or property type. Therefore, the DC2RVA team recommends the property not eligible for the NPHP under Criterion C. As an architectural resource, it was not evaluated under Criterion D.

Additionally, the Dabney Funeral Home is located within the African-American community known as Berkleytown and dates from its period of significance. Therefore, this resource is recommended as a contributing element of the Berkleytown Historic District (166-5073). In sum, the Dabney Funeral Home is **recommended eligible for listing in the NRHP under Criterion A at the local level for its association with African-American-led trends in commerce in the Ashland community and is also recommended as a contributing resource of the Berkleytown Historic District (166-5073)**.

Because it continues to be associated with African-American trends in commerce and functions as a funeral home, the NPS 50-year-rule for defining periods of significance for resources was applied, which states that "where activities begun historically continued to have importance and no more specific date can be defined to end the historic period" (NPS 1997). As such, the period of significance spans from 1955 to 1968. The proposed NRHP boundaries for Dabney Funeral Home conform to the existing tax parcel (Parcel ID 7870-84-4467) (Figure 3-106).

3.10 HANOVER COUNTY PUBLIC SCHOOL BOARD (166-5073-0024)

The Hanover County Public School Board [HCPSB] building is located on the northeast side of Berkley Road, east of the railroad tracks and north of the heart of Ashland, in Hanover County. It is also located within the boundaries of the Berkleytown Historic District (166-5073) (see page 3-82). The school board building, formerly the John M. Gandy High School, is situated on the southwest portion of a 1.29-acre lot shared, in part, with the current John M. Gandy Elementary School to the north and east (Figure 3-107). Parking is available to the north, south and west of the building bounded by Henry Street on the west and Berkley Street to the south. There is little ornamental landscaping, though the lawn is manicured. No secondary resources were observed with exclusive association with the HCPSB. The property has several access points; paved driveways leading to parking lots located on the north, south, and west of the building off of Henry and Berkley Streets.

3.10.1 Historic Context

The current building that houses the HCPSB was constructed in 1948 as the new Hanover County Training School, replacing an earlier complex at the same location, just northeast of Ashland. The Hanover County Training (or Technical) School emerged in the 1930s, augmenting a circa-1915 frame school for African Americans that was moved to Berkley Street after a new brick building for the area's white population was erected (Shalf 1994:146). Training schools focused on preparing students for service-based work, such as domestic work for young women and physical work for young men. According to Sanborn insurance maps in 1929, the Hanover County Training School consisted of one high school building heated by a stove. By 1949, a grammar school, trade school, and one small additional building were added to the compound (Figure 3-108) (Sanborn Map Company 1929, 1949). In the 1930s, the training school was reported to be the only school for African Americans in Hanover County (Figure 3-109).

"Public schools in Virginia were segregated from the outset, apparently without much thought or debate, on the widely-held assumption that such an arrangement would reduce conflict" (Virginia Museum of History and Culture [VMHC] n.d.a). The *Plessy v. Ferguson* Supreme Court decision of 1896 institutionalized this sentiment, ruling that racial segregation of public spaces was legal as long as the spaces were equal. "Many whites did not want blacks to become educated, fearing they would challenge white supremacy and not be content with jobs working in the fields or in domestic service. Black schools therefore received far less financial support than did white schools" (VMHC n.d.b).

Early in the twentieth century, Virginia Public School boards began providing school buses for white students, but not for African American students, increasing the disparity in education access between populations. In 1934, bus service for African American students to Hanover County Training School began with the support of the Chickahominy Baptist Association in Hanover County (DHR 2016).

In the early 1950s, segregation laws were being challenged in court by the NAACP, and school districts in Virginia were among those states cited in *Brown v. Board of Education* (1954) which determined that separate facilities are not, in fact, equal. Plans for a new segregated high school in Hanover County were developed shortly before the Brown v. Board decision.

\\DTS2\Main Job\14-015 RAPS\GIS\2018Work\14_015_AH_Phil.mxd | Last Updated: 04.24.2018

By the late 1940s, the Hanover County Training School facilities were no longer seen as adequate, and plans for a new school were drawn. The old school buildings lacked plumbing and electricity, and were heated by wood stoves; the new school design, created in 1948 by Richmond architect Edward F. Sinnott, was modern and well-appointed. Opened in 1950 as the John M. Gandy High School, this was the first modern public high school for black students in Hanover County (Figure 3-110) (The Ashland Museum n.d.c).

Edward Francis Sinnott, Sr. (1890–1975) began his career in partnership with Luther P. Hartsook as Hartsook and Sinnott, designing Richmond residences, apartments, banks, and churches from 1924 to 1929. After their partnership dissolved in 1929, Sinnott practiced under his own name, building schools and institutions, supplemented by restoring Richmond residences. One of the most significant examples of his work during this period is the Art Deco-styled Franklin Federal Savings and Loan Company Building (1941) (127-5306) in Richmond. Sinnott partnered with his son, Edward Francis Sinnott, Jr., in 1956, though little is known about their production during this period (DHR 2005). Sinnott designed another school for members of the Mattaponi tribe, the Sharon Indian School (050-5005) in King William County, in 1952 in a similar style, which is now listed in the NRHP under Criterion A for its association with education and the Native American population as well as Criterion D for its potential to yield information specific to the aboriginal history or prehistory (V-CRIS 2018). Like the HCPSB building, it bears resemblance to the International style, popular among institutional architects of the time (Figure 3-111 through Figure 3-113).

A memoir penned by poet and scholar Anand Prahlad (b. 1954) highlights the importance of the John M. Gandy High School to the African-American community in Ashland:

> At Gandy everybody, all day, every day, was black. Our teachers were educated, but we still recognized them as us. However strange sitting still and saying nothing might have been, someone like us was there to soften the strangeness of it all. They talked to us as one of us, even when they spoke ‘proper’ [Prahlad 2017:63].

The school was integrated with Patrick Henry High School in 1969, but it is unclear how the John M. Gandy High School was used after this time (DHR 2016). In recent decades, it was repurposed as the Hanover County School Board office facility (The Ashland Museum n.d.c). The Hanover County School Board oversees 26 schools within the county, with approximately 18,000 students and 1,300 teachers (National Center for Education Statistics 2018).

3.10.2 Architectural Description

3.10.2.1 Primary Resource Exterior

The primary building located at 200 Berkley Street is a two-story, eight-bay, high school constructed between 1948 and 1950 in the International style (Figure 3-114). The continuous foundation and structural system are clad in common-bonded brick veneer (Figure 3-115). A brick belt course, articulated by concrete bands, separates the first and second story. The building is covered by a flat roof with a parapet wall sheathed in standing-seam metal. A solid brick tower extends above the roofline from the center of what was historically the primary (east) elevation, adjacent to the centered recessed entry bay. The entry is sheltered by a one-story, one-bay, flat-roofed porch with one thin metal support post. The doorway has been replaced with T1-11 siding over the opening. Fenestration at the façade has been substantially modified from what appears to have been ribbon windows with large bays reduced to a single, metal-framed, fixed light or multiple, metal-framed, fixed lights. Some of the reduced window openings have been filled with T1-11 siding and others with running-bonded brick.

FIGURE 3-114: SITE PLAN OF THE HANOVER COUNTY SCHOOL BOARD (GOOGLE 2018) (NOT TO SCALE)

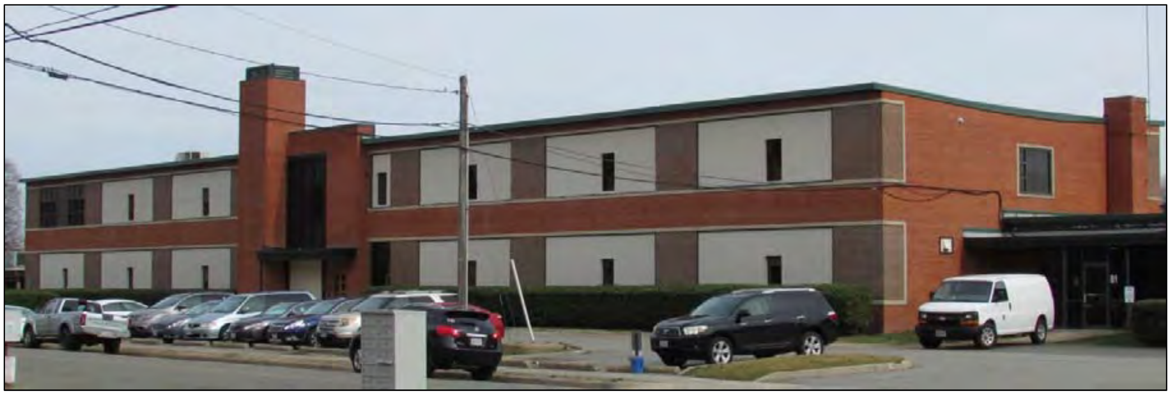

FIGURE 3-115: SOUTHWEST OBLIQUE, VIEW OF FORMER PRIMARY ENTRANCE

A two-story gymnasium is located on the northeast side of the building (Figure 3-116). It is clad in running-bonded brick veneer that matches the primary resource, has a continuous masonry foundation, and flat roof. At one point, it had large square windows on the south and north elevations that are now filled in by brick.

An addition was made to the HCPSB complex after 1950 (Figure 3-116). It functions as the current primary entrance and reception area for the Hanover County School Board. This one-story, multi-bay addition is supported by a continuous foundation and clad in brick veneer and concrete parging. The primary entry door is concealed by a protruding, flat-roofed, central entry bay, and is accessed by a brick and concrete ramp/stair combination. Other fenestration includes a fixed, metal, multi-light window.

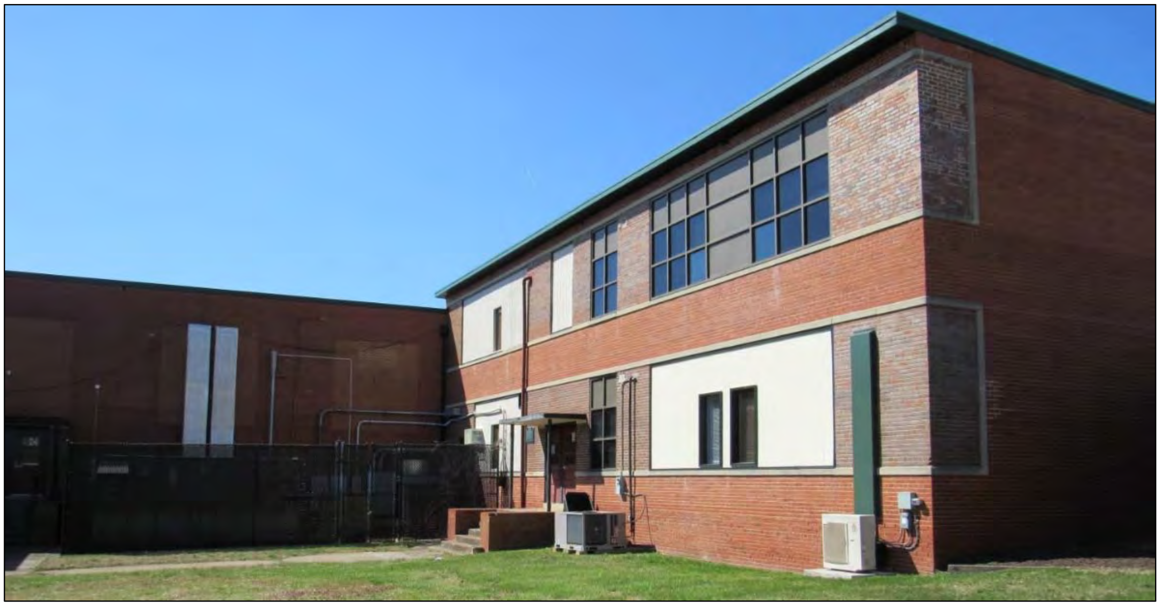

FIGURE 3-116: NORTHEAST OBLIQUE

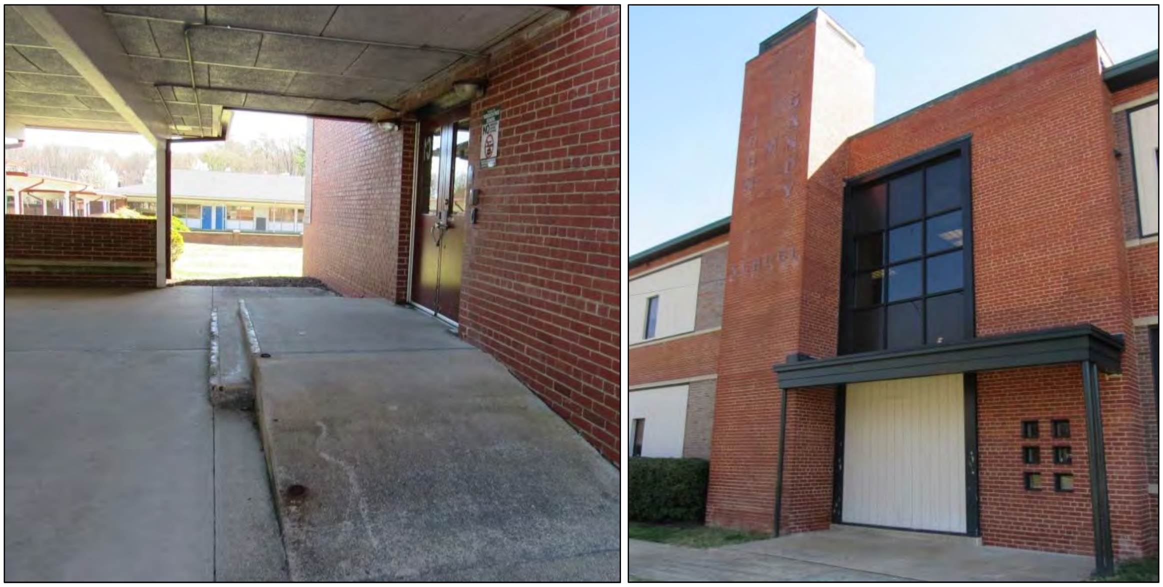

FIGURE 3-117: ELEMENTARY SCHOOL CONNECTION (LEFT) AND FORMER ENTRY BAY (RIGHT)

3.10.2.2 Primary Resource Interior

Interior access was not granted by the current property owner during this effort. However, the building is presently used as office space by the HCPSB, and the interior has likely been remodeled to accommodate this change in use.

3.10.2.3 Secondary Resources

In the last three decades of the twentieth century, additional buildings were added to parcels owned by the Hanover County School Board adjacent to the John M. Gandy High School to form the John M. Gandy Elementary School. These additional related structures form the educational complex attached to the HCSB building on the northwest side by a covered, paved walkway. These multi-bay buildings are between one and two stories, have flat or low-pitched side-gable roofs, and are clad in brick veneer. Other resources on the property include outdoor recreation equipment, a track, dumpsters and exterior HVAC facilities, pergola, street lights, paved parking areas, and associated pedestrian walkways.

3.10.3 NRHP Evaluation

The HCPSB is a two-story brick building constructed between 1948 and 1950 in the International style. Although it was a thriving African-American high school prior to its integration with another facility in 1969, the building has not been used in this capacity for almost 50 years. The resource retains high historic integrity of location and setting, and moderate to low integrity of feeling and association. Modifications, to this resource, including the infill of windows on the primary elevation with incompatible materials, change of interior space to accommodate school board offices, and the construction and expansion of the John M. Gandy Elementary School adjacent and connecting to the building have substantially diminished its historic integrity of design, materials, and workmanship.

While the HCPSB was the first African-American High School in Hanover County, there are six other schools in Hanover County that are recorded with the DHR for their connection to African American history: The Virginia Industrial Home School for Colored Girls (042-0126-0002) associated with the Barret Juvenile Correctional Center, Mount Hewlett School (042-0460), Ebenezer School (042-0439), School at Gum Tree (042-0395), Linney Corners School (042-0266) and Elmont Elementary School (042-0116). The Mount Hewlett School and Elmont Elementary Schools are examples of primary-school educational facilities and faced different challenges during this resource's period of significance. The Ebenezer School is a rare surviving example of a church-sponsored school for African American children, separate from public schools. The Virginia Industrial Home School for Colored Girls (042-0126-0002) remains as a more intact African American School, and was constructed, in part, in 1951 in a style similar to the Hanover County School Board building by another Richmond Architect working in the international style, Merrill C. Lee. Archival research did not yield any names of significant individuals involved with the high school or other important people of note. Therefore, the resource is recommended not eligible under Criteria A and B.

Although it was the first high school for African Americans in Hanover County, the complex has been expanded and modified over time, losing much of its historic integrity, and thus its ability to convey the associations for which it is historically significant. Most of the windows have been infilled, and character-defining features of the International Style have been removed. More intact examples of mid-century educational buildings are located throughout the region. Therefore, the HCPSB building is recommended not eligible for individual listing under Criterion C. As an architectural resource, it was not evaluated under Criterion D.

As the sole public and educational institution within the Berkleytown Historic District, however, the HCPSB building contributes to the larger sense of the African-American experience in the Town of Ashland and Hanover County, at large. Built as a segregated school within the period of significance for Berkleytown, the DC2RVA team recommends that is a contributing resource to the Berkleytown Historic District (166-5073).

In sum, the HCPSB Board building **is recommended not eligible under Criteria A–C, but is recommended as a contributing resource to the Berkleytown Historic District (166-5073)**.

3.11 CHARLES GWATHMEY HOUSE (042-0113)

The Charles Gwathmey House (formally known as the Judge Gwathmey House) is located on the south side of Gwathmey Church Road, immediately west of the railroad tracks and Holly Oaks Lane within the rural community of Gwathmey, outside of Ashland in Hanover County, Virginia (Figure 3-118). The building, set slightly back from the roadway, is located in the center of a lot measuring approximately 2.5 acres and is primarily surrounded by a manicured lawn heavily dotted with deciduous trees. A concentration of trees is situated in the southwest and south portions of the property, a majority of which is lined by a combination of metal picket and post-and-rail fencing. The house is partially lined with shrubbery. The property is accessed by a u-shaped, gravel driveway that extends from Gwathmey Road towards the north elevation and an additional gravel driveway extends west from Holly Oaks Lane. Associated with the dwelling are a machine shed and a storage building connected to an outbuilding.

3.11.1 Historic Context

Charles B. Gwathmey (1830–1894) purchased 449 7/8 acres, then known as "Little Page" and located about a quarter mile south of the limits of Ashland, for $5,700 at auction in 1886 (HaCDB 20:150). This land contained the entire area of what is today considered the community of Gwathmey and was noted as "lying on both sides of the Richmond, Fredericksburg & Potomac Rail Road, and on both sides of Stoney Run Creek" (HaCDB 20:150).

Charles Gwathmey was born in King and Queen County and had attended the University of Virginia before serving in the 5th Virginia Calvary during the Civil War (Find-a-Grave 2003). He married Caroline Binford (1836–1921) around 1855, and they farmed for a living in Henrico County before purchasing the land in what is now Gwathmey in 1886. They moved to the property with their daughter, Sallie, and her husband and daughter (US Census 1880).

It is likely that around this time, Charles Gwathmey built the large Queen Anne-style dwelling located on the site. The Queen Anne style was prevalent throughout the United States at the end of the nineteenth century, especially near railroads, as the access to easy transportation made pre-cut architectural details conveniently available through much of the nation (McAlester 2013: 268).

Credited with starting the small community of Gwathmey (named in his honor), he slowly sold off most of his land for the construction of other residences as well as the Hanover Female Institute (no longer extant) (DHR n.d.). Soon thereafter, the railroad built a small depot (also no longer extant) for commuters from Gwathmey to Richmond (DHR n.d.). Charles Gwathmey became a merchant around this time, and it is possible he would have used this depot to commute to Richmond. In 1892, once the area was considered populated enough to support a congregation, Charles Gwathmey donated the land for the Gwathmey Baptist Church (042-0106) and was named one of its first members and trustees (Grizzard 1941).

Upon his death in 1894, Charles Gwathmey left the land to his wife, Caroline Gwathmey, and daughter, Sallie G. Holladay, who then passed the property to Caroline Holladay (Sallie's daughter) following their deaths in 1921 and 1929, respectively (HaCDB 176:118; Hollywood Cemetery 2017; U.S. Census 1880). Caroline Holladay did not marry and held the property, then 196.54 acres, until her passing in 1956 when Viola Saunders and the Saving Bank and Trust Company were appointed executors of her estate (Figure 3-119) (HaCDB 176:118).

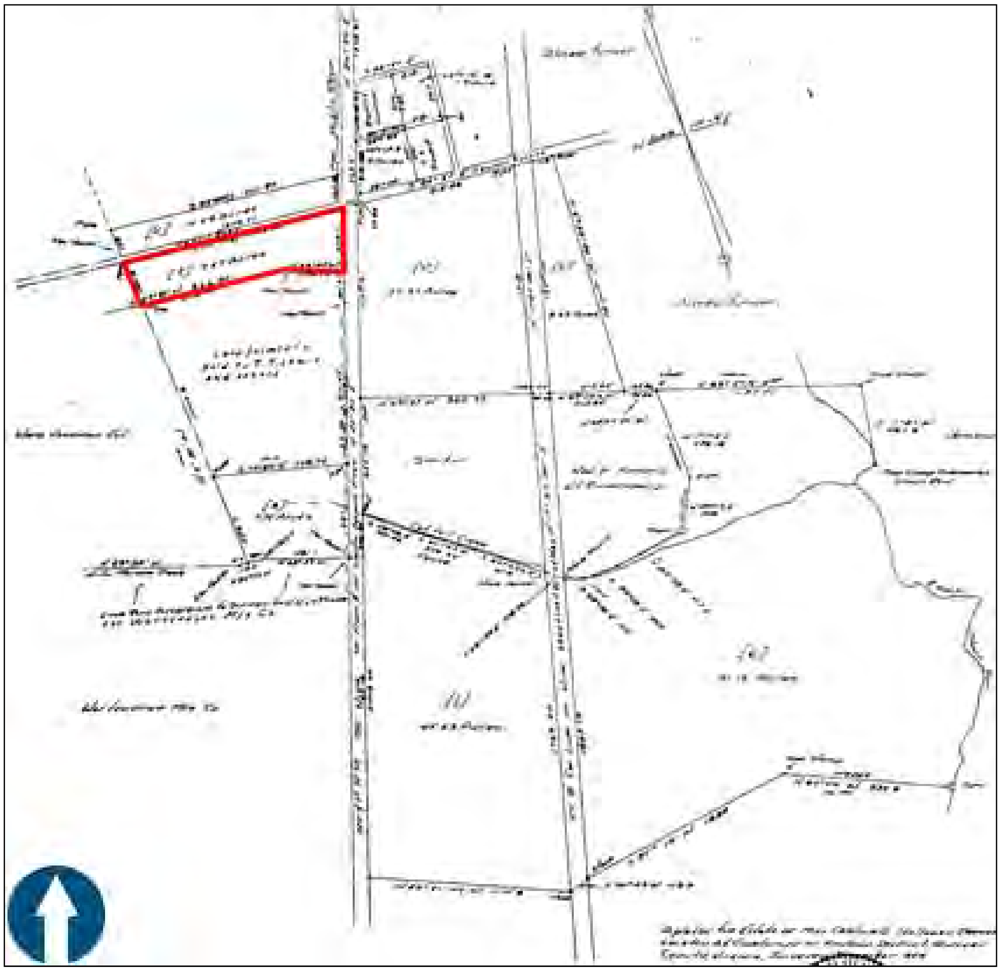

FIGURE 3-119: "A PLAT OF THE ESTATE OF MISS CAROLINE G. HOLLADAY… SURVEYED DECEMBER 1956" (HACDB 176:118). NOTE THE 7.57-ACRE HOUSE LOT IN RED. (NOT TO SCALE)

All of that estate, including the 7.57-acre lot with the Gwathmey residence, was sold to Bernard Westhoff, I. Shelton Harris, and Fritz and Frank Holzgrefe in January 1957, who used the property's timber before selling the residence lot five months later to Phifer A. and Marie W. Deal (HaCDB 176:118). They also decreased the lot size, including "the eastern 2.532 acres of a 7.57-acre parcel. [The other] 5.038 acres having been sold" (HaCDB 178:596). Phifer Deal was a carpenter and did a lot of maintenance and restoration work on the house (Figure 3-120) (U.S. City Directories 1956). The Deals held the property for almost 40 years until Marie W. Deal, then widowed, sold the land in 1996. The property went through three owners in quick succession and is currently held by Emmett L. and Jeanette B. Jones (HaCDB 3156:1523).

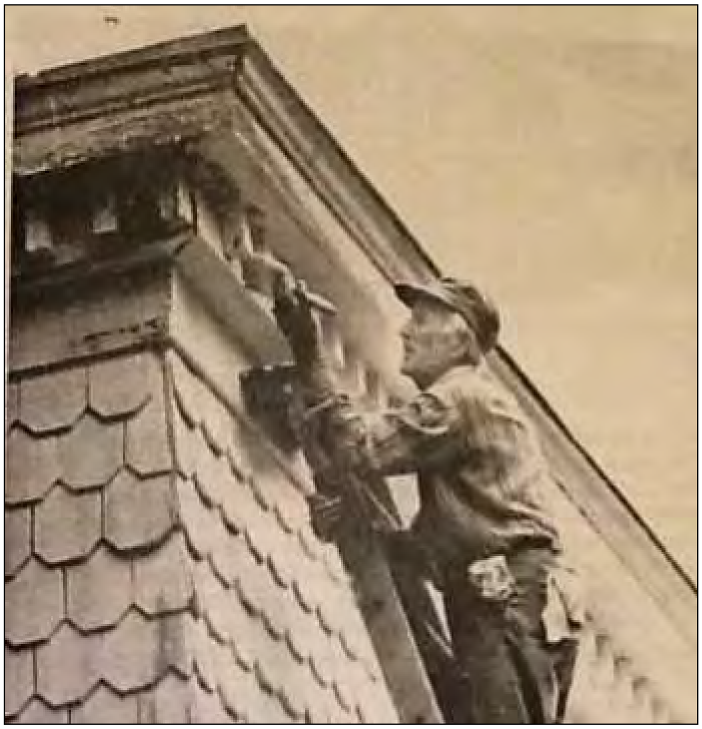

FIGURE 3-120: PHOTO OF PHIFER DEAL PAINTING DENTILS ON CHARLES GWATHMEY HOUSE (ANCESTRY.COM 2012)

3.11.2 Architectural Description

3.11.2.1 Primary Resource Exterior

The resource known as the Charles Gwathmey House at 11247 Gwathmey Church Road is a two-and-a-half-story, four-bay, single-family dwelling constructed circa 1886 in the high Queen Anne style in a cross plan with a tower concentrated in the southeast corner (Figure 3-121). The house sits on a continuous, uncoursed, cut-stone foundation that supports a frame structural system (Figure 3-122). The exterior is clad in weatherboard siding with corner boards in the first story and portions of the second story, while the remainder of the second story is covered in scalloped wood shingles. The building is covered by a moderately pitched, complex, cross-hipped roof with a clipped gabled centered on the primary (east) elevation while the tower is covered by a faceted dome roof (Figure 3-123). The clipped gable is embellished by flared eaves with ornamental wood brackets and diagonal and vertical wood siding. The remainder of the roof is clad in standing-seam metal, and the close eaves feature a denticulated wood cornice. Two brick chimneys laid in an all-stretcher bond pierce the roof in the north and south half of the buildings; they both appear to have once been interior-end chimneys but are now enclosed by additions. The northern chimney features a pressed copper cap.

FIGURE 3-121: SITE PLAN OF THE CHARLES GWATHMEY HOUSE (042-0113) (NOT TO SCALE)

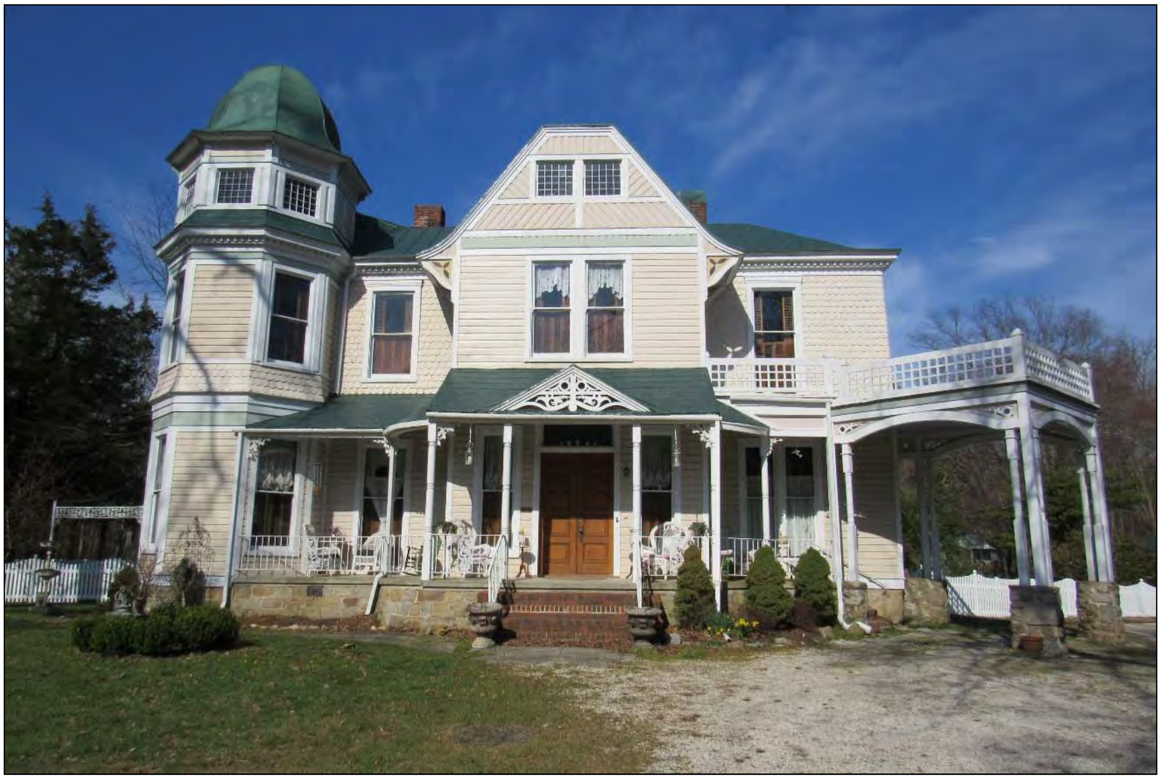

FIGURE 3-122: EAST ELEVATION OF THE CHARLES GWATHMEY HOUSE

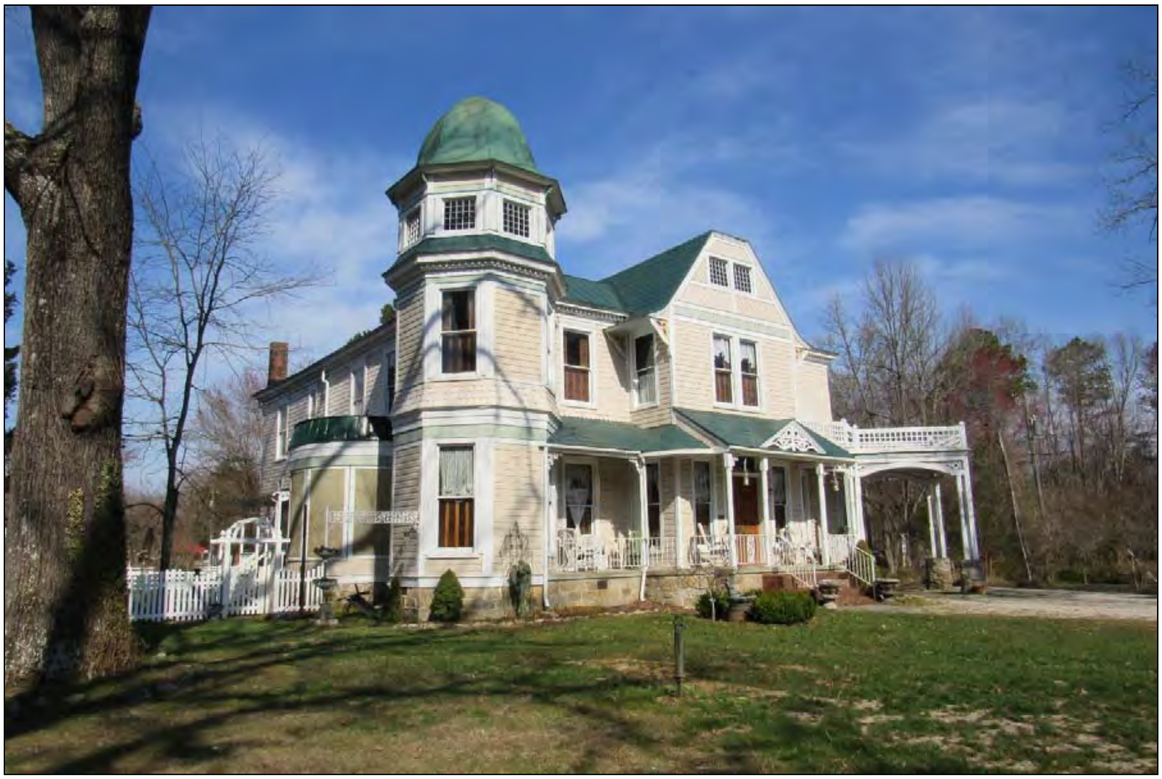

FIGURE 3-123: SOUTHEAST OBLIQUE OF THE CHARLES GWATHMEY HOUSE

Centered on the primary elevation is a double-leaf, five-panel, wood door topped by a fixed, wood-framed transom (Figure 3-124). Other fenestration includes single and paired, one-over-one, wood-frame, double-hung-sash windows and multi-light, wood-frame, fixed windows in the upper half story. All windows feature a simple wood surround. A one-story, shed-roof porch with a central gabled peak sheathed in pressed-metal shingles is located on east elevation sheltering the primary entrance. Decorative features of this porch include wood spindlework and turned wood posts connected by a mid-twentieth-century decorative metal railing and ornamented by mid-twentieth-century decorative metal brackets. The continuous, coursed, cut-stone foundation of the porch is topped by a poured-concrete cap that appears to be a replacement. A set of four brick steps provide access to the main entrance. At the northeast corner of the building, the porch was more recently extended to include a one-story, flat-roof carport that is supported by both square and turned wood posts set on stone-veneered piers. The flat roof is topped with a wood lattice railing with finial-topped posts and features arched openings on three sides, two of which allow for automobiles to pass below.

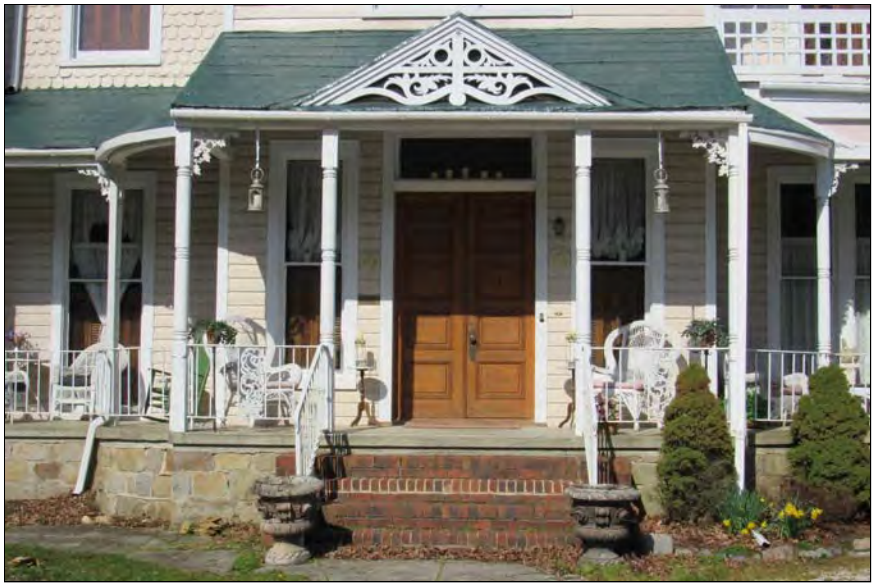

FIGURE 3-124: PRIMARY ENTRY DETAIL, EAST ELEVATION

A circa-1920, two-story, hipped addition clad in the same materials and style as the core extends from the north half of the west elevation (Figure 3-125) (USGS 1925). Protruding from the west elevation of this addition is a one-story shed-roof addition from the last building period at the rear elevation and may have been a recently enclosed porch. It is set on brick piers and has a frame structural system clad in wood siding. This addition features a set of French doors, a singular, fixed, octagonal window, and paired, vinyl, double-hung-sash windows topped by a fixed arched light.

A one-story, semi-circular room, perhaps a sun room, projects from the center of the south elevation. Its uncoursed, mortared, stone foundation suggests that it dates from around the early-twentieth century. This room appears to be topped by a flat roof shielded by a semi-circular parapet wall clad standing-seam metal and is lined with a series of window openings that are currently filled with corrugated plastic panels. These openings are framed by simple wood trim with small sections of shiplap siding visible between them.

A circa-1965, two-story, hipped addition clad in weatherboard extends from the south half of the west elevation which features an exterior-end, brick chimney near the southwest corner (USGS 1969). At the south elevation, a secondary entrance filled by a single-leaf door with storm door is topped by a wood-frame transom accessed by a one-story porch covered by a shed roof and supported by squared wood posts. At the west end of this addition is another one-story, wood-framed, screened porch set on a brick pier foundation with lattice infill and accessed by a set of brick steps. Fenestration in this section of the house includes one-over-one, double-hung, wood-framed windows of various sizes, one six-over-six, wood-framed, double-hung window, and several fixed, wood-framed, square lights. A two-story, lean-to addition lines the north elevation of the southwest hipped addition and is clad in the same materials as the core. A second-floor balcony marks the southwest corner of this addition and is accessed by a single-leaf, wood door with a metal storm.

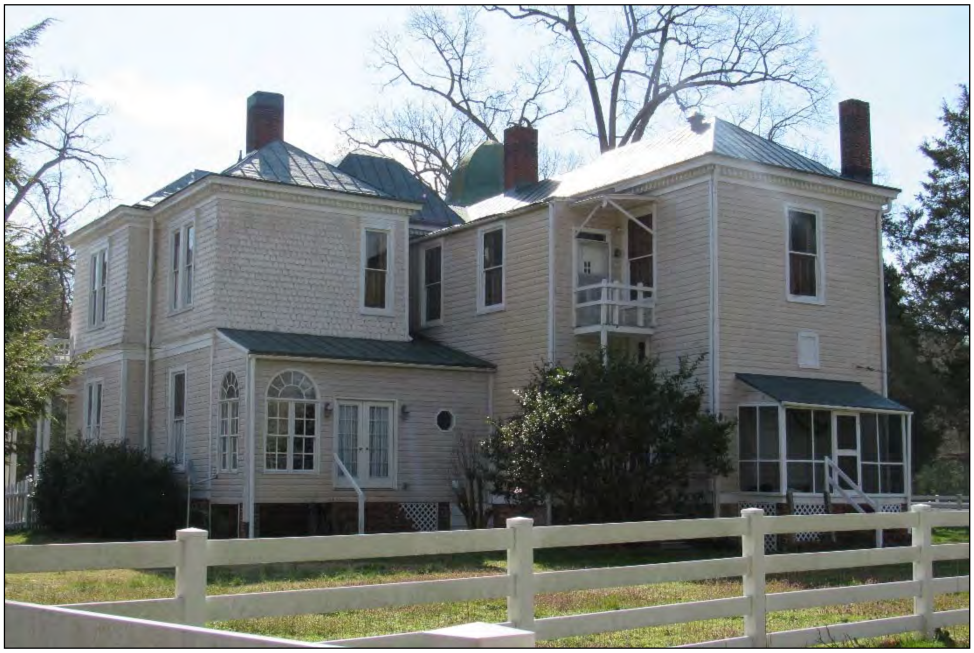

FIGURE 3-125: NORTHWEST OBLIQUE OF THE CHARLES GWATHMEY HOUSE. NOTE THE LARGE REAR ADDITIONS.

3.11.2.2 Primary Resource Interior

Interior access to the resource was not granted during the current survey.

3.11.2.3 Secondary Resources

Situated to the southwest of the dwelling is a storage shed constructed around 1945 (Figure 3-126). The concrete-block building with one brick wall (south) is covered with a salt-box roof sheathed in corrugated metal with an engaged porch along the east elevation where the roof is supported by squared wood posts. T1-11 siding is visible in the west elevation. Piercing the roof in the center of the building is a hipped-roof, metal-louvered vent. A board-and-batten, Dutch-style door and six-over-six, wood-frame, double-hung sash windows are in the east elevation. An additional entrance on the north elevation is filled with a multi-light, wood, single-leaf door. Immediately to the southeast corner of the storage shed is a circa-1920, one-story, one-bay outbuilding constructed of running-bond brick. The side-gabled roof is sheathed in pressed metal with residue of a possible vent piercing the center. A single-leaf, board-and-batten door is centered on the east elevation and features a wood surround. The storage shed is located immediately west of a small, below-ground, round pool engulfed by brick pavers that was covered at the time of survey.

A circa-1960, one-story, two-bay garage is located south of the dwelling (Figure 3-127). The frame building is clad in vertical wood boards at the interior and corrugated metal at the exterior. The shed roof is sheathed in corrugated metal and features a pentice supported by wood brackets along the east elevation. The entirety of the east elevation is left open.

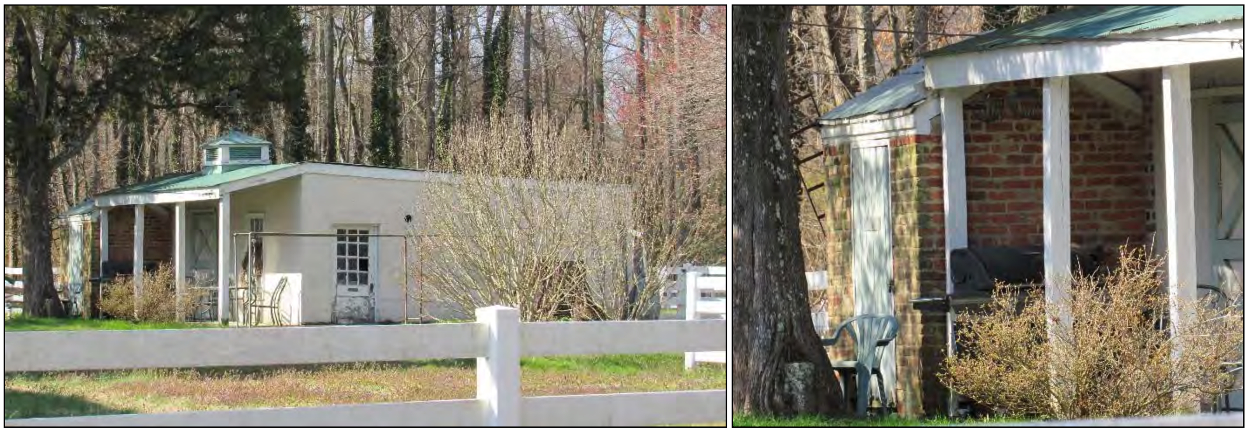

FIGURE 3-126: NORTHEAST OBLIQUE OF THE STORAGE SHED (LEFT) AND THE OUTBUILDING (RIGHT)

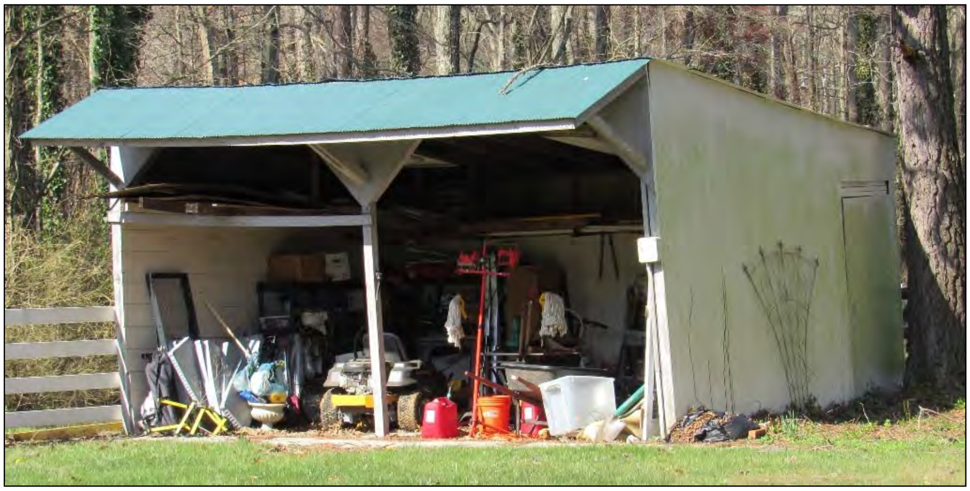

FIGURE 3-127: GARAGE, NORTHEAST OBLIQUE

3.11.3 NRHP Evaluation

The Charles Gwathmey House is a high-style, Queen Anne dwelling built circa 1886 in the small rural community of Gwathmey, south of Ashland. The resource is in good condition and retains a high level of integrity of location, feeling, and association. The setting of the resource has been somewhat changed as a small inground pool, two outbuildings, and a couple different types of fences have been added to the lot. A number of additions and modifications to the house have also changed its appearance over time, although much of the work has used similar construction methods and materials as the original core. As such, the resource retains a moderate level of integrity of setting, design, materials, and workmanship.

Archival research did not indicate that the Charles Gwathmey House is associated with any important events that have made a significant contribution to broad patterns in American history. As such, it is recommended not eligible under Criterion A.

For a resource to be eligible under Criterion B, it must have an association with a person who is "individually significant within a historic context" and has "gained importance within his or her profession or group" (Shrimpton et al. 1990). Furthermore, they "must be shown to have played a distinctively significant role in comparison with others to qualify" a resource as eligible under this criterion (Bolland n.d.). Charles Gwathmey played an important role in the growth of the Gwathmey community, so much so that the area was named in his honor. He donated the land for the Gwathmey Baptist Church and sold much of the rest of his land which formed the Gwathmey community. However, this was a fairly common trend along the RF&P Railroad and in rural crossroad communities within Hanover and surrounding counties, as local property owners turned into entrepreneurs to promote short periods of growth in underutilized areas. Furthermore, Gwathmey was a merchant by trade and is not known to have gained particular prominence within the local development community at large. As such, the Charles Gwathmey House is recommended not eligible under Criterion B.

Although the primary core was built in 1886, at least five building periods are thought to have subsequently affected the appearance of this house, most of which date from the early- to mid-twentieth century. Though it has undergone a number of interior and exterior changes over time, the core of the original building remains intact and is in generally good condition. Furthermore, many of these original features are hallmarks of the Queen Anne style: differing wall textures, simulated overhangs between the first and second stories, cut-away bay windows, towers, and elaborate front porches (McAlester 2013:348). These character-defining elements still collectively reflect the home's elaborate Queen Anne style and contrast with the rest of this small crossroads community. Though there have been 34 Queen Anne-style dwellings recorded in Hanover County, most are located in the county seat and larger Town of Ashland. The Charles Gwathmey House faces the railroad and was designed as a stylish showpiece to encourage the development and purchase of Charles Gwathmey's land around this small railroad stop and serves as a good example of high-style Queen Anne house in a small rural community. As such, the DC2RVA team recommends this resource as eligible under Criterion C at the local level as a unique example of a rural, high-style, Queen Anne dwelling in Hanover County**.** As an architectural resource, it was not evaluated under Criterion D.

In sum, the Charles Gwathmey House is **recommended eligible under Criterion C at the local level for its unique architecture.**

The proposed period of significance for this resource is based on its construction date circa 1886. The proposed NRHP boundaries for Charles Gwathmey House, as determined during the current investigations, conform to the existing tax parcel (Parcel ID 7779-52-0113) including the outbuildings and landscape features (Figure 3-128).

3.12 SINTON HOUSE (042-0420)

The dwelling known as the Sinton House is located at 12081 Holly Oaks Lane, on the west side of Holly Oaks Lane and the railroad tracks within the rural community of Gwathmey, south of Ashland in Hanover County, Virginia (Figure 3-129). The circa-1890 building, set slightly back from the roadway in the eastern half of a triangular lot measuring approximately 5.1 acres, is primarily surrounded by a manicured lawn heavily dotted with deciduous trees. The west half of the parcel is filled with deciduous and coniferous trees. The property is accessed by a graveled driveway that extends from the road, east to the building's primary entrance. The southern boundary of the drive is lined with shrubbery. The east elevation (façade) is lined with a plant bed dotted with shrubbery as is the east elevation of an associated shed. Secondary resources are a workshop, shed, and three wells.

3.12.1 Historic Context

The Sinton House (042-0420) is situated on a large tract of land that was transferred from Henry and C. Saunders to Charles B. and Caroline B. Gwathmey in April 1886. After receiving this tract, Gwathmey divided it and sold various parcels.

William Sinton purchased 3.1 acres of Gwathmey's land for $155 according to a deed dated June 25, 1890 (Figure 3-130). Census records indicate that Stinton worked as a bank cashier at the turn of the century (U. S. Census 1900). Sinton's acquisition of this lot in addition to his other holdings made for a total of 6.1 acres (HaCDB 26:146, 34:315, 43:465). The house was built with Queen Anne-style attributes, which was popular during the late-nineteenth century. This style was especially prevalent within dwellings located along the railroad, as the transportation system allowed local lumber yards to stock pre-cut millwork from outside the area, and it was easy for builders to apply this pre-cut trim to houses (McAlester 2013:398).

Upon William Sinton's death, the 6.1 acres and Sinton House were willed to his sisters, Jane G. and Eugenia Sinton. The two quickly sold the land to Charles C. Reed for $4,000, in 1911 (HaCDB 55:79). The property was sold three more times over the next 10 years at which time it was purchased by Elizabeth W. Lewis (HaCDB 72:113). In September 1946, Lewis transferred 4.9 acres of the parcel to Louis George Hillquist and Sophia Vaughan Hillquist (HaCDB 125:79).

The 4.9-acre parcel along with the Sinton House was deeded from the Hillquists to Alice Marie Reilly in April 1951 (HaCDB 141:96). Alice Marie Reilly was the only daughter of Mr. and Mrs. John V. Reilly. Mr. Reilly, who had retired from a career in banking in New York City, moved his family south to Ashland in 1950 before purchasing the Sinton House, referred to during their ownership as Holly Oaks. The Reillys "brought with them to Ashland a long interest in horses… and although 'Holly Oaks' was just a few acres, they kept one or two horses there" (Ashland Sesquicentennial Committee 2009:328). The Reillys were also musicians, and Alice played organ at the Catholic church for much of her time in Ashland. Alice Reilly never married or had children but lived in the Sinton House until she sold it to David B. and Cynthia P. McNamara in 1997. Over the next decade, the house went into foreclosure, and was bought by Bruce and Donna Folkes in 2009 (HaCDB 2507:408, 2933:424, 2961:1002). Giancarlo Pimpinella is the current owner of the Sinton House (HaCDB 2978:1448).

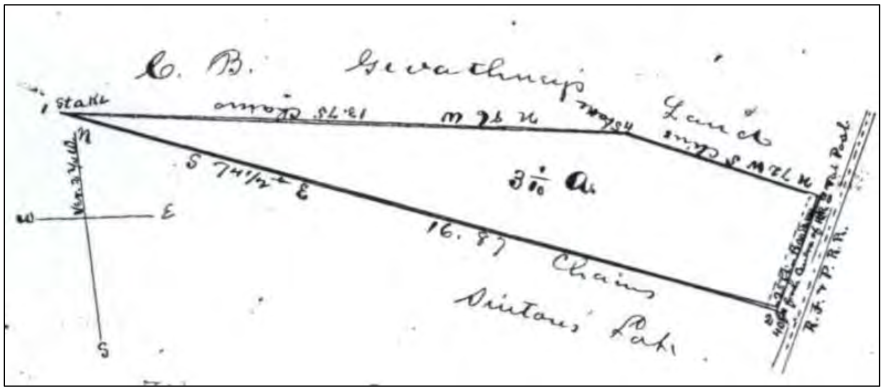

Figure 3-130: Detail of 1890 Plat Showing 3.1-Acre Tract Between “Sinton’s Lot” and Gwathmey’s Land (Hacpb 2:94) (Not To Scale)

3.12.2 Architectural Description

3.12.2.1 Primary Resource Exterior

The resource known as the Sinton House at 12081 Holly Oaks Lane is a two-and-a-half-story, three-bay, single-family dwelling constructed circa 1890 with Queen Anne details (Figure 3-131 through Figure 3-136). Its continuous brick foundation supports a frame structural system currently clad in aluminum-shingle siding. The dwelling is covered by a low-pitched, hipped roof with three gabled projections, all sheathed in asphalt shingles and featuring tight, boxed eaves. The projections extend from the east half of the north elevation, north half of the east elevation, and south half of the west elevation. The east projection features a decorative, sawn, wood gable ornament in the eave (Figure 3-134). Some decorative, metal, ridge cresting was also observed. Two brick chimneys with corbeled caps pierce the roof slope: one north of the gabled dormer and another in the south half of the building (Figure 3-134). The northern chimney stack features a metal hood. A front-gabled dormer, clad in aluminum shingles, dots the south half of the façade (Figure 3-135).

Centered on the east elevation is a single-leaf, half-glazed, paneled-wood door protected by a decorative wood-and-screen storm door. The door is asymmetrically arranged with a leaded, wood-frame transom extending across the entrance and a multi-light, wood-frame sidelight with fluted trimwork. Window openings throughout much of the house are filled with single and paired, two-over-two (vertical muntins), wood-frame, double-hung sashes. The dormer holds a pair of square wood-frame lights that have either fixed or casement sashes. A one-story bay window projects from the north end of the façade and is filled with one-over-one, double-hung, replacement windows.

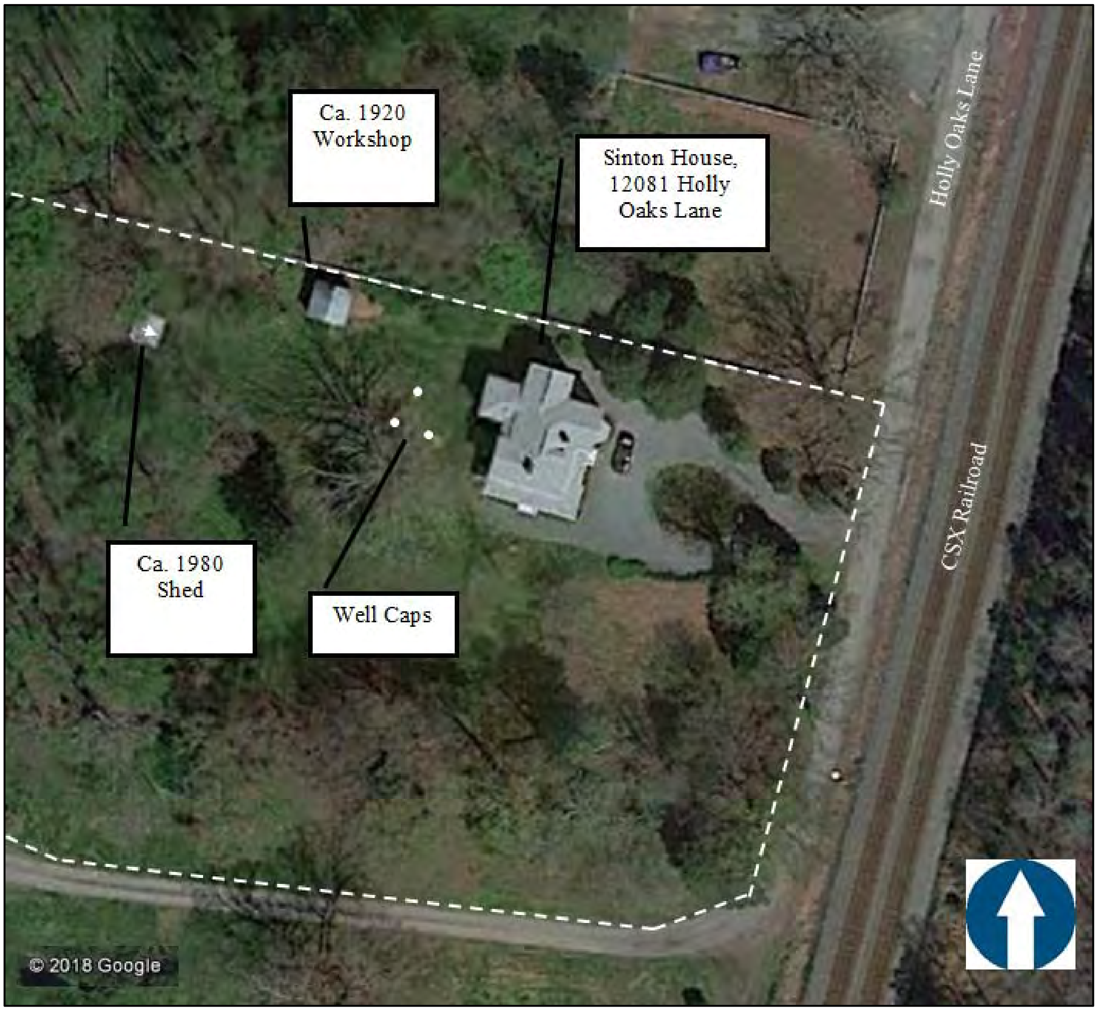

FIGURE 3-131: SITE PLAN OF THE SINTON HOUSE (GOOGLE 2018) (NOT TO SCALE)

A one-story, wrap-around porch set on wood piers, filled with wood lattice between posts, stretches from the east to the south elevation. It is covered by a shed roof sheathed in asphalt shingles, and supported by turned wood posts, some of which are recent replacements, with decorative bracketing. The porch is accessed by a set of wood stairs at the east and south elevations.

This resource features a rear (west) addition that is covered by a hipped and shed roof and is composed of the same materials as the main block (Figure 3-136). The chronology of the additions is unknown, but exterior siding on the eastern wall of this rear addition suggests it was incorporated into the main block after construction. Fenestration in this section of the building consists of four-over-four, wood-frame, double-hung-sash windows. A paneled wood door is located in the second story of the west elevation, suggesting the removal of a two-story porch or set of stairs at one point in time. A rounded, brick stoop with four steps is situated in front of a secondary entrance in the hipped addition. A concrete bulkhead, likely a cellar entrance, is situated in the southwest corner of the building; it is covered by a wood board-and-batten door.

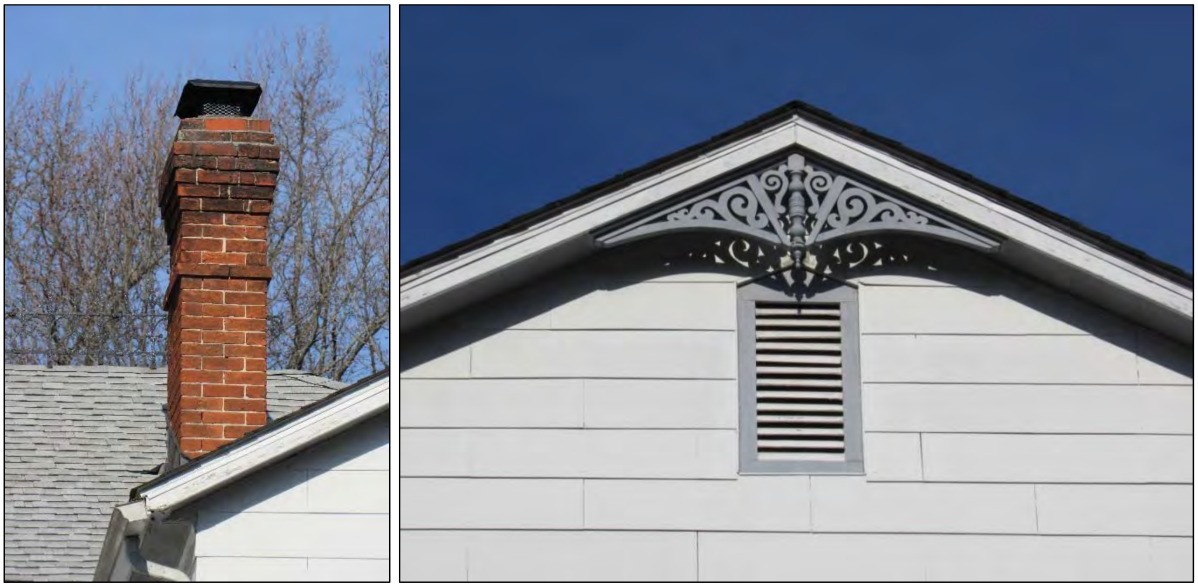

FIGURE 3-134: DETAIL OF CHIMNEY (LEFT) AND GABLE ORNAMENT (RIGHT)

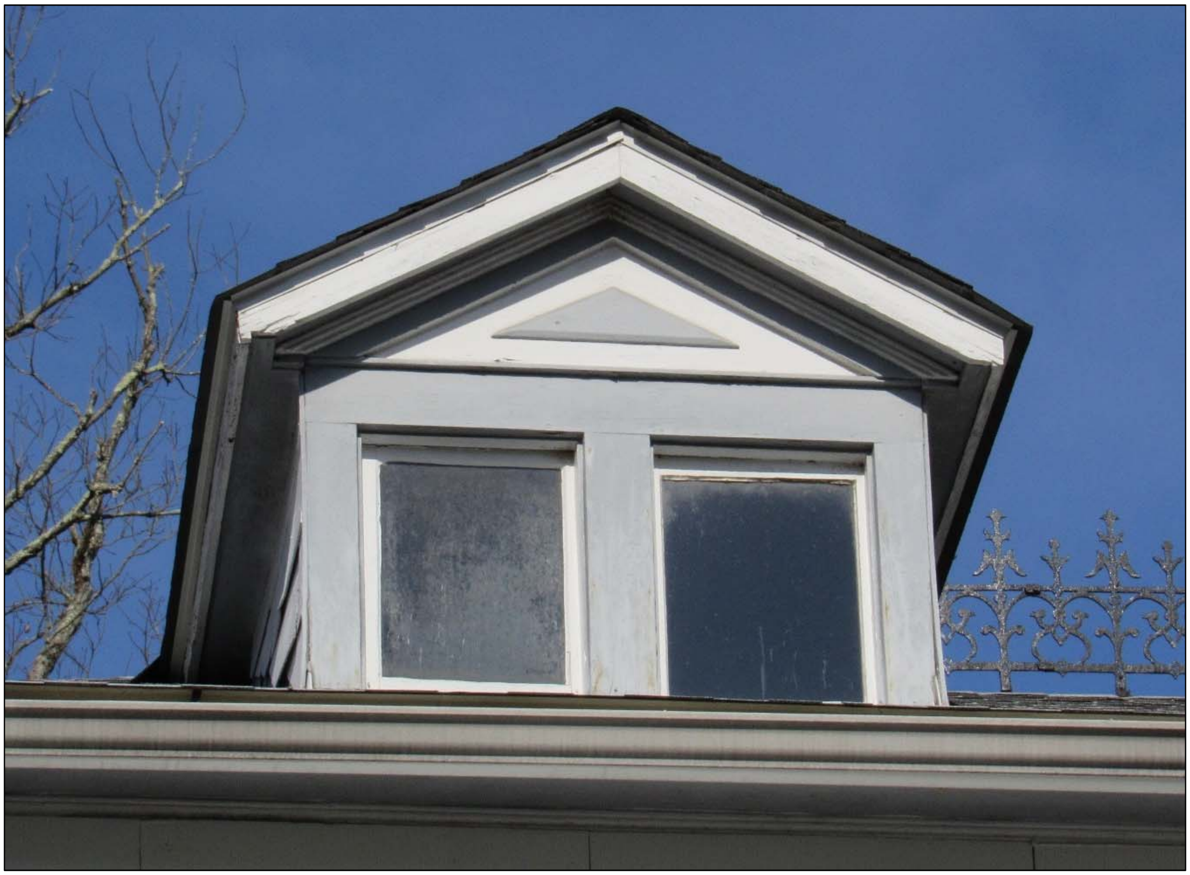

FIGURE 3-135: DETAIL OF DORMER

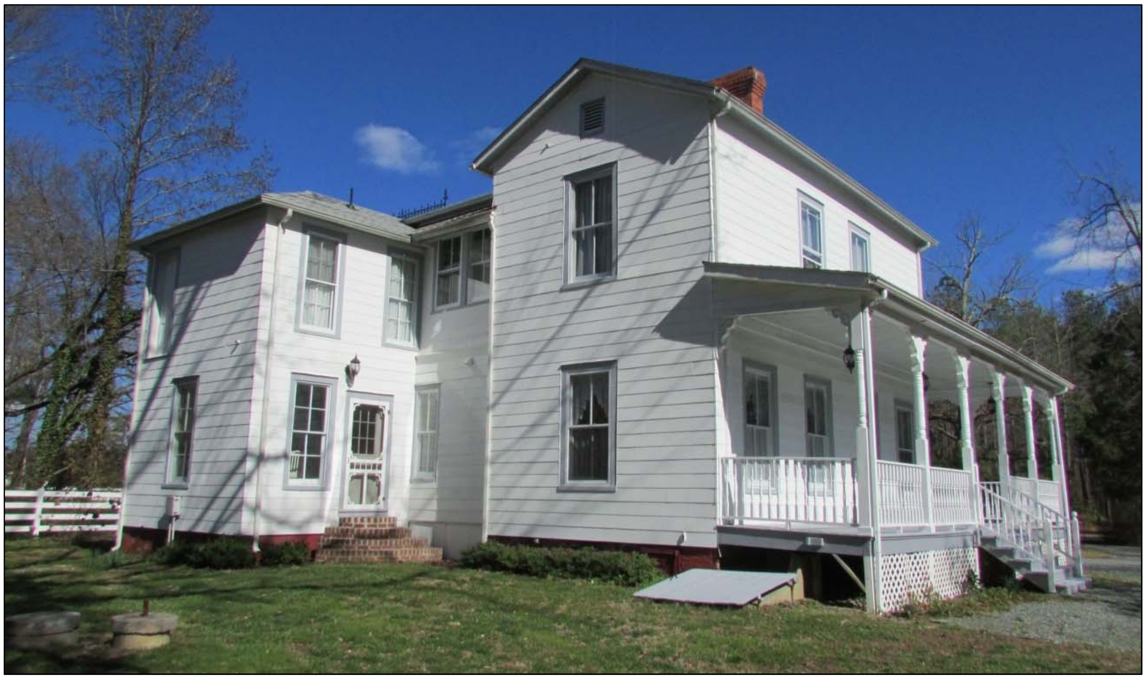

FIGURE 3-136: VIEW OF SOUTHWEST OBLIQUE SHOWING KITCHEN ADDITION AT LEFT

3.12.2.2 Primary Resource Interior

The Sinton House has a typical late-nineteenth- century interior plan where the primary entrance opens to a central corridor with formal rooms on either side and a stairway providing access to the second story (Figure 3-137 and Figure 3-138). Two formal rooms sharing a central fireplace are situated on the left side of the corridor. A front parlor with fireplace and bay window is to the north of the hall. A staircase with spindle balustrade is located beyond the front parlor and turns to the west as one ascends. An office is located in an addition beyond the stair on the first floor. A kitchen addition at the rear of the first story contains a brick chimney at the north end and a bathroom at the south end, accessed by a private corridor. The bathroom is located on the former exterior wall of the original core and has a two-over-two, double-hung-sash window which looks into the hallway. More information is required to assess if the woodwork and trim is original to the house, but the bullseye corner blocks and overmantels at the first floor appear to be in keeping with the style and date of construction.

The second story has a similar arrangement to the first as five bedrooms located off the central corridor with open staircase, four of which appear to be part of the original plan (Figure 3-139). In the addition above the kitchen is a bedroom at the second story, accessible via a narrow corridor with exposed weatherboard siding. Two bathrooms are located on the second story. All doorways on this story are filled by single-leaf wood doors.

The attic was inaccessible during this survey.

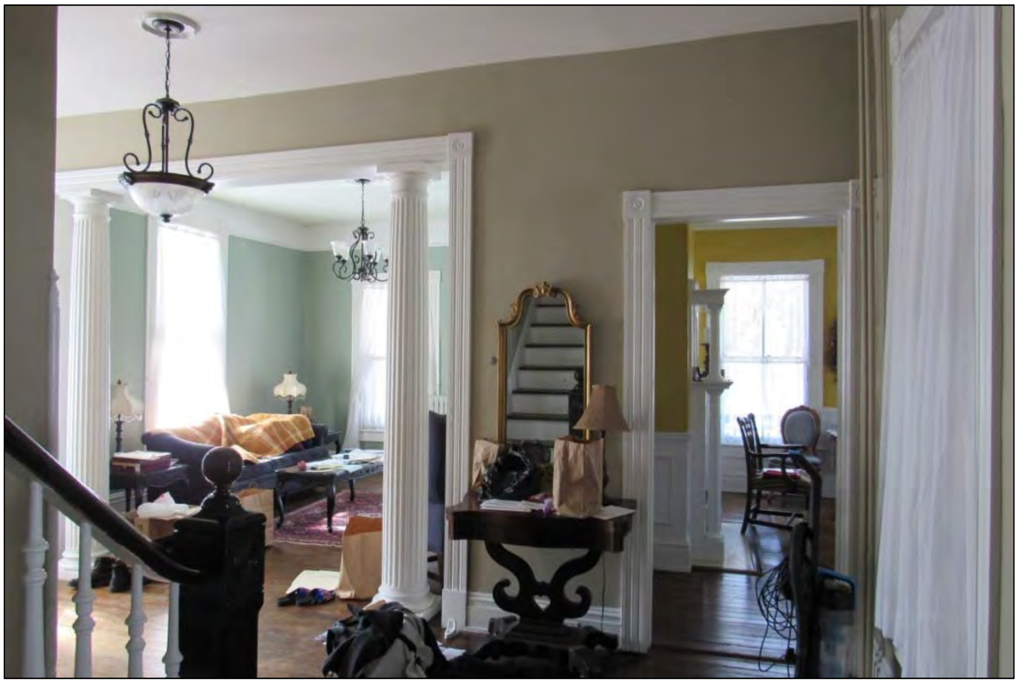

FIGURE 3-138: FIRST STORY, LOOING SOUTH FROM CENTRAL STAIR

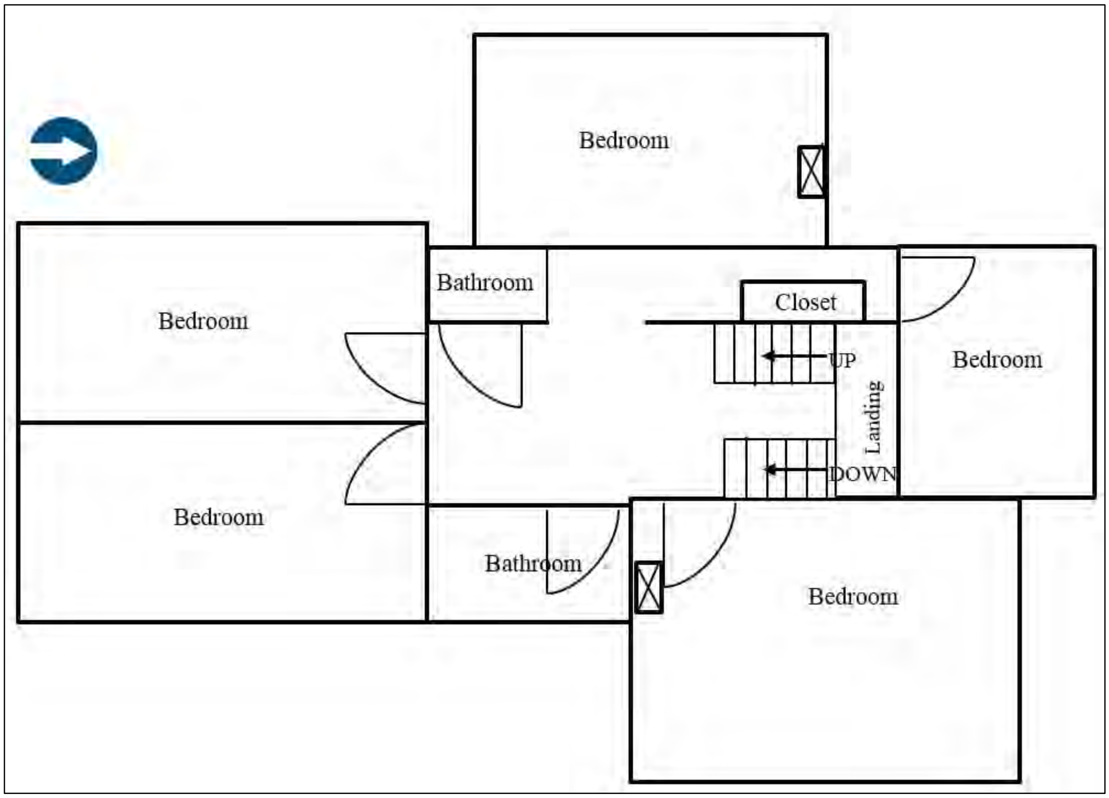

FIGURE 3-139: APPROXIMATE SECOND-STORY FLOOR PLAN (NOT TO SCALE)

3.12.2.3 Secondary Resources

Two outbuildings and several well caps are associated with the property (Figure 3-140). A one-story, one-bay, possible workshop constructed circa 1890 is located northwest of the dwelling. The wood-frame building is sheathed in weatherboard with wood corner boards and covered by a front-gabled, v-crimp-metal-clad roof. An interior-end, brick chimney is centered on the north elevation. A single-leaf, five-paneled, wood door is accessed by a wood ramp on the south elevation. Other fenestration includes six-over-six, wood-frame, double-hung-sash windows.

West of the dwelling, a circa-1950, one-story, frame shed is covered in T1-11 siding and topped by a shed, v-crimp-metal-clad roof. A double-leaf wood door accessed by a wood ramp is located on the south elevation. A shed lean-to supported by square wood posts extends from the north elevation.

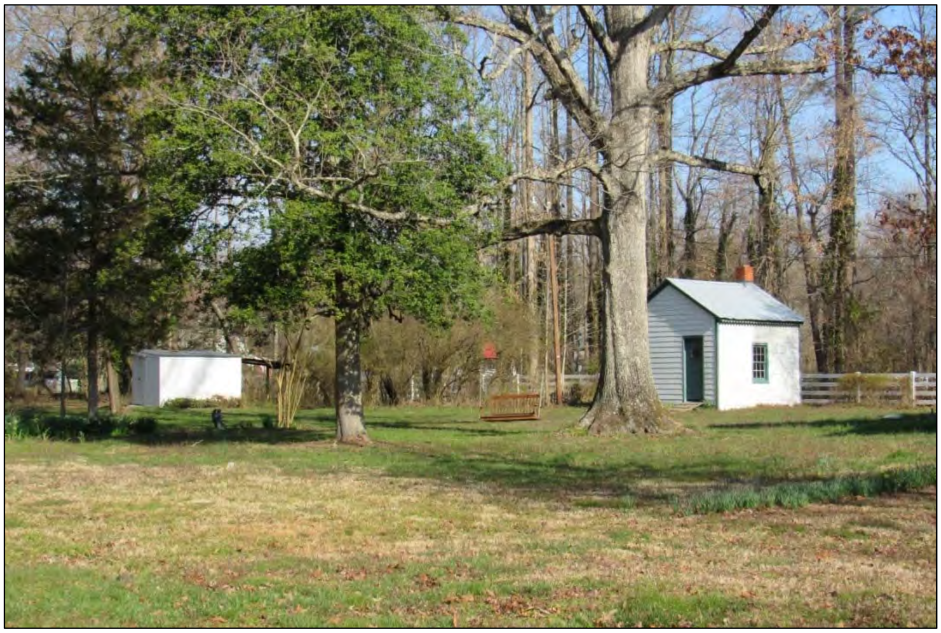

FIGURE 3-140: VIEW OF WORKSHOP AND SHED FACING NORTHWEST

3.12.3 NRHP Evaluation

The Sinton House, located at 12081 Holly Oak Road in the community of Gwathmey, is a single-family dwelling with Queen Anne details constructed circa 1890. Although it is in good condition and retains a high level of historic integrity of location, feeling, and association, modifications over time to the property have somewhat diminished its integrity of setting, design, materials, and workmanship.

According to the NPS, "to be considered for listing under Criterion A, a property must be associated with one or more events important in a defined historic context… The event or trends, however, must clearly be important within the associated context… and it must retain historic integrity" (Shrimpton et al. 1990). Archival research did not reveal any associations with important events in history, therefore, the Sinton House is recommended not eligible under Criterion A.

In order for a resource to be eligible for the NRHP under Criterion B, it must be associated with a person who is "individually significant within a historic context" and has "gained importance within his or her profession or group" (Shrimpton et al. 1990). The Sinton House has no known association with any significant person and is, therefore, recommended not eligible for the NRHP under Criterion B.

The dwelling has marked features of the Queen Anne style: decorative spindlework and wrap-around porch, complex roof line, and an asymmetrical façade and floor plan, among other details. However, these elements are not high style and border on what is called Folk Victorian in their construction. Furthermore, there are many examples of the Queen Anne style in Hanover County as it was popular throughout the late-nineteenth century and into the early-twentieth century. Nearby Ashland contains dozens of examples of this style of dwelling built through the 1870s to the 1890s. Modifications at the Sinton House have made an effort to blend in with existing Queen Anne elements, but replacement materials—including some windows, porch features, and interior fixtures—have negatively affected its integrity of design, materials, and workmanship. For these reasons, this resource is recommended not eligible under Criterion C. As an architectural resource, this property was not evaluated under Criterion D.

In sum, the Sinton House is **recommended not eligible under Criteria A–C.**

3.13 ELMONT HISTORIC DISTRICT (042-5048)

The Elmont Historic District (042-5048) highlights an unincorporated community in Hanover County situated east of the current CSXT rail line where two thoroughfares, Cedar Lane and Elmont Road, intersect. At its western boundary are the remains of the Richmond-Ashland Trolley Line (043-5347), and at the southern tip is a modern residential development at Chiltern Hills Court. Although several secondary roads have been recently constructed in the district, including Old Washington Highway, Kenwood Church Road, Cobb Road, and Oak Lawn Lane, the boundary roughly follows Elmont Road from its intersection with the railroad southeast to its intersection with Cedar Lane and follows Cedar Lane from the railroad east to Brazile Road (Figure 3-141). Trains still run on this line as part of CSXT's RF&P Subdivision and the Amtrak system. Development within the district boundaries spans from around 1880 to present day and includes approximately 60 resources. Property types within the Elmont Historic District include residential, commercial, religious, educational, and recreational resources.

3.13.1 Historic Context

The Elmont Historic District features a rural community situated between the RF&P Railroad and the Richmond-Ashland Electric Railway, also known as the Richmond-Ashland Trolley Line (042-5347), situated south of Ashland and north of the Chickahominy River in Hanover County. Hanover County, founded in 1720, was settled by plantation owners and tobacco farmers, and remained fairly agricultural throughout the nineteenth century with a network of roads linking farms, ferry crossings, mills, and taverns (Figure 3-142) (Hanover County, Virginia 2018; Land and Community Associates 1992). However, an increase in population and development was spurred by the introduction of rail transportation to the area. The RF&P Railroad was laid out through the county beginning in 1834, and by 1836, the first train from the north passed through Ashland (Land and Community Associates 1992). Prompted by the development and success of the railroad, Elmont was originally a stop on the RF&P Railroad named Kilby "for the gallant Hanoverian who served in the United States Navy" in the Revolutionary War, John Kilby (Figure 3-143) (Hanover County Historical Society 1993:16). John Kilby served on the Bon Homme Richard under John Paul Jones (Page 1926:64).

FIGURE 3-142: GENERAL AREA OF THE FUTURE LOCATION OF ELMONT ON CIRCA-1860 MAP (HOTCHKISS MAP COLLECTION 186?). NOTE THE PRIMARILY AGRICULTURAL AREA WITH NO CONCENTRATED VILLAGE. (MAP NOT TO SCALE)

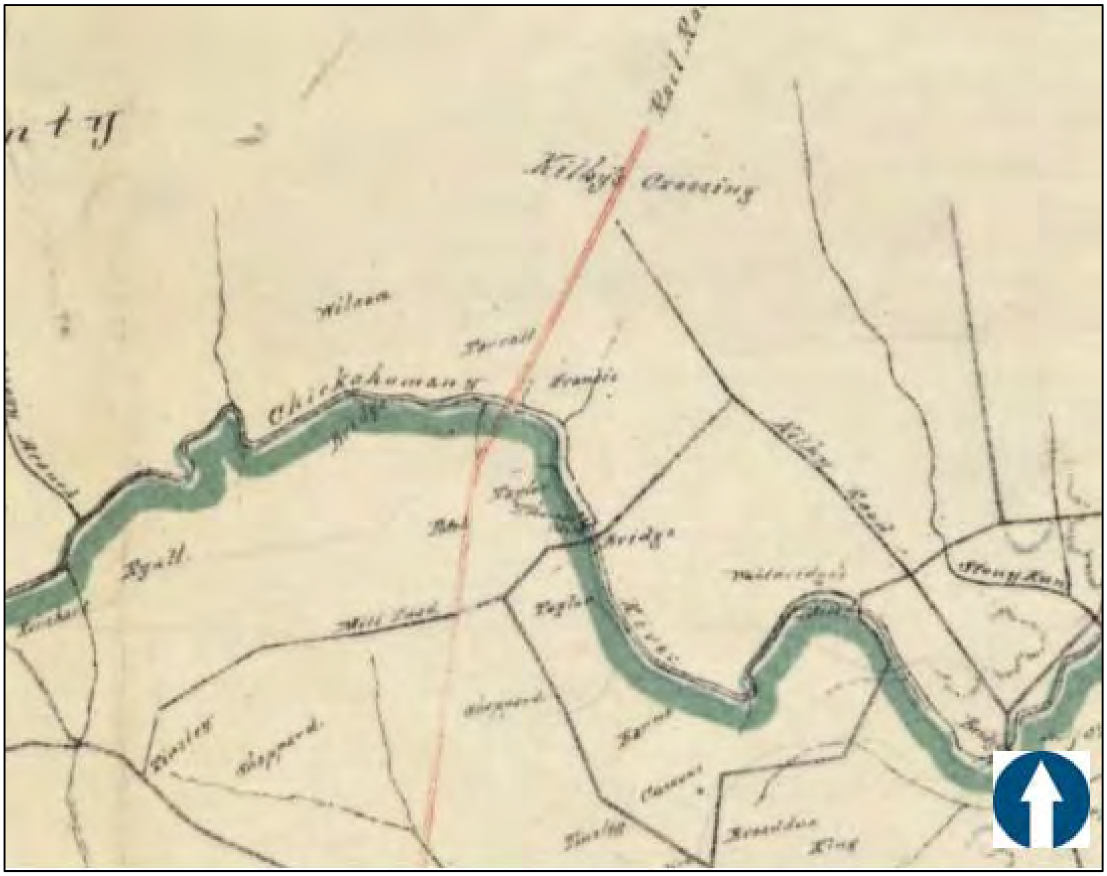

FIGURE 3-143: 1887 MAP OF HENRICO AND HANOVER COUNTIES SHOWING KILBY'S CROSSING (HOEN & CO. 1887) (NOT TO SCALE)

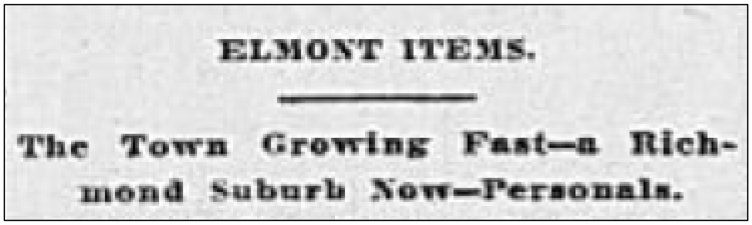
Although the Civil War slowed development as many depots and tracks were destroyed during the numerous battles fought throughout the county, the county entered in a period of rapid expansion, particularly along the rail lines, after the war ended (Hanover County Economic Development 2018; Land and Community Associates 1992:56). Under the direction of the president of the RF&P Railroad, Major Myers, a new station called Kenwood was erected in the area of Elmont at the turn of the century (Hanover County Historical Society 1993:16). In 1902, the *Richmond Dispatch* (1902) boasted that:

> …although Elmont is comparatively a new town, it is building up very fast. The old place was called Kilby and consisted of only one or two residences and a little station building. Now we have a nice little village, and many whose business is in Richmond make their home here, going back and forth to the work on the trains, which run very conveniently for this purpose (Figure 3-144).

A post office was established around 1903 at the stop and named Elmont (Hanover County Historical Society 1993:16). Typical of maturing settlements in the county, commercial and community buildings arose around the intersections or crossroads of roads with the railroad tracks. Stores built in Elmont, such as the Cobb Store (042-0341), were typically frame and were one to two stories in height. Community buildings included Kenwood Methodist Church (042-0337), the Kenwood Community Center (042-0332), and the Elmont Elementary School (042-0333). The community center, which originally included a basketball court and horseshoe pits, is still used by the Ruritan Club, Cub Scouts, and other groups (Land and Community Associates 1992:86–87, 95). The popularity of the RF&P Railroad throughout the county enabled people to move out of the busy cities into the countryside of Hanover and commute for work. In the early-twentieth century, the RF&P Railroad developed the commuter "Accommodation Train," which ran from Ashland into Richmond with stops at Gwathmey and Elmont (Land and Community Associates 1992:79–80).



ELMONT ITEMS.

The Town Growing Fast—a Richmond Suburb Now—Personals.

FIGURE 3-144: HEADLINE FROM 1902 ARTICLE WITH AREA NEWS (RICHMOND DISPATCH 1902)

A similar service was provided by the streetcar. The electric railroad, called the Richmond-Ashland Trolley Line (042-0707), chartered in 1905 as the Richmond & Chesapeake Railway Company, was planned by Frank Jay Gould of New York. Plans for the line hoped to connect Norfolk with Fredericksburg via Petersburg and Richmond with branches to Virginia Beach and the Northern Neck (Land and Community Associates 1992:56–57). It passed through Yellow Tavern, Greenwood, Holly Hill, Cedar Lane, and Elmont on its way to Richmond with 15 stations all "in convenient places along the line" (Richmond Times-Dispatch 1907). Although the line experienced peak passenger travel in 1917 during World War I, it was put up for auction the following year and purchased by a local group who renamed it the Richmond-Ashland Electric Railway (Land and Community Associates 1992:56–57). Effects of the Depression and the eventual success of other means of transportation brought the line to closure in 1937. The route itself was preserved by the construction of power lines.

According to the Land and Community Associates report on historic resources in Hanover County, "increasing importance of the railroad and streetcar transportation" like the RF&P Railroad and the Richmond-Ashland Electric Railway is reflected in the orientation of dwellings and commercial buildings in not only towns but rural areas as well (1992:80). This is only partially true for the village of Elmont. Although a concentration of buildings was established at the intersection of the RF&P Railroad and Elmont Road, many buildings are situated along and facing Elmont Road (Figure 3-145). Residential development occurred in the village during the mid-twentieth century primarily along Elmont Road (USGS 1951, 1963). However, with further modern development came the demolition of several commercial and residential buildings constructed during the height of the village growth (Hanover County GIS 2018).

3.13.2 Architectural Description

The Elmont Historic District comprises a rural community situated between the former RF&P Railroad and the Richmond-Ashland Trolley Line. Spurred by the success of the railroad, the first major wave of development occurred in the late-nineteenth century. Buildings in the district were constructed between 1880 to the present day and include residential, educational, commercial, religious, and recreational property types. Parcels sizes range widely from 0.5-acre lots to 18-acre farmsteads (Hanover County GIS 2018). The roads are not lined with a public sidewalk and properties contain a mix of dense wooded areas, manicured lawns, driveways and parking areas, shrubbery, and plantings (Figure 3-146 and Figure 3-147).

The oldest surviving buildings are single-family dwellings dating to the late-nineteenth century and are typically two-story frame examples of the Queen Anne and Folk Victorian architectural styles, such as the Tom Fogg House (042-0338) on Cobb Road, George Haw House (042-0324) on

Old Farmhouse Road, and House at 11226 Elmont Road (042-0339) (Figure 3-148 and Figure 3-149). Following the turn of the twentieth century, the Colonial Revival style became increasingly popular throughout the district and continued to be used into the 1940s. Early houses built in the Colonial Revival style tended to be two stories in height and of frame construction, such as the Gilman House at 11204 Oak Lawn Lane (042-5204), while later examples often stood one-and-a-half stories with both frame and brick structural systems being common (for example, House at 11397 Cedar Lane (042-5188) and Cobb House at 11237 Elmont Road (042-5750)) (Figure 3-149 and Figure 3-150). Typical decorative features on these dwellings include elaborate door surrounds and round columns on porches.

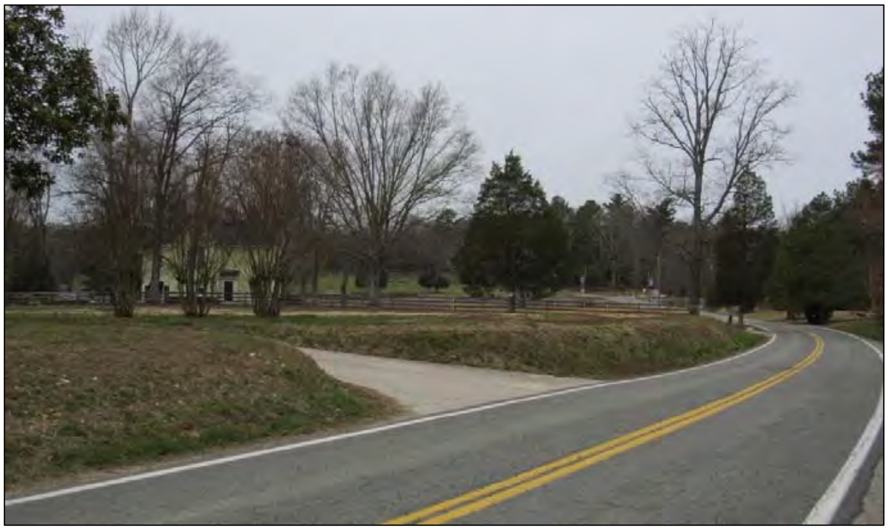

FIGURE 3-146: OVERVIEW OF ELMONT HISTORIC DISTRICT, CEDAR LANE, LOOKING NORTHWEST

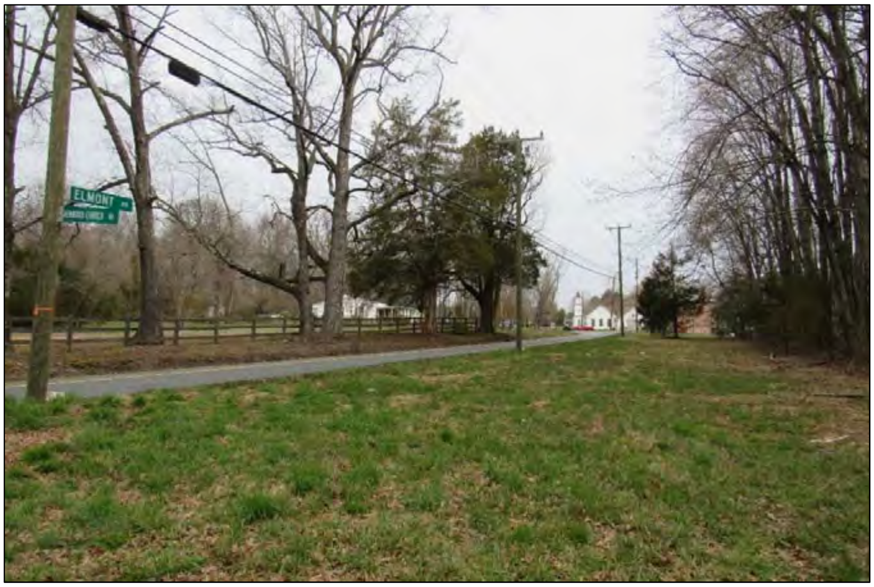

FIGURE 3-147: OVERVIEW OF ELMONT HISTORIC DISTRICT, ELMONT ROAD AT KENWOOD CHURCH ROAD INTERSECTION, LOOKING NORTHWEST

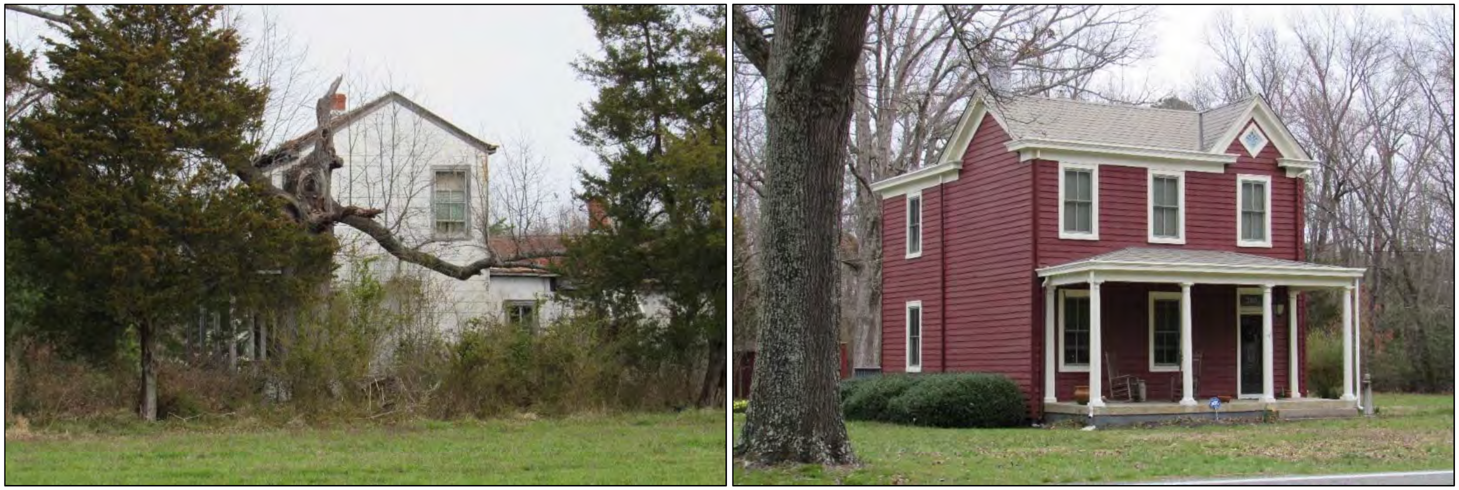

FIGURE 3-148: TOM FOGG HOUSE (042-0338) ON COBB ROAD, SOUTH ELEVATION (LEFT); GEORGE HAW HOUSE (042-0342) ON OLD FARMHOUSE ROAD, WEST OBLIQUE (RIGHT)

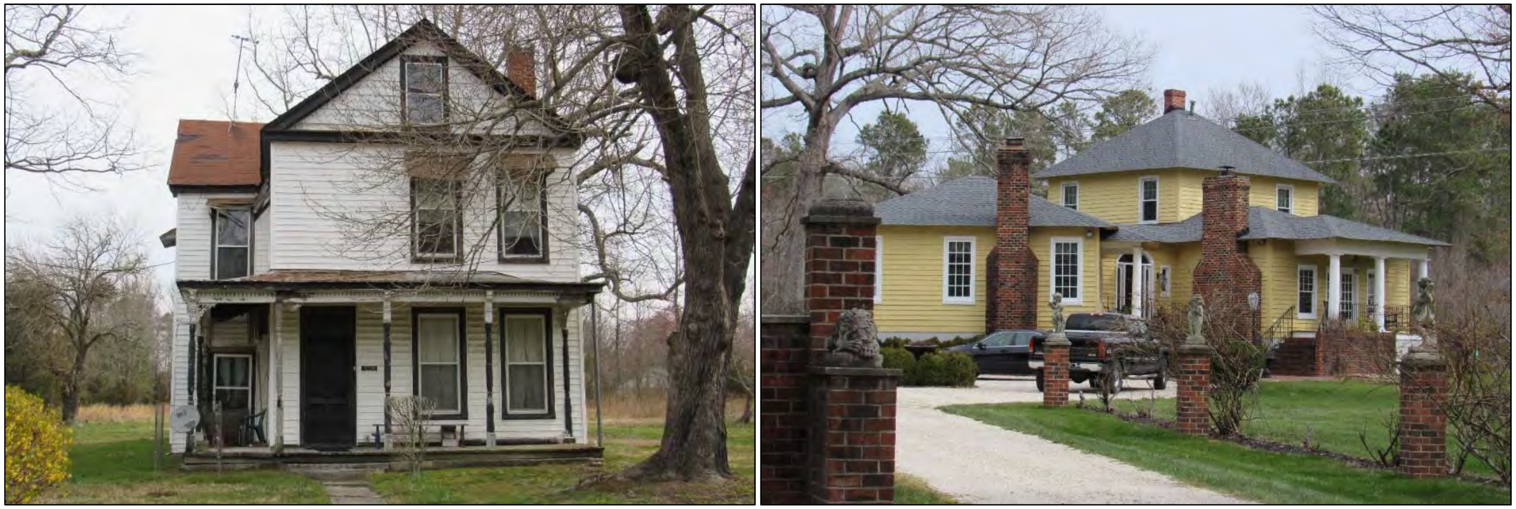

FIGURE 3-149: HOUSE AT 11226 ELMONT ROAD (042-0339), SOUTHWEST ELEVATION (LEFT); GILMAN HOUSE AT 11204 OAK LAWN LANE (042-5204), SOUTH OBLIQUE (RIGHT)

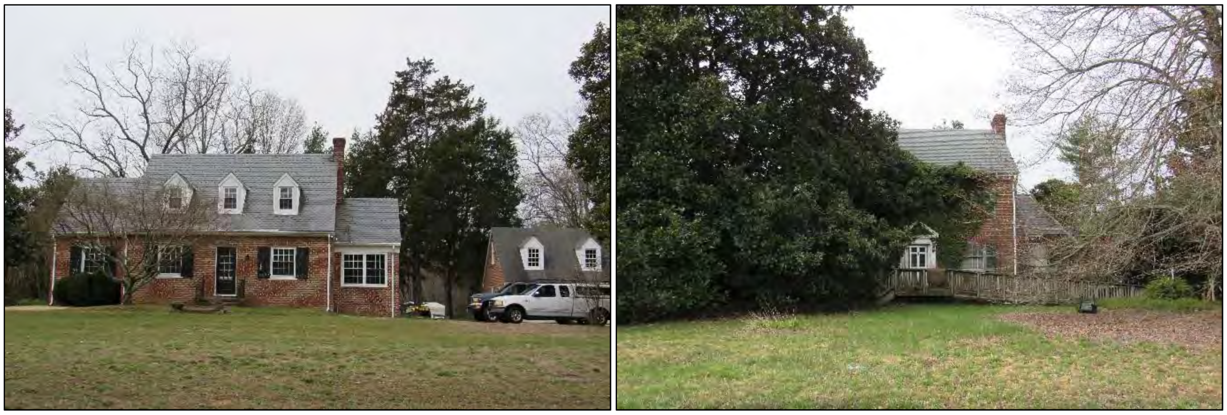

FIGURE 3-150: HOUSE AT 11397 CEDAR LANE (042-5188) (LEFT) AND COBB HOUSE AT 11237 ELMONT ROAD (042-5750) (RIGHT)

By the 1940s, nearly all of the buildings constructed in the district were one- or one-and-a-half stories in height. The Colonial Revival style remained popular; however, houses exemplifying other popular mid-century styles and forms, such as Craftsman, Ranch, Minimal Traditional, and bungalow, begin to dot the landscape during this period (for example, House at 11162 Elmont Road [042-5194] and House at 11168 Elmont Road [042-5195]) (Figure 3-151). Late-twentieth-century development is sparse but does exist in the district. The highest concentration is located near the eastern boundary within the residential Cedarlea Park subdivision.

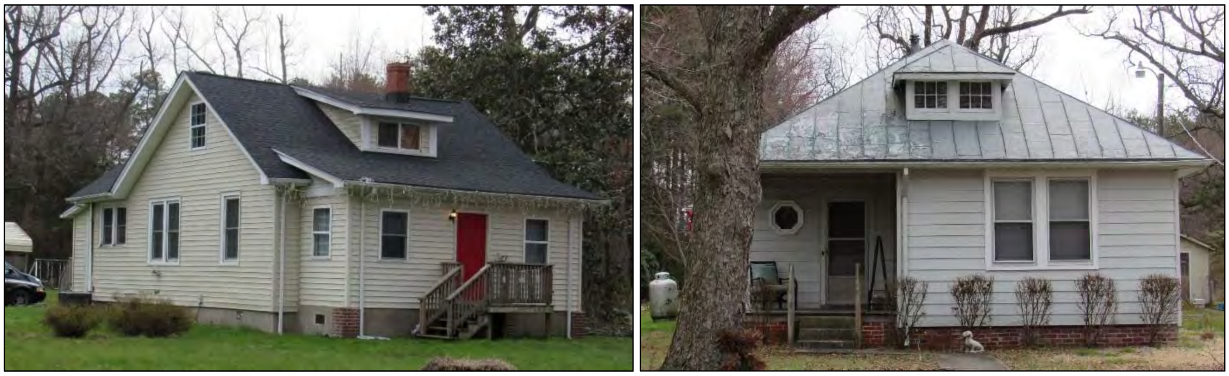

FIGURE 3-151: HOUSE AT 11162 ELMONT ROAD (042-5194), NORTHWEST OBLIQUE (LEFT); HOUSE AT 11168 ELMONT ROAD (042-5195), WEST ELEVATION (RIGHT)

Cobb Store (042-0341), located at the intersection of Elmont Road and the RF&P Railroad, appears to be the only surviving commercial building that dates to the early-twentieth century (Figure 3-152). Breedlove Store (042-0327), another frame store, once stood at the intersection of Cedar Lane and Elmont Road but it is no longer extant. A one-story, concrete-block store, currently known as Elmont Food Mart & Deli and constructed in the mid-twentieth century, is located just north of Cobb Store on Elmont Road (Figure 3-153). One religious building is located within the boundaries of the Elmont Historic District: the Kenwood Methodist Church (042-0337). This late-nineteenth-century ecclesiastical property is one story in height and is a typical example of a rural, frame, church dating to the late-nineteenth century (Figure 3-154).

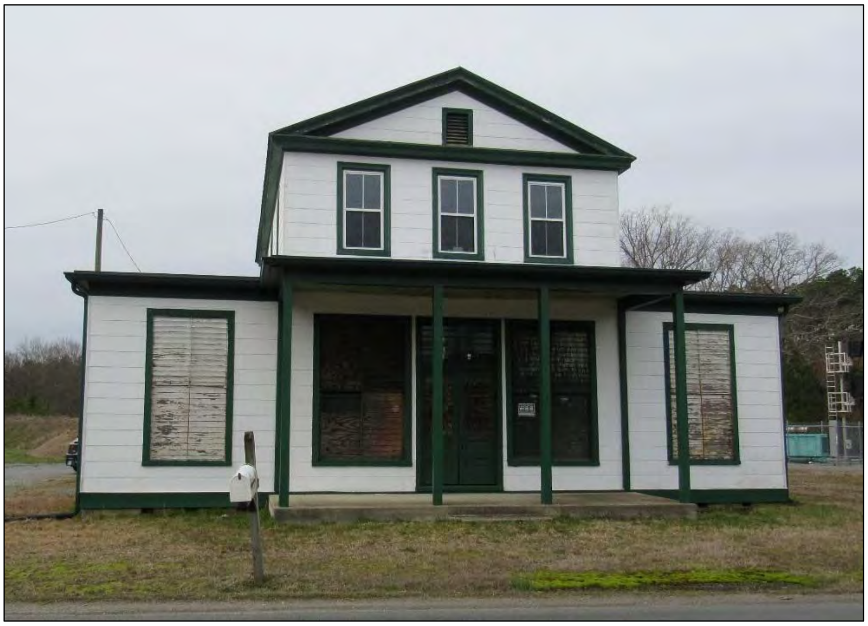

FIGURE 3-152: COBBS STORE (042-0341), NORTHEAST ELEVATION

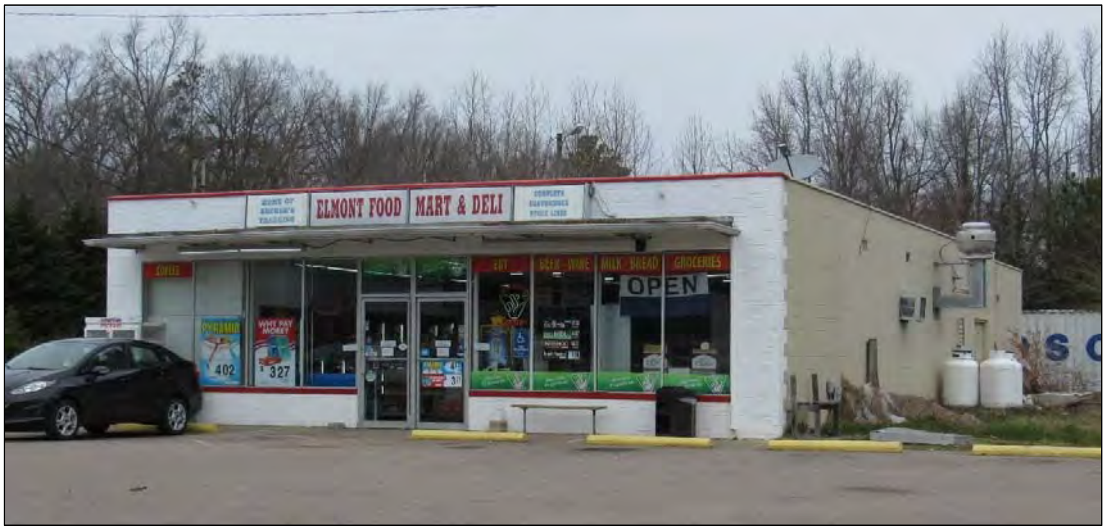

ELMONT FOOD MART & DELI
OPEN

FIGURE 3-153: ELMONT FOOD MART & DELI, SOUTHEAST OBLIQUE

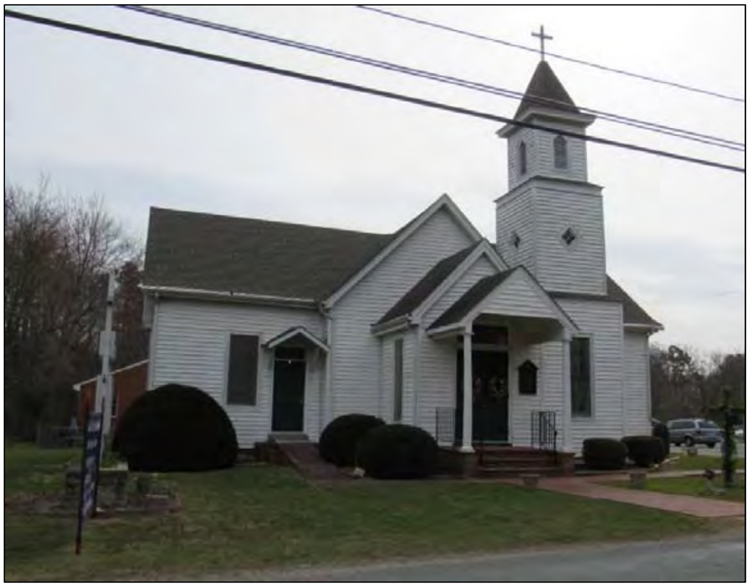

FIGURE 3-154: KENWOOD METHODIST CHURCH (042-0337), WEST ELEVATION

Educational and recreational properties within the district include the Elmont Elementary School (042-0333) and the Kenwood Community Center (042-0332). The school dates to the turn of the twentieth century and is a two-story building clad in wood shingles, unique to this district and the immediate area (Figure 3-155). The Kenwood Community Center is a circa-1900, one-story, frame building on the east side of Elmont Road.

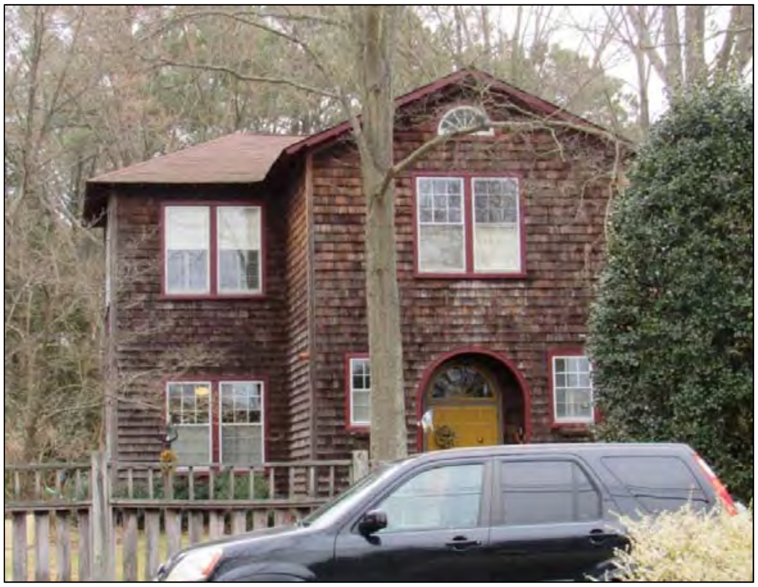

FIGURE 3-155: ELMONT ELEMENTARY SCHOOL (042-0333), WEST ELEVATION

In general, buildings in the district range from one to two stories in height and primarily are built upon continuous foundations. Exterior materials include weatherboard or replacement vinyl siding and brick laid in a stretcher or common bond. They are primarily covered by a side-gabled roof with asphalt shingles, although examples of front-gabled and hipped roofs are present.

Although some resources retain original fenestration, replacement windows are very common. One-story porches ranging in width from one bay to full façade are found on nearly all of the primary resources within the Elmont Historic District.

3.13.3 NRHP Evaluation

The Elmont Historic District is representative of a rural area of Hanover County that slowly developed into a small community beginning in the late-nineteenth century and continuing throughout the mid-twentieth century to present day. This area retains much of its rural character, despite the modern development along its eastern edge. As such, the Elmont Historic District possesses a relatively high level of integrity of location, feeling, and association. Many of the surviving buildings within the district boundaries have undergone common modifications such as window and siding replacement and the construction of additions, and several contributing buildings are no longer extant, rendering the district with a low to moderate level of integrity of materials, workmanship, setting, and design.

The NPS guidelines for evaluating a district under Criterion A state that it must be associated with one or more events or trends important in a defined historic context (Shrimpton et al. 1990). However, they also state that mere association with historic events or trends would not be enough for a district to be considered eligible. Although an example of a railroad community in Hanover County, the Elmont Historic District has suffered a loss of contributing buildings and structures reflecting that period of significance such as the train station, commercial buildings, industrial worker housing, and the electric rail line. Better examples of a railroad community exist throughout the county such as the Doswell Historic District (042-5448). For these reasons, the resource is recommended not eligible for the NRHP under Criterion A. There is not any known association with any significant person or persons from local, regional, or national history; therefore, the resource is also recommended not eligible under Criterion B.

According to the guidelines set by the NPS, for a district to be eligible under Criterion C, it must clearly contain enough distinctive characteristics to be considered a true representative of a particular type, period, or method of construction (Shrimpton et al. 1990). Many of the buildings within the district have undergone alterations such as window and siding replacement, porch replacement or enclosure, and the construction additions to the rear and/or side elevations. There has also been a loss of buildings that were important to the district's history and association with the railroad and other industries in the area: Breedlove Store (042-0327), a circa-1900, rural country store, and the Houses on Sawdust Lane (042-0328), a collection of 15 one-story, frame worker's houses constructed around 1930. Two known historic residences have also been demolished: the circa-1890 Swingle House (042-0340) and the House at 11247 Elmont Road (042-5201). The modern residual subdivision that overlaps with the district's eastern boarder also negatively impacts the district's integrity. Other communities along the RF&P Railroad, such as the Milford Historic District (016-5136) and the Doswell Historic District (042-5448), are better examples of this type of late-nineteenth and early-twentieth century development. For these reasons, the Elmont Historic District is recommended not eligible for listing in the NRHP under Criterion C. As an architectural resource, it was not evaluated under Criterion D.

In sum, the Elmont Historic District is **recommended as not eligible for listing in the NRHP under Criterion A–C.**

3.14 MILL ROAD HISTORIC DISTRICT (043-0693)

The Mill Road Historic District (043-0693) features a village community, locally known as Hunton, in Henrico County situated immediately west of the CSXT rail line where Mill Road, running east to southwest, intersects with the railroad. Located south of the Chickahominy River, the irregularly shaped district follows Mill Road for approximately 1 mile, beginning at the intersection with Old Washington Highway in the east and ending at Long Meadow Drive in the west. Secondary streets in the district include Hunton Crossing Drive, Lavecchia Way, and Nightmuse Way, all of which serve as access roads for modern neighborhoods (Figure 3-156). Trains still run on this portion of the railroad as part of CSXT's RF&P Subdivision and the Amtrak system; however, passenger or freight rail no longer stops at this intersection. The district contains approximately 23 resources, primarily agricultural and residential properties built around 1900 to present day.

3.14.1 Historic Context

Although the RF&P Railroad opened to Fredericksburg from Richmond in 1837, major development did not occur in the area of Henrico County around Mill Road until the late-nineteenth century (Manarin and Dowdey 1984:220–222). Similar to neighboring Hanover County, this part of the county remained fairly agricultural throughout the nineteenth century with a network of roads linking farms, ferry crossings, mills, and taverns (Land and Community Associates 1992; Manarin and Dowdey 1984:339–342). Appearing in maps as early as the 1853 Keily map, Mill Road is said to derive its name from a grain mill, called Taylor's Grist Mill at that time, that was in operation near the gate of the Wilton Plantation in the eastern part of the county along the Chickahominy River (Figure 3-157) (O'Dell 1976:317). This is likely where the crossroads community derived its name, Taylor's Crossing. During the Civil War, Mill Road does not appear to be a primary thoroughfare as it is flanked by thick forest with no buildings depicted immediately on either side of the roadway (Figure 3-158).

FIGURE 3-158: THE APPROXIMATE LOCATION OF THE MILL ROAD HISTORIC DISTRICT (HIGHLIGHTED IN YELLOW) ON AN 1864 MAP OF HENRICO COUNTY (HOTCHKISS MAP COLLECTION 1864) (MAP NOT TO SCALE)

The first wave of development occurred around 1900 when a small commuter station was created at the crossing. Industries popular in the county at the time included manufacturing, canning, woodworking, fertilizing, and meat packing while agricultural practices had a heavy focus on dairy, orchards, and nurseries (Manarin and Dowdey 1984). Several linear lots measuring between 50 to 120 acres were subdivided along the north side of Mill Road that extended to the river while larger tracts were situated on the south side (Figure 3-159) (T. Crawford Redd & Brother 1911). The community at Mill Road and its newfound growth resulted in a need for more local recreational and ecclesiastical buildings. In 1915, a Baptist Church was established at the intersection of Mill and Greenwood Roads on the east side of the railroad tracks (Hunton Baptist Church 2018).

FIGURE 3-159: THE APPROXIMATE LOCATION OF THE MILL ROAD HISTORIC DISTRICT (HIGHLIGHTED IN YELLOW) IN A 1911 MAP OF HENRICO COUNTY (T. CRAWFORD REDD & BROTHER 1911) (MAP NOT TO SCALE)

Around 1930, the RF&P Railroad renamed the passenger station from “Taylor’s Crossing” to “Hunton,” in honor of its late president of almost 12 years, Eppa Hunton, Jr., to avoid confusion with another stop north on the line known as “Taylorsville” (Hunton Baptist Church 2018; McGehee 1992). With the influence of other means of transportation gaining greater acceptance over the railroad, this area began the slow conversion to automobile culture (Wilson 2002:294).

Another wave of development began around this time, encouraging landowners to further subdivide their lots along the road, primarily single-story frame dwellings, potentially for commuter housing. Soon came the development of I-95 in 1957 and Interstate 295 (I-295) in 1987, bringing further suburban development. Major subdivision development at the southern end of the Mill Road Historic District began in 2000 and continues to this day with the addition of a Ryan Homes subdivision in the boundaries of the southern half of the historic district (see Figure 3-156) (NETR 1994, 2004, 2014).

3.14.2 Architectural Description

The Mill Road Historic District encompasses the community of Hunton that developed at the turn of the century. Buildings in the district were constructed between 1900 and the present day and include residential and agricultural property types. Parcels sizes range widely from 0.5 acre to 20 acres (Henrico County GIS 2018). The road is not lined with a public sidewalk and properties contain a mix of dense wooded areas, manicured lawns, driveways and parking areas, shrubbery, and plantings (Figure 3-160 and Figure 3-161). Dwellings in the eastern half of the district, nearest to the railroad, are set closer to the road while several in the western half are set back at a distance.

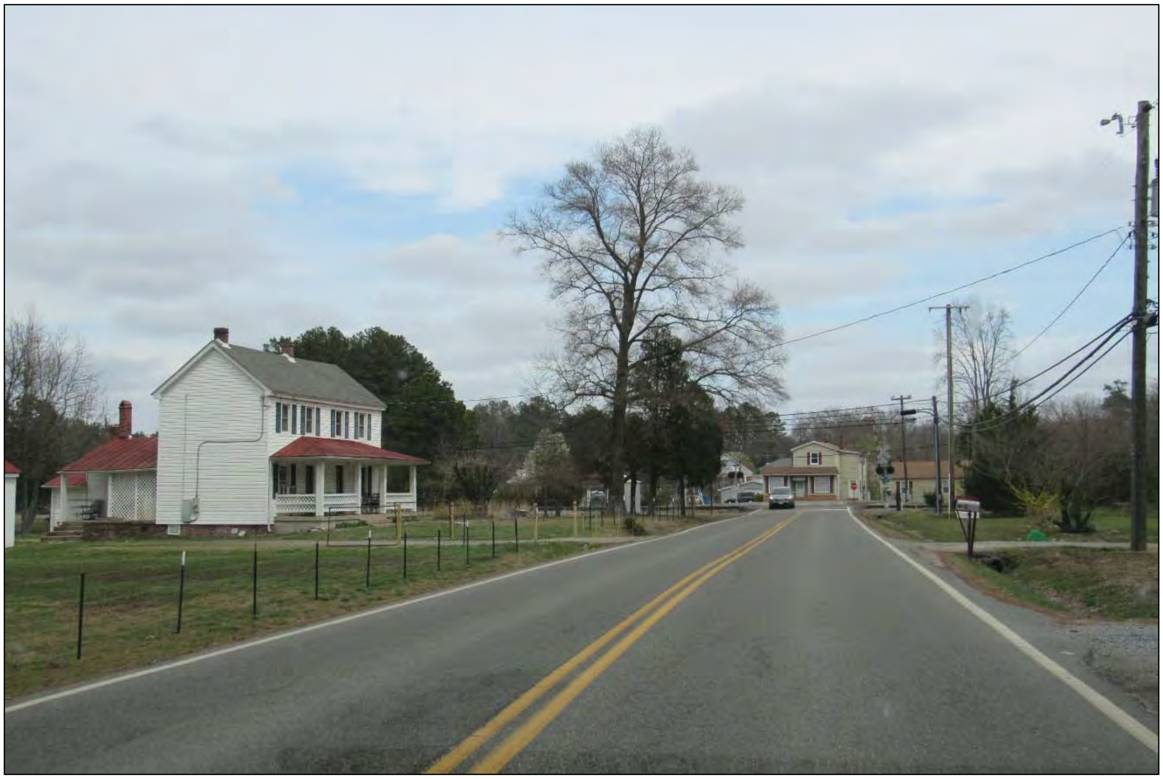

FIGURE 3-160: OVERVIEW OF MILL ROAD HISTORIC DISTRICT, MILL ROAD AT HUNTON CROSSING DRIVE LOOKING EAST TOWARDS RAILROAD

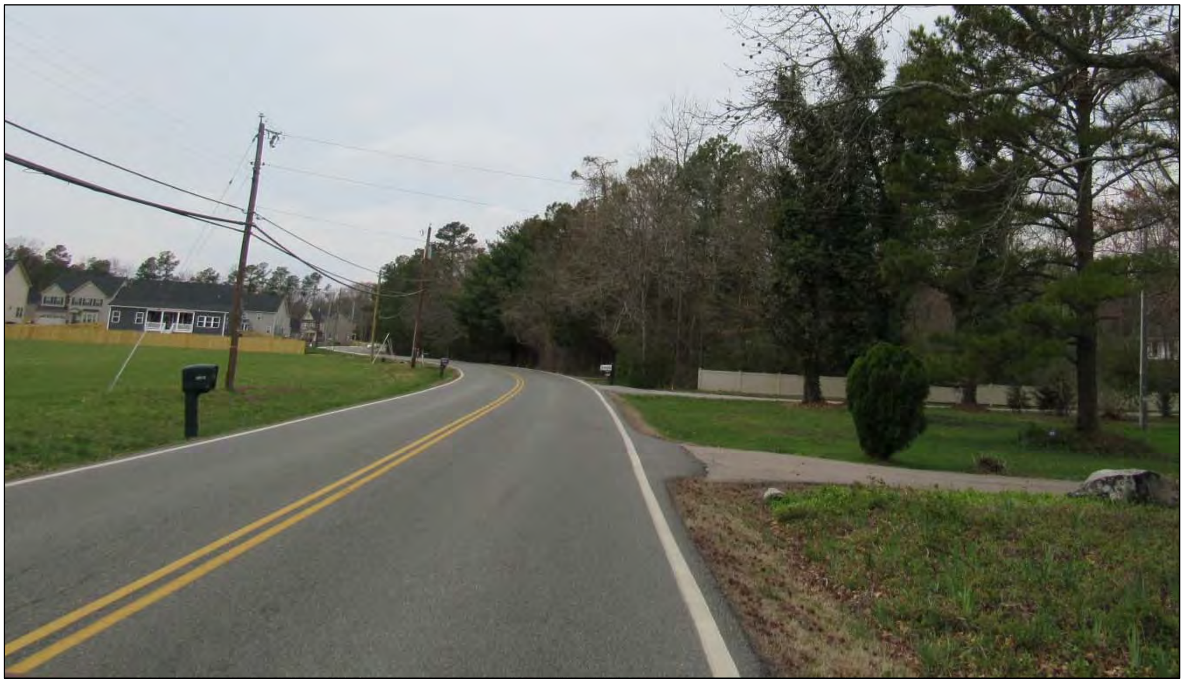

FIGURE 3-161: OVERVIEW OF MILL ROAD HISTORIC DISTRICT, MILL ROAD AT CREERY ROAD, LOOKING WEST AT NEW DEVELOPMENT

The oldest surviving buildings date circa 1900 and are typically two-story, frame houses with elements of the Folk Victorian architectural style in vernacular forms like the I-house. Examples of the muted Folk Victorian style include the House at 11786 Mill Road, House at 11754 Mill Road, House at 11754 Mill Road, and House at 11701 Mill Road. Good examples of I-houses include the House at 11934 Mill Road and House at 11931 Mill Road (Figure 3-162 and Figure 3-163). These houses typically include a single-story, full-width porch with turned posts or Tuscan-style columns. One unique example of a vernacular dwelling with Folk Victorian influences was built circa 1933: House at 11531 Mill Road. This frame dwelling features a wrap-around porch with turned wood posts and brackets, while the roof features eave returns and a thick molded cornice (Figure 3-164).

Following the initial phase of development, the Craftsman and Minimal Traditional styles became increasingly popular throughout the district and continued to be built into the 1940s. Early houses in the Craftsman style range from one-and one-half-story bungalows to two-and-one-half-story American Foursquares, all of which are of frame construction and feature very little ornamentation (for example, House at 11700 Mill Road, House at 11640 Mill Road, and House at 11688 Mill Road) (Figure 3-165). Several of these dwellings include dormers, gable or hip, and full-width porches with tapered posts or Tuscan-style columns.

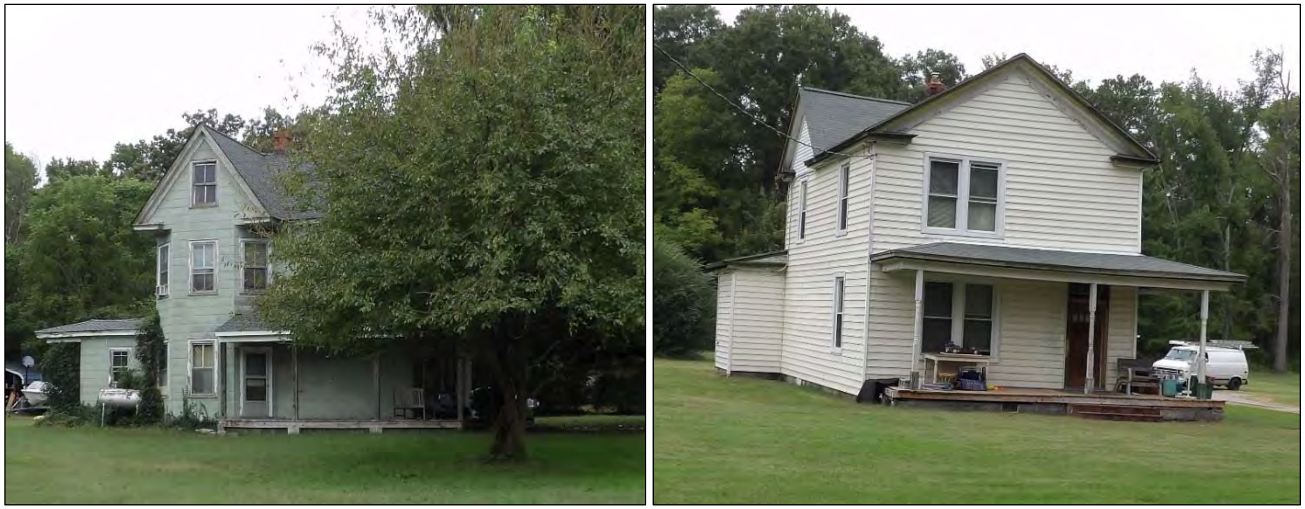

FIGURE 3-162: HOUSE AT 11773 MILL ROAD, NORTHWEST OBLIQUE (LEFT); HOUSE AT 11754 MILL ROAD, SOUTHEAST OBLIQUE (RIGHT)

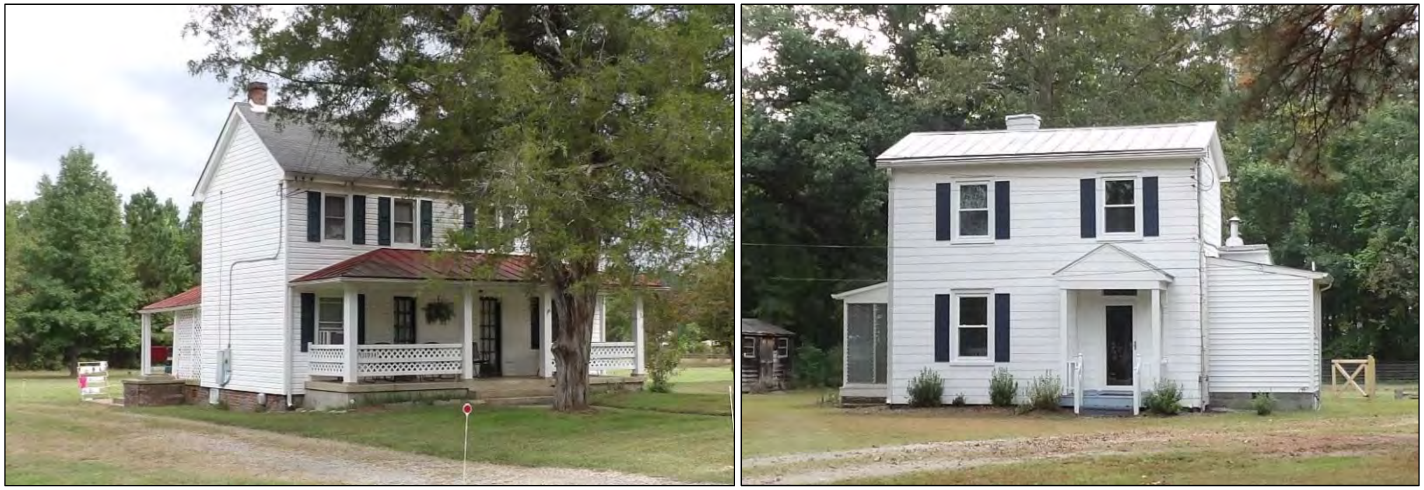

FIGURE 3-163: HOUSE AT 11934 MILL ROAD, SOUTHWEST OBLIQUE (LEFT); HOUSE AT 11931 MILL ROAD, NORTH ELEVATION (RIGHT)

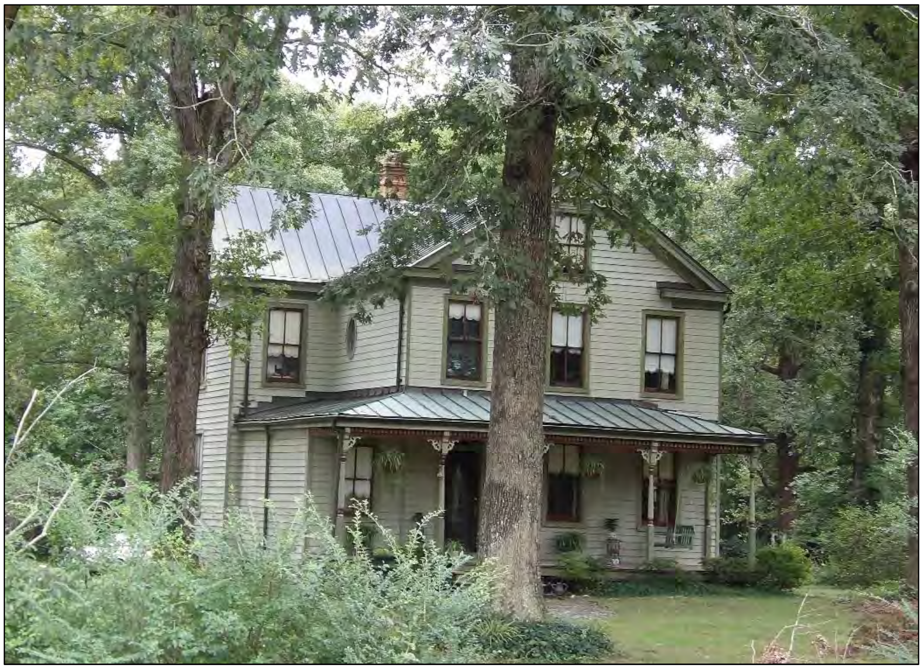

FIGURE 3-164: HOUSE AT 11531 MILL ROAD, NORTHEAST OBLIQUE

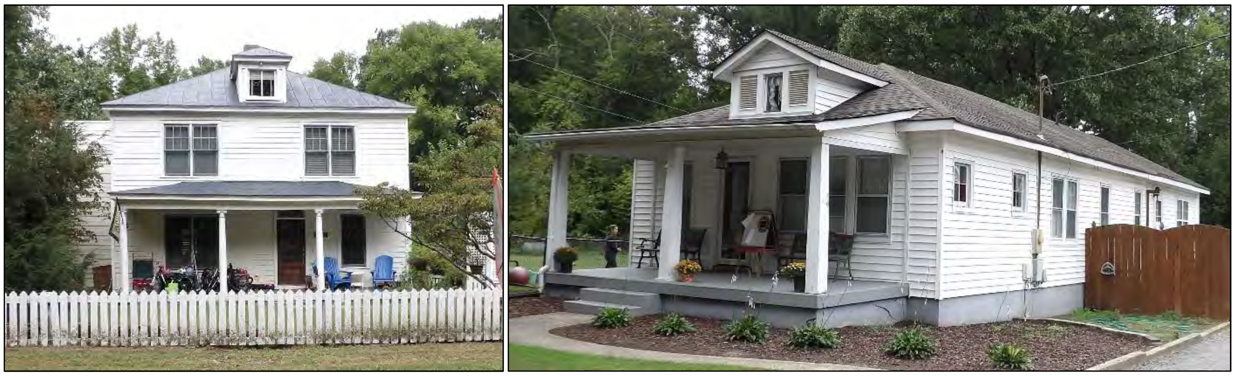

FIGURE 3-165: HOUSE AT 11700 MILL ROAD, SOUTH ELEVATION (LEFT) AND HOUSE AT 11440 MILL ROAD, SOUTHEAST OBLIQUE (RIGHT)

Minimal Traditional examples begin to appear in the district in 1940s and are limited. They are no more than one story in height and are primarily of frame construction (Figure 3-166) (for example, House at 11723 Mill Road). One Minimal Traditional-styled dwelling features characteristics of the Tudor Revival style through a prominent gabled entrance (Figure 3-167).

Common modifications to all dwelling types include small- to large-scale additions and replacement materials including exterior siding, roofing, and fenestration. Late-twentieth-century infill is visible in several areas. Two areas of this development are concentrated in the southwestern tip of the district at Shae Place, Wyatt Farm Drive, and Long Meadow Drive with another at the eastern tip at Hunton Crossing Place.

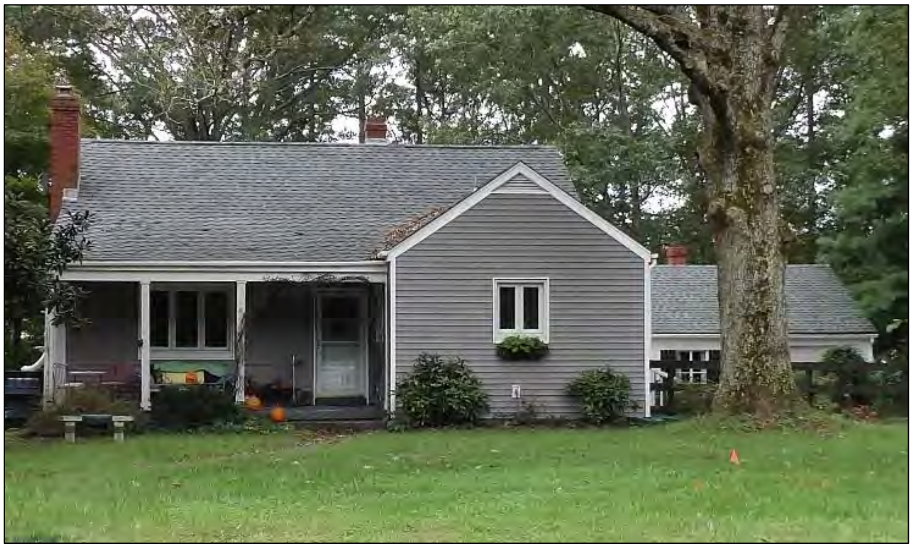

FIGURE 3-166: HOUSE AT 11723 MILL ROAD, NORTH ELEVATION

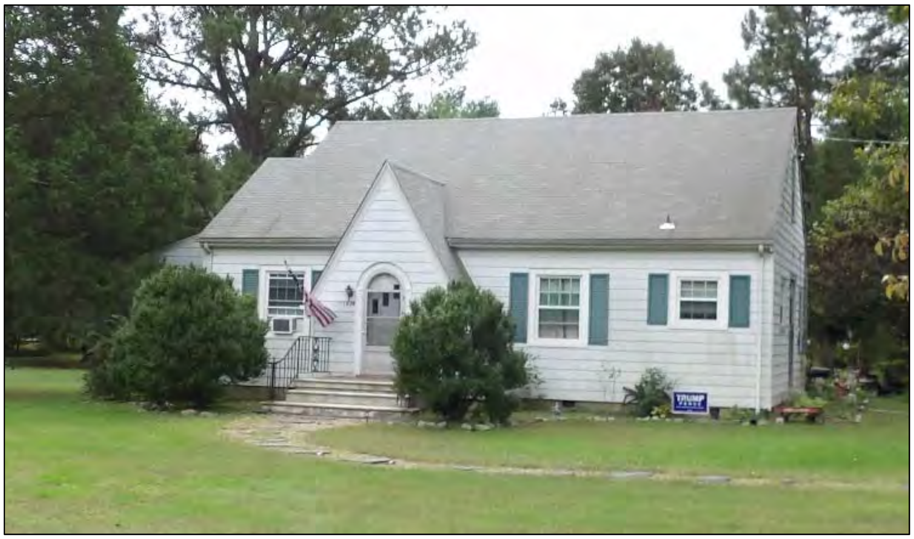

FIGURE 3-167: HOUSE AT 11939 MILL ROAD, NORTH ELEVATION

3.14.3 NRHP Evaluation

The Mill Road Historic District is representative of a rural area of Henrico County that developed slowly beginning around the turn of the twentieth century and has continued to be improved throughout the mid-twentieth century to present day. This area does not retain its rural character due to heavy modern development in the latter part of the twentieth century. This development immediately surrounds the district and negatively affects its historic integrity of setting, feeling, and association. Many of the surviving buildings within the district boundaries have undergone common modifications such as replacement windows and siding as well as the construction of additions, rendering the district with a low to moderate level of integrity of materials, workmanship, and design.

The NPS guidelines for evaluating a district under Criterion A state that it must be associated with one or more events or trends important in a defined historic context (Shrimpton et al. 1990). However, they also state that mere association with historic events or trends is not sufficient for a district to be considered eligible. The Mill Road Historic District highlights a railroad village in Henrico County with primary development occurring during the early-twentieth century, in correlation to the success of commuter rail transportation. However, it was not the only such community in the region and does not retain sufficient integrity to convey its origins. For these reasons, the resource is recommended not eligible for the NRHP under Criterion A. There is not any known association with any significant person or persons from local, regional, or national history; therefore, the resource is recommended not eligible under Criterion B.

According to the guidelines set by the NPS, for a district to be eligible under Criterion C, it must clearly contain enough distinctive characteristics to be considered a true representative of a particular type, period, or method of construction (Shrimpton et al. 1990). Many of the buildings within the district have undergone alterations, while the modern residual subdivisions that are encroaching on the district at the eastern, southern, and western borders has negatively impacted the district's integrity. A similar district, the Laurel Crossroads Historic District (043-0289), is a late-nineteenth-century, railroad crossroads community in Henrico County that has also suffered from an abundance of modern development. This resource was recently determined not eligible by DHR staff due to a loss of contributing historic resources and integrity. Similarly, the DC2RVA teams recommends the Mill Road Historic District not eligible for listing in the NRHP under Criterion C. As an architectural resource, it was not evaluated under Criterion D.

In sum, the Mill Road Historic District is **recommended as not eligible for listing in the NRHP under Criterion A–C.**

3.15 HUNTON TREASURES (043-0694)

The resource recorded as Hunton Treasures at 11701 Greenwood Road is located at the north corner of the intersection at Greenwood Road and Old Washington Highway in a residential area of Henrico County, Virginia (Figure 3-168). The existing CSXT rail line is located west of the parcel. The resource is now used a commercial building with a sign reading "Workshop Gallery," and rests on a small parcel of approximately 4.0 acres primarily covered by a dense forested area on its north side. Immediately surrounding the resource is a mix of gravel and poured concrete. The property is accessed by Old Washington Highway on the southeast side and Greenwood Road on the west side. The primary elevation of the resource faces southeast toward Old Washington Highway.

3.15.1 Historic Context

In 1922, an approximately 344-acre farm "lying near the station of Hunton" was subdivided into a community named "Lake View" (Henrico County Plat Book [HCPB] 12:41). The Highway Realty and Entertainment Company sold a 5.9-acre lot, denoted as Block 14 in an associated plat, to John R. Chiles, and his wife, Lucy (Figure 3-169) (Henrico County Deed Book [HCDB] 221B:251; HCPB 12:41). The Chiles's sold the lot, renamed as Lot No. 3 in an associated plat, to Herman D Melton in 1926 (Figure 3-170) (HCDB 237B:138).

County records from 1926 specify when Herman D. Melton (1892–1973) acquired the parcel, making no mention of any buildings on the property at that time (HCDB 237B:138). Before Melton was a property owner, census records list him as living with his parents at 18 years old in the Brookland Magisterial District of Henrico County and working as a janitor at a local medical college (U.S. Census 1910, 1920). In 1921, he married Julia Louise Price, and together they had four children; Camilla, Herman Jr., Julia "Louise", and Hubert (Figure 3-171) (Virginia Marriages 2014; U.S. Census 1940). By 1930, Herman Melton was listed as working as a medical technician at a local medical college (U.S. Census 1930, 1940).

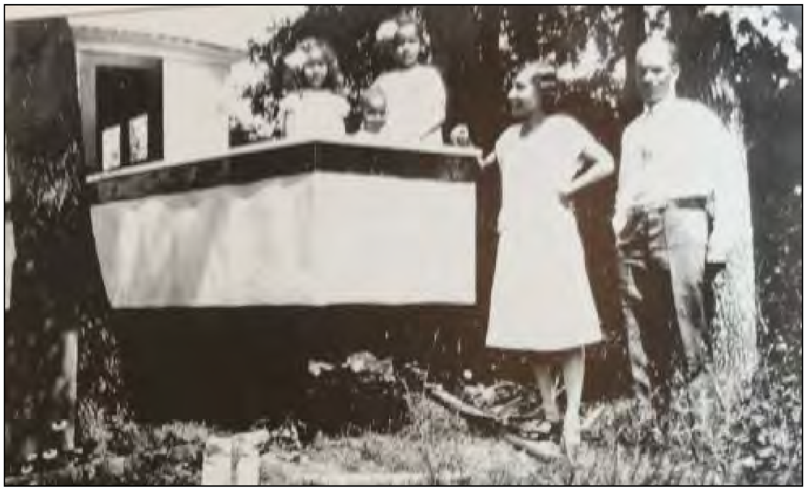

FIGURE 3-171: HERMAN D. MELTON AND WIFE JULIA, WITH THEIR CHILDREN CAMILLA, JULIA "LOUISE," AND HERMAN JR., CIRCA 1935 (MANARIN 2006)

Local tax assessment property cards suggest that the building at 11701 Greenwood Road, originally known as "Hunton Grocery" was constructed sometime between 1930 and 1937, during a time when there was an increase in cars and improved roadways throughout Henrico County (Figure 3-172 and Figure 3-173) (Henrico County Historical Society n.d.). A 1958 road map of Henrico County denotes the resource as "business establishment and filling station"

(Figure 3-174) (Henrico County Historical Society n.d.). The layout and design of the building is indicative of a "multiple use station" of that time as it was "common in rural areas to see gas stations appended to certain structures" such as restaurants, inns, and general stores (Randl 2008). In 1967, a two-story, two-bay addition was added to the northeast side of the building, which totaled $3,750 to construct (Henrico County Tax Assessment Records [HCTAR] n.d.). Although Melton owned the building, it is likely that the grocery store/fueling station was utilized as an investment property as he did not live or work at this location.

In the will of Herman D. Melton dated January 1971, the lot in "Lakeview, 5.08 acres, Lot No. 3, Henrico, Virginia" which contained the building at 11701 Greenwood Road was conveyed to Julia Melton Thornton, his daughter (Henrico County Will Book [HCWB] 57:510). Julia Melton Thornton (1924–2016) was a local school teacher in Henrico County (HCWB 176:309; Virginia Marriage Records 2015; U.S. Census 1940). It is unknown when the building was converted from a fueling station to an antique store known as "Hunton Treasures," but it was sometime during her ownership. The building remained an investment property as Julia neither worked nor lived at this location. She maintained ownership of the property until her death in 2016 when it was willed to her daughter, Laura T. Wesley (HCWB 179:309). Laura currently owns the property, using it as an art workshop and gallery space.

3.15.2 Architectural Description

3.15.2.1 Primary Resource Exterior

The resource at 11701 Greenwood Road, a two-story, three-bay, commercial building, was constructed sometime between 1930 and 1937 as a fueling station and store with attributes from the Spanish Revival/Eclectic style (Figure 3-175 through Figure 3-177). The building is set on a continuous concrete foundation that supports a structural system of parged concrete blocks. Covering the building is a flat roof with a stepped parapet lined in brick (Figure 3-178). An interior-end, parged, chimney pierces the roof on the northwest side. A second interior-end chimney is featured on the southwest side of the roof. This parged chimney is lined in brick, with a terracotta flue extending from its opening.

Entry to the building is gained from the southeast elevation through a single-leaf, half-glazed, metal, replacement door, which is partially covered by metal grating and topped by a rectangular transom. Flanking the entryway are two, two-light, wood-framed, fixed, display windows covered with vertical metal bars. Additional fenestration includes six-over-six, wood-frame, double-hung-sash windows on the second story. Spanning from the southeast elevation and covering the entryway is a one-story, full-width, canopy that features a flat roof with a stepped parapet, mimicking the parapet on the core of the building (Figure 3-179).

The southwest elevation of the building features two, single-leaf entryways, one of which is covered in plywood near the westernmost corner and another that is filled with a single-leaf, paneled replacement door. The northwest elevation of the building featured both four-over-four and six-over-six, double-hung sash windows. A small concrete-block pumphouse is connected to the building and sits to the west of the entryway (Figure 3-180).

A 1967 concrete-block addition extends off of the northeast elevation and features a flat roof with a parapet on its northeast side. An exterior-end, concrete-block chimney is located on its northeast elevation. An entrance at the second story of the northwest elevation is accessed by a set of wooden stairs that span the northeast elevation and wrap around to the northwest elevation (Figure 3-180). A second entrance is located on the first story on its northwest elevation and is filled with a single-leaf door covered in plywood. Additional fenestration on this addition includes three-light, metal-framed, awning-sash windows and two-light, metal-framed, sliding windows covered with vertical, metal bars.

3.15.2.2 Primary Resource Interior

Access to the interior of the building at 11701 Greenwood Road was not granted by the current property owner during this effort.

3.15.2.3 Secondary Resources

A circa-1950, poured-concrete well is located immediately west of the primary resource (Figure 3-181). It is covered by a circular concrete cap and four metal posts visually mark it. A circa-1930, secondary building noted on the tax assessment property card for 11701 Greenwood Road is no longer extant. Foundation remains were not visible during the current effort.

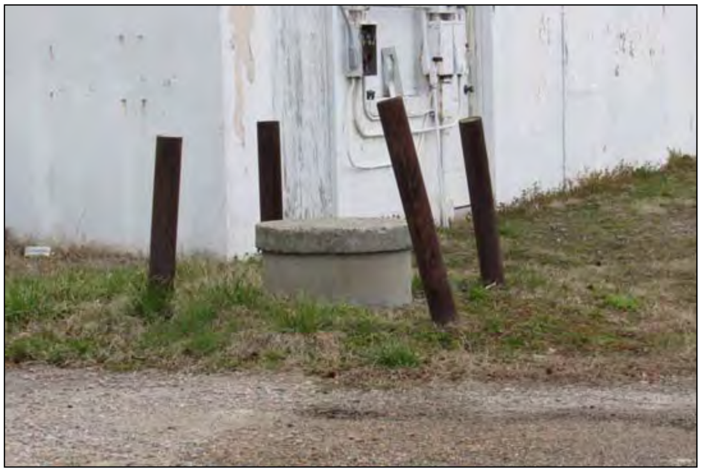

FIGURE 3-181: WELL, LOOKING SOUTHEAST

3.15.3 NRHP Evaluation

The resource at 11701 Greenwood Road, recently known as Hunton Treasures, is a two-story, three-bay, commercial building constructed as a fueling station and convenience store sometime between 1930 and 1937 with Spanish Revival attributes. It was built during a time when there was an increase in the use of cars and developing roadways, and it is the only recorded example of a Spanish Revival commercial building located in Henrico County (Manarin 2006:27; V-CRIS 2018). The resource retains historic integrity of location, setting, feeling, and association. Modifications in the late 1960s, including a two-story addition, have minimally impacted the core of the resource, and as such it retains a relatively high level of integrity of design, materials, and workmanship.

In order for a resource to be considered eligible in the NRHP under Criterion A, "a property can be associated with either (or both) of two types of events… a specific event marking an important moment in American prehistory or history [or] a pattern of events or a historic trend that made a significant contribution to the development of a community, a state, or a nation" (Shrimpton et al. 1990). Although the construction of the commercial building at 11701 Greenwood Road was a part of a larger growth trends regarding the automobile within Henrico County, that in and of itself does not merit eligibility. It also has no association with another notable historic event or trend. As such, it is recommended not eligible for listing in the NRHP under Criterion A.

The building has no known association with any individuals who have "gained importance within his or her group of profession" therefore, the resource is recommended not eligible under Criterion B.

Hunton Treasures has undergone minimal changes over time. An addition was appended to the east elevation; however, the original core of the building remains intact and in excellent condition. The building's character defining elements still collectively reflect the vernacular Spanish Revival style and contrast with the rest of the surrounding community. As a commercial building, the resource follows trends in form and massing as other historic gas stations within the county. Wiltshire Gas Station at 10698 Courtney Road (043-5139), was constructed circa 1920 in the "Bungalow style" and features a one-story hipped roof with a one-story canopy (V-CHRIS 2018). Hunton's Treasurers is an outstanding example of a service station and commercial building constructed in the early-twentieth century with Spanish Revival elements and is the only Spanish Revival-style commercial building recorded in Henrico County. As such, it is recommended that the building at 11701 Greenwood Road is eligible for listing in the NRHP under Criterion C at the local level as an outstanding example of commercial roadside architecture dating from the 1930s. As an architectural resource, it was not evaluated under Criterion D.

In sum, Hunton Treasure's is **recommended eligible under Criterion C at the local level for its unique architecture.**

The period of significance for Hunton Treasures begins at the time of its construction, circa 1930. The DC2RVA Team applied the NPS 50-year rule for defining periods of significance resources "where activities begun historically continued to have importance and no more specific date can be defined to the end of the historic period" (NPS 1997). As such, the period of significance spans from 1930 to 1968. The proposed NRHP boundary for the resource comprises and follows the legal lot description for parcel 772-776-3336 (Figure 3-182). It is bounded on the north by parcel 772-776-3172, on the east by parcel 772-776-6754, on the west by Greenwood Road and Old Washington Highway to the south.

3.16 GILPIN COURT APARTMENT COMPLEX (127-6883)

The Gilpin Court Apartment Complex is located approximately 1 mile north of downtown and the Capitol District of Richmond, Virginia. As documented here, the complex includes the original buildings established in the complex in the 1940s; it does not include the expansion area, built between the 1950s and 1980s. This expansion area has been recorded as a separate resource, the Gilpin Court Apartment Complex Expansion (127-7180). The latter is not included in the current narrative.

The original Gilpin Court complex spans multiple blocks encompassing approximately 12 acres bounded by the CSXT railroad to the north, Chamberlayne Parkway on the west, W. Charity Street on the south, and St. Peter Street on the east (Figure 3-183). Hickory Street subdivides the buildings in a north-south direction and Calhoun Street runs east-west, separating apartment buildings to the south and a concession building and community center to the north. The blocks that contain apartment buildings are sparsely landscaped and contain a few mature trees. Poured-concrete walkways extend from the sidewalks along the street to the individual apartment buildings.

3.16.1 Historic Context

The area in Richmond which the Gilpin Court Apartment Complex was established was once known as "Apostle Town," designated as such for the names of its streets reflecting the "sacred names of the twelve," of the larger area of Jackson Ward (Silver 1984:153). Jackson Ward was a thriving African-American commercial and residential neighborhood with concentrated areas of substandard housing. In the early decades of the twentieth century, racial tensions were high in Richmond and a segregation ordinance was adopted in 1915 in an attempt to separate housing and commerce by race and income level, which virtually correlated during this period (Silver 1984:111). Proponents of this "racial zoning" argued that it would stabilize property values and reverse abnormal trends in land uses (Silver 1984:111). Although the United States Supreme Court declared residential segregation ordinances unconstitutional in *Buchanan v. Warley* (1917), Richmond continued in its efforts of applying zoning to the "race problem" but by the late 1920s, several federal circuit court appeals permanently erased racial zoning in Richmond (Silver 1984:112). However, the practice of segregating neighborhoods did not cease where owners and real estate interests turned to private deed covenants to restrict buyers (Silver 1984:112–113).

Occurring concurrently with segregation issues in Richmond was widespread unemployment and economic instability brought on by the Great Depression. A shortage of private, affordable housing across the nation provoked President Franklin D. Roosevelt's New Deal (1933–1937) which promised "economic relief, recovery, and reform" for public housing and a proactive approach to plan for urban growth (Germer 2015). Stemming from the New Deal and the United States Housing Act of 1937 was the United States Housing Authority (USHA), who would "provide long-term interest-free loans to newly created regional public housing authorities (PHAs)" to develop, acquire, and manage low-income housing and slum clearance projects with the vision of "public housing to be locally funded and regulated" (Germer 2015; Shumsky 1998:851–852). Site selection for future public housing projects was heavily weighted to areas that were considered "slums" or blighted, and the housing authorities would utilize eminent domain to clear the land and construct public housing (Germer 2015).

Although states enacted legislation to set up regional housing authorities, Richmond did not seek any government relief throughout a majority of the 1930s and would only accept funding through a public-private partnership with an emphasis on local private leadership (Germer 2015; Silver 1984:131). Around 1933, the Sunshine Housing Corporation was formed at the urging of the Richmond Chamber of Commerce (Germer 2015). It was composed of white philanthropists and businessmen with the intent to "conceive of a slum clearance plan to renew a blighted part of downtown" and obtain a federal loan for construction of approximately 228 apartments (Germer 2015; Silver 1984:131). The area chosen for their first major urban renewal project was a small section comprising 150 parcels adjacent to the central Jackson Ward neighborhood, bounded by Chamberlyne Avenue and Baker, St. Peters, and Fendall streets. This selection greatly upset the local community by excluding them from the decision process, "creating an imbalance of power between white and black city residents" (Figure 3-184) (Germer 2015). However, funding in the construction sector fell through as effects of the Great Depression continued and the first housing project planned by the Sunshine Housing Corporation was never realized.

FIGURE 3-184: 1925 SANBORN FIRE AND INSURANCE MAP OF THE AREA CHOSEN FOR SLUM CLEARANCE BY THE SUNSHINE HOUSING CORPORATION'S FIRST URBAN RENEWAL PROJECT (SANBORN MAP COMPANY 1925). NOTE THE "COLORED" SPECIFIC RELIGIOUS AND RECREATIONAL BUILDINGS. (NOT TO SCALE)

As the economy began to stabilize and a new mayor was elected into office in 1940, a renewed and more vigorous interest in progressive urban planning and affordable public housing in Richmond was spurred (Germer 2015; Silver 1984:150–151). A regional housing authority, the Richmond Redevelopment and Housing Authority (RRHA), was established, and by 1941, "the city had secured a promise from the USHA for $3,191,000 to launch its first slum clearance and public housing project" (Silver 1984:150–151). The site for the first public housing project encompassed eight city blocks in the area originally chosen by the Sunshine Housing Corporation. Clearance proceeded fairly quickly with the demolition of nearly 200 "ramshackle" structures and the construction of a 297-unit complex known as Gilpin Court (Silver 1984:153). Named after Charles Sydney Gilpin, a popular African-American stage actor of the 1920s who hailed from Jackson Ward, Gilpin Court was advertised as a "Model Negro Apartment" that would house up to 301 families (Figure 3-185) (Germer 2015; Holmberg 2017; RRHA 1941). The complex, set on several abnormally shaped blocks between Chamberlayne Avenue, Calhoun Street, Charity Street, and St. Peter Street, is noted in the 1950 Sanborn Fire and Insurance Map to contain 17 apartment buildings of steel-frame construction with brick-faced walls, a central heating plant building, and an office building (Figure 3-186 through Figure 3-188) (Sanborn Map Company 1950).

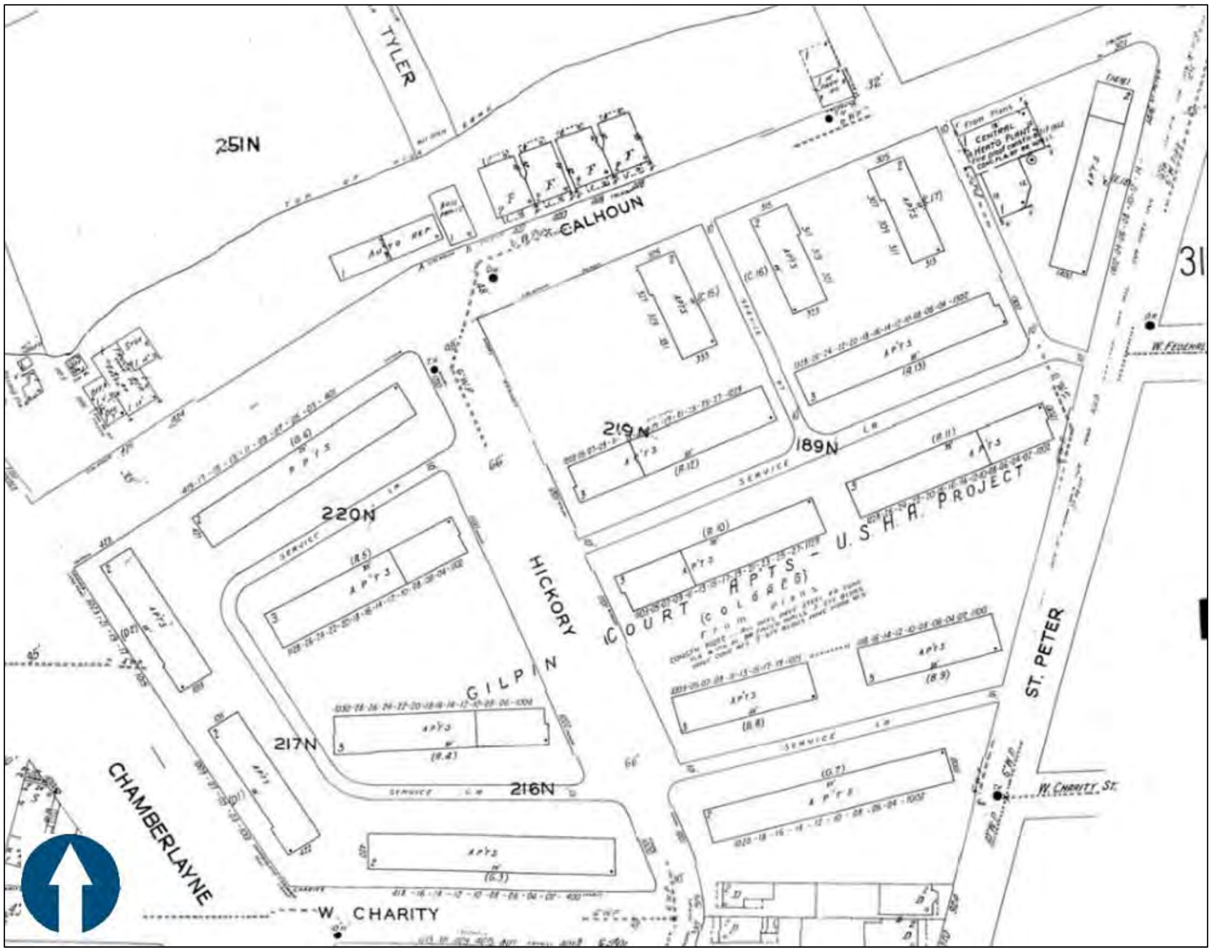

FIGURE 3-188: 1950 SANBORN FIRE AND INSURANCE MAP (SANBORN MAP COMPANY 1950) (NOT TO SCALE)

Construction was momentarily halted by the shortage of building materials due to World War II and it only resumed after RRHA "aligned Gilpin's development with the war effort by preferencing war workers over other applicants" (Germer 2015). The complex, composed of mainly one- to two-room apartment units, set varying rental prices for war workers versus "the low income non-war worker" group, with slightly higher rents for war workers who were estimated to earn slightly higher annual incomes than low-income, non-war workers (Germer 2015). As Yale National Fellow, Libby Germer (2015) states in her seminar entitled *A Public History of Public Housing: Richmond, Virginia*:

> The decision to offer shelter in Gilpin Court, sitting on top of the demolished homes of displaced black people, to the families of workers moving into the city to work in war-related industries reflects specific war time realities of scarcity and tight budgets. However, it seems an inauspicious beginning for the RRHA, whose very existence was born out of the pressing need for better living conditions of the black people in downtown Richmond.

The Gilpin Court Apartment Complex officially opened in 1943 and afforded minimal-maintenance housing with simple aesthetics for low-income citizens; however, after 1945 when World War II and the associated war-worker requirements ended, many were too poor to qualify for public housing and the program could do little to "tackle the full range of housing and community revitalization needs" (Silver 1984:153–155). Nevertheless, several other public housing complexes were constructed such as Creighton and Hillside Courts, and Gilpin Court was expanded several times in the following three decades. As Gilpin Court was revered at the time of its construction, its amenities fell short of later public housing models in Richmond. Creighton and Hillside Courts, both constructed in the 1950s, reflected the contemporary projects in New York, Chicago, and St. Louis in terms of amenities and pricing, yet contrasted in architectural size and scale as they were low-rise buildings constructed on smaller parcels (Germer 2015).

Gilpin Court is still in use as a public housing facility today along with five others in Richmond: Hillside, Creighton, Fairfield, Whitcolm, and Mosby, where the average occupancy is 8.5 years and annual income is less than $9,000 (Germer 2015). Since initial construction, the Gilpin Court Apartment Complex has grown notably to the south and east and includes more multi-family dwellings, recreational areas, and a large apartment tower. This expansion (Gilpin Court Apartment Complex Expansion [127-7180]) occurred from the 1950s to the 1980s.

3.16.2 Architectural Description

3.16.2.1 Primary Resource Exterior

The Gilpin Court Apartment Complex is the original 1942 core of a housing complex constructed by the RRHA as subsidized, public housing. This complex comprises 18 apartment buildings, a community center with sports fields and basketball courts, a central heating plant, and an annex building (Figure 3-189).

The grouping of 18 apartment buildings is situated on the southern half of the resource. The 1950 Sanborn map of Richmond states that "all apartments have steel frame, concrete floors, and cinder-block brick-faced walls. Three-story buildings have concrete roofs, and the two-story buildings have wood roofs" (Sanborn Map Company 1950). Currently, all buildings have a structural system clad in a brick, stretcher-bond veneer, some of which feature decorative belting between the first and second stories (Figure 3-190Figure). The buildings that line W. Charity Street, Calhoun Street, and Chamberlayne Parkway are covered by hipped roofs, while the buildings located within the block's interior (on Hickory Street) have side-gabled roofs (Figure 3-191). Fenestration includes single-leaf doors—one for each unit—and a wide variety of windows, including wood-frame, one-over-one and six-over-six units, and one-over-one, vinyl, replacement sashes. While a majority of the entrances do not have any porch or stoop, some are covered by a hipped-roof, gabled, or shed-roof entry porch, while others have just a poured-concrete stoop lined with a metal handrail (Figure 3-192).

3.16.2.2 Primary Resource Interior

Access to the interior of the buildings in the Gilpin Court Apartment Complex was unattainable during the current effort.

3.16.2.3 Secondary Resources

A circa-1990, one-story, multi-bay, community center is situated approximately 150 feet south of the railroad at the northeast side of the intersection at Calhoun Street and Chamberlayne Parkway (Figure 3-193). The foundation and structural system are clad in brick veneer. Covering the building is a flat roof. A one-story, full-width, shed-roof additions clad in standing-seam metal span the east and west elevations. A large hipped-roof addition spans the west wide of the south elevation and is clad in standing-seam metal. A one-story, two-bay, cross-gabled entryway is situated on the center of the south elevation. Entry is accessible through two, double-leaf, glass-and-metal, commercial-style doors. A circa-1942, annex building possibly used as a concession building is located north of Calhoun Street, immediately southeast of the circa-1980 basketball court (Figure 3-194). Its foundation and structural system are clad in brick. Covering the building is a T-shaped gable-roof, with a hipped end on its north side. The roof is clad in standing seam metal.

A heating plant or power building, built circa 1942 in no discernible style, is located on the south side of Calhoun Street on the northeast block of Calhoun Street and St. Peter Street (Figure 3-195). The one-story, four-bay, rectangular building sits on a continuous, masonry block foundation that supports a structural system clad in brick veneer. It is covered by a flat, asphalt roof that features two large metal flues. A large brick smokestack is situated at the corner of the southeast oblique. A basketball court and a metal playground structure, added around 1980 and 1990 respectively, are situated approximately 150-feet south of the railroad, and 180-feet east of the circa-1990 community center, on the north side of Calhoun Street.

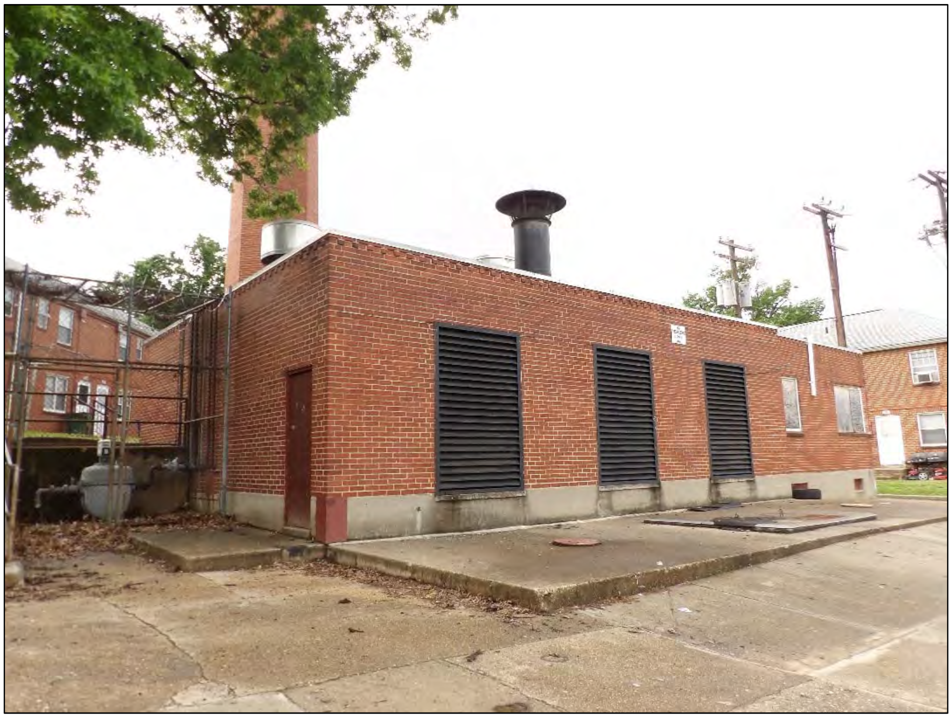

FIGURE 3-195: GILPIN COURT APARTMENT COMPLEX, CENTRAL HEATING PLANT, LOOKING SOUTH

3.16.3 NRHP Evaluation

The Gilpin Court Apartment Complex consists of 21 buildings, including 18 apartment buildings, a community center, a central heating plant, and a concession building. The complex was constructed in the early 1940s by the RRHA and is the first public housing complex constructed in Richmond. Although plans initially called for the complex to be used as low-income-based housing, primarily for Richmond's African American residents, construction of the complex was only continued as a result of need for World War II-worker housing with the understanding that the buildings would revert back to primarily low-income public housing after the war. The resource retains high level of integrity of location, association, feeling, and setting as it remains a public housing complex. Several modifications to the buildings have been noted such as replacement fenestration and roofing materials, negatively affecting the resource's historic integrity of materials, design, and workmanship.

NPS guidelines state that in order for a resource to be eligible for listing in the NRHP under Criterion A, it must be associated with a historic event or trend that "must clearly be important within the associated context" and "the property must have an important association with the event or historic trends, and it must retain historic integrity" (Shrimpton et al. 1990:12–13). The Gilpin Court Apartment Complex is the first public housing complex constructed in Richmond, built by the RRHA and funded by the USHA. The development of this resource reflects national trends to create housing for low-income residents and remove "blighted" neighborhoods after the tumultuous years of the Great Depression. The resource currently remains in use as a low-income, public-housing complex. For these reasons, the resource is recommended as eligible under Criterion A at the local level for its association with the public housing movement in Richmond set forth by the New Deal and USHA in the 1940s, for providing affordable housing for Richmond's war workers during the Second World War, and for its association to the African-American community in Jackson Ward.

In order for a resource to be considered NRHP-eligible under Criterion B, it must be associated with "individuals whose specific contributions to history… whose activities are demonstrably important within a local, State, or national historic context" (Shrimpton et al. 1990). The complex was constructed through initiatives taken by the RRHA, a local public housing authority established by the Commonwealth in accordance with USHA guidelines and funding. No individuals were identified as being instrumental in this effort or earned great acclaim because of their role in this development. Therefore, the Gilpin Court Apartment Complex is recommended as not eligible under Criterion B.

The Gilpin Court Apartment Complex is the first of a series of public housing complexes constructed in Richmond for low-income and African-American residents that continues to be used to this day. Despite constant use for over 60 years, it has remained intact with very limited modifications made to the buildings and the retention of its original layout. Other examples of this resource type are found in Richmond such as Creighton Court Public Housing Facility (127-6684), Mosby Court, and Fairfield Court; however, Gilpin Court is the first constructed and the only complex from the early efforts of the public housing movement in Richmond. The buildings are an excellent example of the architecture used on large-scale, low-income residences, including limited but tasteful exterior styling and a plan that includes not only residential structures but also recreational facilities for the residents. These secondary resources also retain their historic and physical integrity. For these reasons, the resource is recommended eligible for listing in the NRHP under Criterion C at the local level for its representation of a federally funded public housing complex in the City of Richmond. As an architectural resource, it was not evaluated under Criterion D.

In sum, the Gilpin Court Apartment Complex (127-6883) is recommended as **eligible for listing in the NRHP under Criterion A at the local level for its association with Richmond's social**

history, ethnic heritage, and development as well as Criterion C at the local level as the first example of a federally funded public housing complex in the city.

The proposed period of significance of the Gilpin Court Apartment Complex begins 1942, when the resource was construction and opened to perspective residents, and ends in 1955, when the apartment complex was expanded. The proposed NRHP boundaries for the resource encompasses the buildings constructed as part of the original complex beginning at the intersection of Chamberlayne Parkway and W. Charity Street then following W. Charity Street east and turning north at the intersection with St. Peter Street. Continuing north on St. Peter Street, the boundary turns west at the intersection with current rail line and continues west towards Chamberlayne Avenue. It then turns south back to the beginning (Figure 3-196).

3.17 LOVING'S PRODUCE COMPANY (127-0344-0102)

Loving's Produce Co. is situated at the south corner of the intersection at E. Grace Street and Ambler Street, currently standing unoccupied on the south side of the CSXT railroad within Richmond, Virginia (Figure 3-197). The commercial building, sitting close to the roadway on approximately 0.18-acre parcel, is primarily surrounded by an empty gravel lot on its southwest and southeast sides. Poured-concrete sidewalks are flush with the building along its northwest and northeast sides. Despite the E. Grace Street address, the primary elevation of this building faces Ambler Street. The surrounding area is a mix of commercial, industrial, and residential buildings.

3.18.1 Historic Context

The commercial building at 1601-1605 E. Grace Street, locally known as Loving's Produce Co., is situated in the heart of Shockoe Valley and Tobacco Row Historic District (127-0344) in Richmond. The district includes Richmond's earliest residential, commercial, and manufacturing activity (V-CRIS 2018).

The building was constructed circa 1870 and began as a three-story, two-bay, commercial building that operated as a furniture and cabinet-making shop, with an attached two-story "shop" on its southwest side as shown in the 1886 Sanborn Map (Figure 3-198) (Sanborn Map Company 1886b). The parcel was conveyed to William H. Scott in a series of three deeds, dating to 1872, 1875, and 1896, from William Tyree, A.D. Williams, and T.C. Woody (City of Richmond Deed Book [CRDB] 99C:78, 105A:72, 157B:384). William Tyree is listed as paying property tax for the parcel at the corner of Union Street (now Ambler Street) and Grace Street from 1872 to 1886 when William H. Scott is noted as taking over these payments (Figure 3-199).

William H. Scott (1838–1909) was a wealthy Shockoe Valley druggist and businessman who owned a number of properties in this part of town in the late-nineteenth century (U.S. Census 1870). Prior to his ownership of the building on E. Grace Street, Scott prospered during the Civil War when he was appointed as an interim Councilman of the Clay Ward by Governor Walker in March 1870 (Chesson 1981:239).

FIGURE 3-199: 1886 CITY OF RICHMOND LAND TAX, JEFFERSON WARD (CITY OF RICHMOND LAND TAX BOOK 1886)

By 1895, the building that housed the original furniture and cabinet making shop was converted into a meatpacking and cold storage company owned by "Armour and Co." and the two-story "shop" was converted to a three-story building equipped with a smokehouse. It is unclear whether Scott was a member of Armour and Co., however, it is likely that he owned the buildings and leased it as investment property. Two one-story dwellings were attached on the southwest side of the three-story Armour and Co. building (Sanborn Map Company 1895).

In 1905, the two one-story dwellings were converted into a single, three-story addition, that was used as storage on the first and third floors, offices on the second floor, and a salt cellar at the basement level (Figure 3-200) (Sanborn Map Company 1905). The southwest side of the building was lined with a one-story "stove," and the rest of the block is filled with a series of one- and two-story commercial buildings. This final 1905 alteration makes complete the three-story, eight-bay, commercial building that currently stands today, and this series of additions is visible in the roofline of the building on aerial imagery.

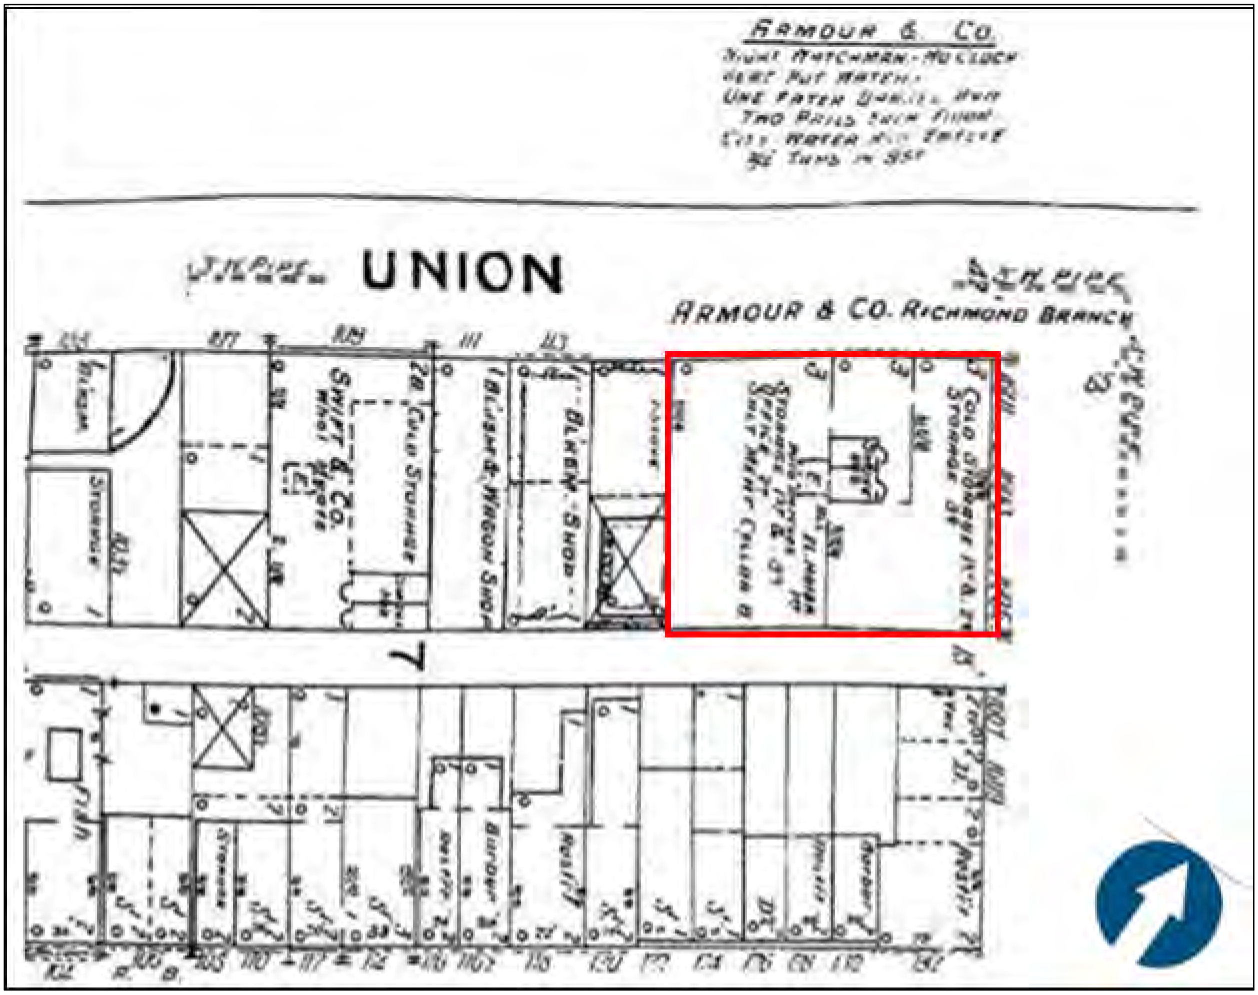

FIGURE 3-200: 1905 SANBORN MAP OF BUILDINGS ON E. GRACE STREET AND UNION STREET (SANBORN MAP COMPANY 1905) (NOT TO SCALE)

William H. Scott owned the property at 1601–1605 E. Grace Street until his death in 1909 when the building was conveyed to his son and daughter, John G. Scott and Emma G. Scott Taylor, who received equal shares of the real estate from his will (City of Richmond Will Book [CRWB] 10:616). The resource continued to be utilized as a meatpacking company, now "Morris and Co." (a company owned by "Armour and Co."), until 1924 when the building was noted as being converted into a wholesale grocer (Figure 3-201) (Sanborn Map Company 1950). In 1956, Emma Scott Taylor and John G. Scott created, and incorporated, the "William H., John G., Emma Scott Foundation," an organization that currently donates to "support programs which alleviate human suffering, and improve the health of those families, individuals, and children in need of aid and/or education" (Foundation Directory Online 2018).

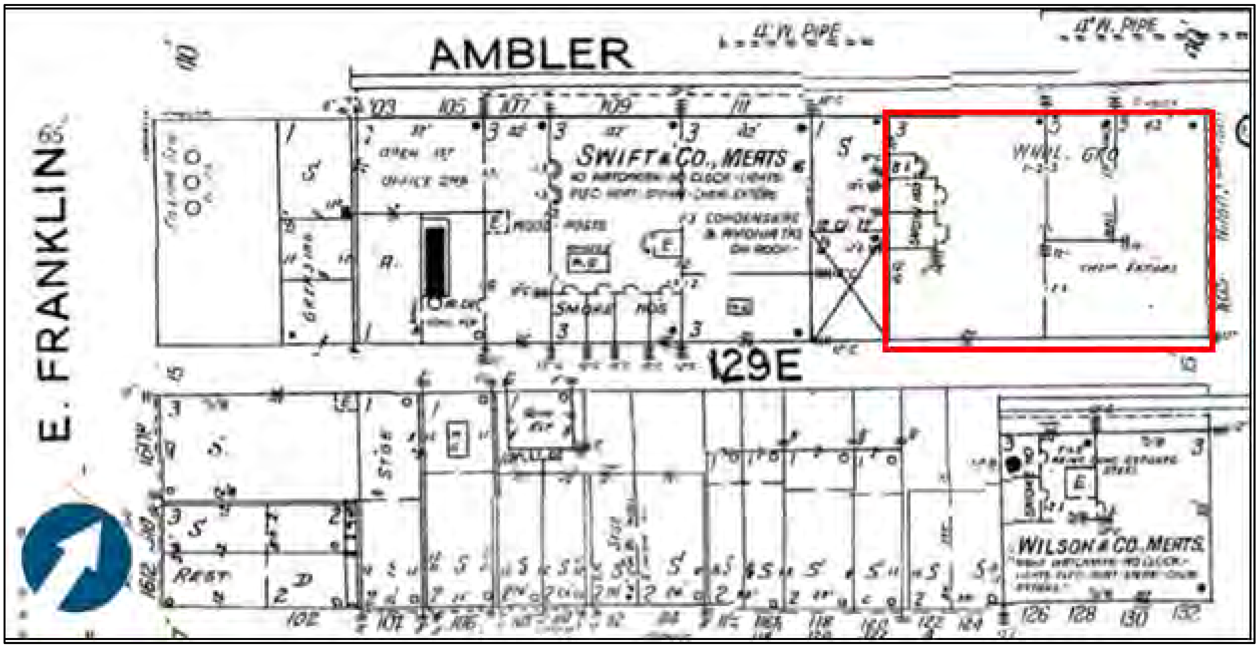

FIGURE 3-201: 1950 SANBORN MAP OF BUILDINGS ON E. GRACE STREET AND UNION STREET (SANBORN MAP COMPANY 1950) (NOT TO SCALE)

In 1961, the William H., John G. Emma Scott Foundation, conveyed to Harry W. Loving, "all of the real estate deeded to William H. Scott by three deeds" which was "devised to John G. Scoot and Emma Scott Taylor in equal shares" and later inherited "by the William H., John G., and Emma Scott Foundation" (CRDB 605C:452).

Harry Weston Loving was a grocer, and founder and president of Loving's Produce Company, a family grocery business that had occupied the building at 1601–1605 E. Grace Street since the late 1940s (The Packer 2011). Although Mr. Loving was not the owner of the building until 1961, it is likely that it was leased while growing his family-owned business at that location.

Henry Loving was born in 1914 in Hanover, Virginia (Virginia Marriage Records 2015). Before becoming a business owner, he was a proprietor of an auto repair shop and served as a Private in the U.S. Army during World War II (US Army Enlistment Records 2005; U.S. Census 1940). After the war, Loving founded his family grocery store that remained a thriving business for nearly 60 years (The Packer 2011). "Loving had worked as president of the company until [2002], when he formally retired and gave control of Loving's Produce [Harry and Betty Loving LLC] to two of his sons, Gary and John Loving" (The Packer 2011). Henry Loving passed away in 2004 at age 89 (Virginia Death Records 2015). Currently, the building stands unoccupied and is owned by Harry and Betty Loving LLC with co-owners Wright Dunn LLC.

3.18.2 Architectural Description

3.18.2.1 Primary Resource Exterior

The commercial building at 1601–1605 E. Grace Street, locally known as Loving's Produce Co., is a three-story, eight-bay, commercial building constructed around 1870 with Italianate-style elements (Figure 3-202). Aerial imagery of the roof line, coupled with door arrangements and changes in brick along the façade, suggest that the building was originally constructed in a rowhouse plan rather than a single building (Google 2018; Sanborn Map Company 1886b, 1895, 1905, 1950). The continuous concrete foundation supports a structural system that is clad in a five-to-one brick bond. The first story of the northwest elevation has been altered with a modern, five-to-one bond, brick veneer, and a cornice is missing above the first-story openings. Covering the building is a flat roof and a wooden parapet at the northwest elevation that features a bracketed cornice with dentils. The rear (southeast) elevation features an asymmetrical parapet lined with metal coping. A large, interior-end, brick chimney pierces the roof on the southwest side. A smaller brick chimney sits directly in front of the larger chimney on its northwest side (Figure 3-203).

There are four, recessed, double-leaf, six-light, wood paneled delivery entrances along the first story of the northwest (primary) elevation, each topped with a 12-light transom covered with vertical metal bars. A secondary entrance is located at the north bay of the northeast elevation. It is filled with a single-leaf, metal door and topped by a 12-light transom covered with metal security bars. A full-length, side-light sits immediately southeast of the single-leaf door. Above the entryway is a missing cornice. Additional fenestration includes a mix of six-over-six, double-hung, wooden windows topped by segmental brick arches and ghosts of windows filled in with brick. The windows on the first story of the southeast elevation are covered with metal security bars.

A sign that reads "Loving's Produce Co." is featured on the second story at the north corner of the building (Figure 3-204). Metal tie-rods and anchor plates span all four elevations, below second and third story windows (Figure 3-205).

Signs reading "Loving's Produce Co. Fresh Fruits and Vegetables" are painted on the north side of the northeast elevation, and the east and south sides of the southeast elevation (Figure 3-206).

Ghosting is seen along the southwest elevation where a one-story dwelling was attached as seen in the 1950 Sanborn map of Richmond (Figure 3-207) (Sanborn Map Company 1950). All door and window openings on this elevation have been filled in with brick.

3.18.2.2 Primary Resource Interior

Access to the interior of the building was not obtained during the current effort.

3.18.3 NRHP Evaluation

The commercial building known as Loving's Produce Co., is a three-story commercial building constructed around 1870 with Italianate-style elements. The Shockoe Valley Historic District is noted as an area of commercial and industrial importance before and after the Civil War. It is recognized as a historically significant part of Richmond in its 1982 National Register nomination:

> Although leveled by the Evacuation Fire of April 1865 and rebuilt soon thereafter, the district has served as the site of warehouses, tobacco storage buildings, and mills since 1780… the numerous, well-preserved, late 19th- century commercial and industrial buildings, while individually simple in design, achieve an intricate pattern and texture… The largest single building campaign in Shockoe Slip in the postbellum era took place in 1870s and reflected Richmond's determination to return to the American economic mainstream (NPS 1982).

Loving's Produce Co. has continually served as commercial space since its construction. The resource retains historic integrity of location, setting, and some integrity of feeling and association; however, modifications including late-nineteenth-century additions, late-twentieth-century infill of fenestration, and an altered brick veneer on the façade, have diminished its integrity of design, materials, and workmanship. It was built during a period of tremendous regrowth in Richmond, when the industrial and commercial core of what is today the Shockoe Valley and Tobacco Row Historic District was rebuilt after Civil War-era devastation. This resource is one of the earliest, and few surviving, examples of immediate post-war reconstruction in this area. It represents efforts by residents to reclaim their city by establishing new businesses and reconstructing warehouses to provide goods and employment to the area and is notable for its associations with the rebuilding of Shockoe Bottom. While numerous buildings were constructed in this area as part of this effort, most are gone. This is one of the sole representatives of one of the most notable periods of development in Richmond's history. For these reasons, this resource is recommended eligible for inclusion in the NRHP under Criterion A at the local level.

For a historic resource to be considered eligible under Criterion B, it must be associated with a person who is "individually significant within a historic context" and who has "gained importance within his or her profession or group" (Shrimpton et al. 1990). While the Loving name has been prominent within the Shockoe Bottom community for generations, the family does not appear to have attained significance in their own right, nor have they been associated with events that have made a significant contribution to broad patterns in American history, thus the resource is recommended not eligible for inclusion in the NRHP under Criterion B.

Though the building is in generally good condition, it is one of 34 Italianate commercial buildings within the Shockoe Valley and Tobacco Row Historic District and it is not unique to Richmond as a whole (NPS 2015). Additionally, it is not the work of a master nor does it possess high artistic values, nor is it an outstanding example of its style or property type (Shrimpton et al. 1990). For these reasons, the resource is recommended not eligible for the NPHP under Criterion C. As an architectural resource, it was not evaluated under Criterion D.

Loving's Produce Co. is located within the NRHP-listed Shockoe Valley and Tobacco Row Historic District (127-0344). It was built during the district's period of significance (ca. 1870–1950) and represents architectural trends throughout the community. Although it is not recommended individually eligible for the NRHP under any Criteria, the resource retains good integrity and is recommended to contribute to the eligibility of the Shockoe Valley and Tobacco Row Historic District.

In sum, Loving's Produce is **recommended eligible under Criterion A at the local level as well as considered a contributing resource to the** Shockoe Valley and Tobacco Row Historic District (127-0344)**.**

The period of significance for Loving's Produce begins at the time of its construction, circa 1870, and ends at the culmination of the postbellum-era building campaign in Shockoe Slip at circa 1879. The proposed NRHP boundary for the resource comprises and follows the legal lot description for parcel E0000129029 (Figure 3-208). It is bounded on the southwest side by parcel E0000129022, on the southeast side by parcel E0000129003, on the northwest side by Ambler Street and East Grace Street to the northeast.

3.18 PHILIP MORRIS OPERATIONS COMPLEX (127-5818)

The Philip Morris Operations Complex at 3601 E. Commerce Road is a light industrial complex processing tobacco for the Philip Morris USA company, now the Altria Group (Figure 3-209). The large complex is located on an approximately 142.9-acre lot bounded by E. Commerce Road and the Richmond-Petersburg Turnpike (Route 69) to the east, Bells Road and Philip Morris Drive Way to the west, Philip Morris Drive Way and a residential neighborhood to the north, and other light industrial properties to the south. The property is filled with multiple office buildings and warehouses with a manicured lawn spotted with trees and shrubbery in the northeast corner of the property along E. Commerce Road. Strips of manicured grass stretch between most of the buildings, some also filled with trees. Poured-concrete walkways and paved-asphalt driveways connect all of the buildings on the property. The property, which is fenced in, is accessed from Bells Road via Philip Morris Drive Way and E. Commerce Road by gated vehicular entrances.

3.16.1 Historic Context

The Philip Morris Complex is situated on the east side of the CSXT railroad south of the Capitol District in Richmond, Virginia. Philip Morris USA is one of the world's leading tobacco manufacturing companies with origins tracing back to the late-nineteenth century. "Philip Morris & Co., Ltd. was established in 1847 when the family of Philip Morris opened their first London tobacco shop and began making tobacco products that royalty and the working man alike would enjoy" (Altria 2018a). By the early 1920s, the Philip Morris Company had planted its roots in Richmond, Virginia, as many of its production warehouses were located within Richmond's Shockoe Bottom and Tobacco Row Historic District (127-0344) (Altria 2018b; V-CRIS 2018). By the 1950s, production had moved further from the city's core to an independent location outside of downtown.

The primary resource at the new location is the most visible, a cigarette manufacturing plant finally completed in 1974 after several stages of construction between 1959–1973, which was dedicated to the employees of the company (Figure 3-210) (The News Leader 1974). "The newest manufacturing complex joins other distinguished Philip Morris Buildings on the site, including the Finance Building designed by the noted American architect Ulrich Franzen in 1963, and the Research Center Tower [also designed by Franzen] completed in 1973" (The News Leader 1974). Additionally, one of the notable, Brutalist-style, buildings on the Philip Morris property, an office building and conference center, was designed by Skidmore, Owings & Merrill (SOM), a New York-based company founded in 1936, and one of the largest and most influential architecture, engineering, and urban planning firms in the world (SOM 2018; The News Leader 1974).

NEW PHILIP MORRIS facility in Richmond, the world's most highly automated cigarette manufacturing plant, operates on three shifts and currently manufactures more than 200 million cigarettes a day. It will reach a capability of 140 billion units a year in 1977.

FIGURE 3-210: PHILIP MORRIS COMPLEX DEDICATION (THE NEWS LEADER 1974)

The buildings designed by Ulrich Franzen and SOM at the Philip Morris Complex display unique characteristics in both the Neo-Expressionist and Brutalist styles. The Research Center and Office Building/Conference Center display extensive use of concrete with minimal fenestration, with "windows treated as penetrations in massive forms" (Bezirdjian et al. 2014). The Finance Building, designed by Ulrich Franzen, is an exceptional display of Neo-Expressionism styling, avoiding angles and straight lines and "focusing on the continuity of form, curved lines, and dramatic, irregular shapes" (Bezirdjian et al. 2014). These post-war and post-modern architectural styles were "an attempt to make functional, forceful buildings that were integrated into their surroundings and endowed with the seductive powerful clarity of modern industrial design and advertising" and utilized materials such as "glass, brick, and concrete for their expressive qualities" (Dempsey 2002).

Ulrich Franzen (1921–2012) was a German-born American known for his new-age architecture and Brutalist Style (Gonzales 2012; Harvard University Library 2000). Franzen was born in Dusseldorf Germany and immigrated to the United States with his parents in 1936 (Marter 2011:268). He attended Williams College, receiving an undergraduate degree before joining the Army during the start of World War II (United States Army Enlistment Records 2005). At the end of the war, Franzen attended Harvard University, earning a master's degree in architecture in 1950 (Harvard University Library 2000). By 1951, he was working for I. M. Pei, the renowned Chinese-American architect who designed buildings all over the globe (Harvard University Library 2000). Four years later, Franzen had established his own firm, Ulrich Franzen & Associates (Marter 2011:268). His architectural training and experience was shaped by modernism, and in the 1960s he "began to shift from modernist minimalism to designs that were more sculptural" (Marter 2011:268).

From 1955 to 1995, Ulrich Franzen completed over 60 projects “including private residences, educational structures (notably projects at Cornell University: MVR Hall, the Growth Chamber Laboratories and the Agronomy Building), commercial and industrial commissions (The Philip Morris Research Center and Headquarters at 42nd Street and Park Avenue in New York), and cultural sites ranging from Houston's Alley Theater to the Harlem School of Arts” (Figure 3-211) (Harvard University Library 2000). Franzen had a continuing relationship with the Philip Morris Corporation from the late 1950s to the early 1980s, “designing their Research Center, and Finance Center, all in Richmond, and their headquarters building in New York City” (Marter 2011:268).

FIGURE 3-211: ARCHITECT ULRICH FRANZEN, OUTSIDE THE ALLEY THEATRE, NOVEMBER 1968 (GONZALES 2012)

3.16.2 Architectural Description

The Philip Morris Operations Complex located at 3601 Commerce Road is a light industrial complex utilized by Philip Morris USA Company for tobacco processing constructed between 1950 and 1980 (Figure 3-212). The complex comprises multiple warehouses, office buildings, industrial structures, and manufacturing equipment for the processing of tobacco products. Construction of the complex began around 1950 and was completed in the early 1980s. Full access to the property was not obtained during the current survey, and the property was documented from the public right-of-way.

The 1963 seven-story, Neo-Expressionism-style Finance Building designed by Ulrich Franzen, is located in the southeast portion of the property along Commerce Road and faces north towards a paved parking lot (Figure 3-213). The building is clad in brick veneer and features four evenly spaced, curved projections, a design which suggestively resembles cigarettes, on the north and south elevations. The first story is recessed and features a series of full-length, metal-frame, fixed windows dotted with single- and double-leaf, commercial-style doors. The east and west elevations feature a protruding window feature that spans the uppermost six stories.

FIGURE 3-212: OVERVIEW SITE PLAN (TOP) AND DETAIL OF SOUTHERN HALF (BOTTOM) OF THE PHILIP MORRIS OPERATIONS COMPLEX (GOOGLE 2018) (NOT TO SCALE)

A circa-1973 two-story, Brutalist-style office building and conference center designed by Skidmore, Owings & Merrill features five evenly spaced, four-story towers along the east and west elevations with a third building at its center (Figure 3-214).

> Known as the 'make-pack' area, it is divided into five bays on the ground floor. This building lies between the East Wing (which houses the administrative offices, cafeteria, visitor's center and auditorium), and the West Wing (which houses the machine shop, parts room, maintenance engineering offices and filter production). The wings are joined to the main plant by ten cores, each 94 feet high, which contain restrooms, employee lounges, mechanics' shops, supervisory offices, and heating and air-conditioning units [The News Leader 1974].

A majority of the Office Building Conference Center is covered by a flat roof. The building features large window openings filled with metal-frame, fixed windows. The towers do not feature fenestration. A large, multi-story, warehouse addition extends from the south elevation. It was barely visible during the time of survey due to accessibility to the property.

A 1973 two-story, Brutalist-style Research Center (office building 1 in Figure 3-212), designed by Ulrich Franzen, is located in the southeast portion of the property and it faces towards Commerce Road (Figure 3-215). The concrete and light-colored, brick-clad building features a recessed first story with a ribbon of metal-frame windows across all elevations. The second story features similar fenestration spanning all elevations with vertical concrete bands evenly spaced over the windows. The recessed primary entrance is centered on the east elevation and filled with commercial-style doors accessed by large concrete steps.

Three circa-1960 warehouses are located on the northwestern side of the complex (warehouse 1, 3, and 4 in Figure 3-212). Warehouse 1 is a one-story building covered by a flat roof. The building was barely visible during the time of survey; however, it appears that it is clad in pressed-metal siding. The roof features stepped metal parapets that stretch from east to west at evenly spaced intervals. The southwest portion of the building is curved for truck docking stations. Warehouse 3 is connected to warehouse 4 by a walkway and a hyphen on the east elevation. It is sheathed in pressed-metal siding. The first story features window openings filled with metal vents while the second story features hooded vents. Two entrances are visible on the south elevation, both of which are filled with a single-leaf metal door accessed by poured-concrete stairs. A two-story, flat-roof addition extends from the southern half of the west elevation. It is clad in a pressed-metal siding and roof is lined with metal coping. Fenestration includes a double-leaf, glass-and-metal doors; single-leaf, metal doors; and fixed, metal-frame windows. Warehouse 4 is two stories tall with pressed-metal siding and is covered by a flat roof. A one-story portion stretches along the western elevation of the building. Two suspended enclosed walkways sheathed in pressed metal extend from the northwest and southwest corners connecting the building to a large gabled warehouse (warehouse 3). A one-story, flat-roof hyphen also extends from the west elevation in the northern half towards the east elevation of the gabled warehouse (warehouse 3) The southern portion of the building appears to have a third story. A metal conveyor belt extends from the south elevation of the southern addition towards the set of silos.

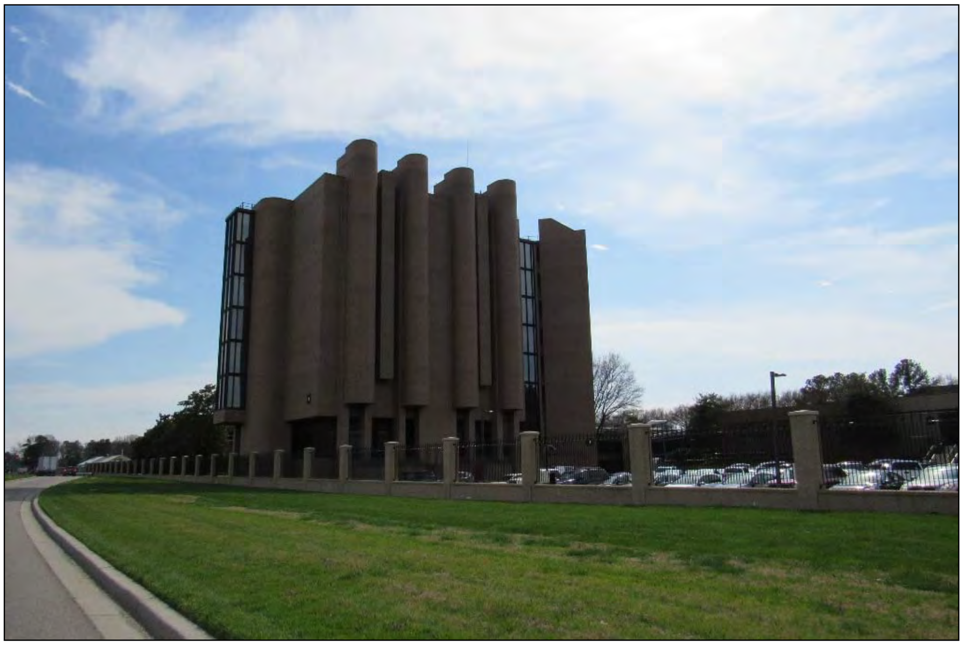

FIGURE 3-213: PHILIP MORRIS OPERATIONS COMPLEX AT 3601 COMMERCE ROAD, NORTHEAST OBLIQUE OF BRUTALIST-STYLE FINANCE BUILDING

A large warehouse (warehouse 2 in Figure 3-212) is located north of the office and conference building and south of Philip Morris Drive Way. It was not visible during the time of survey due to accessibility of the property; however, current aerial imagery shows the building in a rectangular plan, covered by a flat roof.

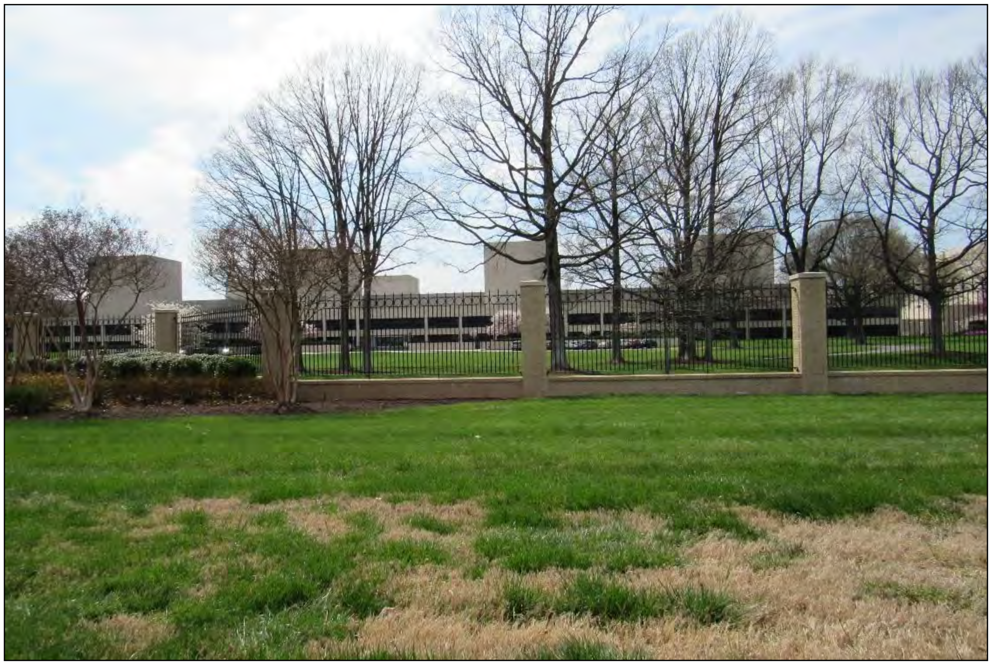

FIGURE 3-214: EAST ELEVATION OF INTERNATIONAL-STYLE OFFICE BUILDING DESIGNED BY SKIDMORE, OWINGS & MERRILL

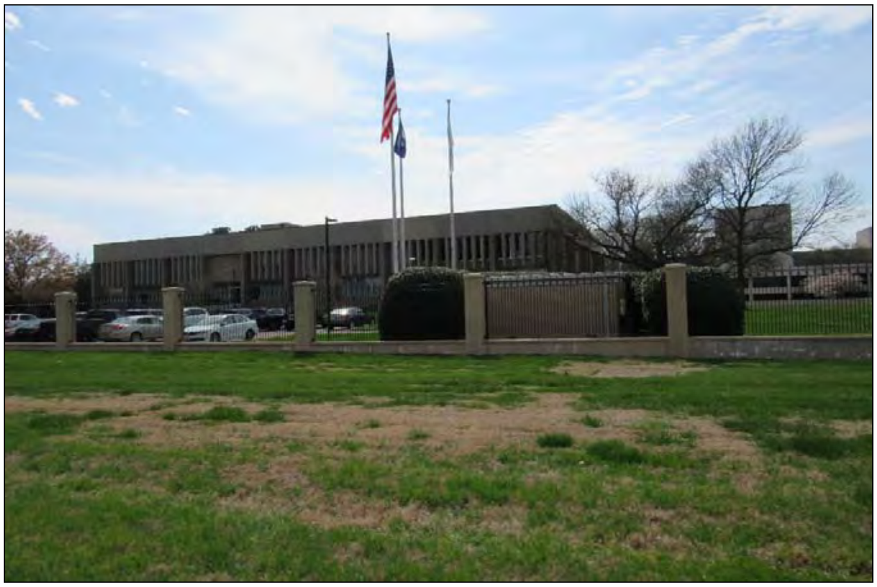

FIGURE 3-215: NORTHEAST OBLIQUE OF BRUTALIST-STYLE RESEARCH CENTER

Two circa-1960 multi-bay office buildings (office buildings 1 and 2 in figure 3-212) are located southeast of the primary resource. Office building 1 is one-story, featuring fixed, metal-frame windows spanning all elevations and covered by a flat roof with metal coping. Office building 2 is two-stories, clad in brick veneer, and topped by a flat rood with metal coping. Ribbons of fixed, metal-frame widows are visible on the south and north elevations. Entrances are situated on the south and north elevations but they were not visible at the time of survey. The roof features a central rectangular access to the roof. An interior-end, brick chimney is located on the south elevation.

Several circa-2000 metal-frame greenhouses (denoted as greenhouses 1 through 5 in Figure 3-212) are located in the southeast corner of the property (Figure 3-216). They are covered with a gabled roof and clear siding of an unknown material. They feature large circular vents in the south elevations and the north elevations contain a metal flue.

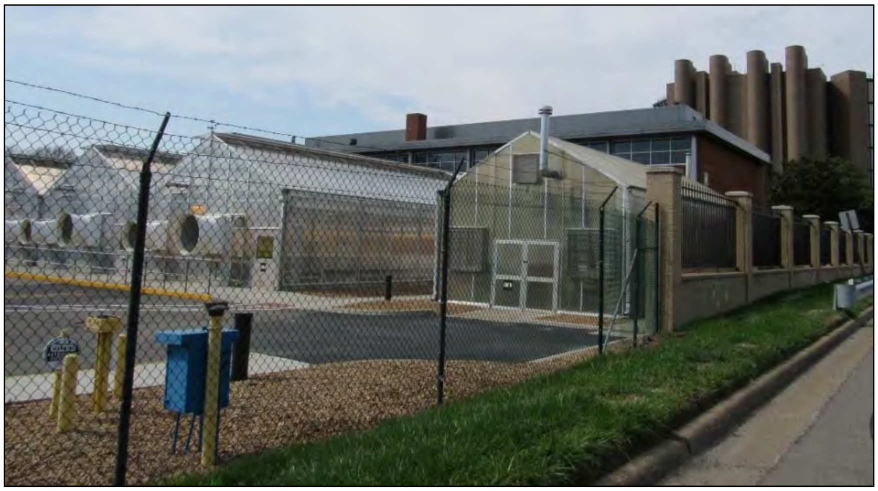

FIGURE 3-216: GREENHOUSES, LOOKING NORTHWEST

Two rectangular-shaped warehouse buildings (warehouse 6 and 7 in Figure 3-212) are located in the southeast corner of the property, west of the greenhouses and office buildings. They were not visible during the time of survey but identified on current online aerials. Aerials indicate that the buildings are covered by a flat roof and connected to one another by a hyphen.

A circa-1990, four-story, industrial warehouse (warehouse 5 in Figure 3-212) is located in the southwest corner of the property (Figure 3-217). It is clad in pressed metal and features a flat roof. The west elevation is lined with six circular metal turbines with a ventilated, metal exterior wall on the west elevation. Two very tall metal possible flues pierce the roof of the building. Above-ground, metal piping extends from the west elevation of the building and continue over Bells Road and they continue south on the west side of the road. Metal pipes extend from the north elevation towards a set of four circa-1990 silos (silos 1 through 4 in Figure 3-212) clad in pressed metal.

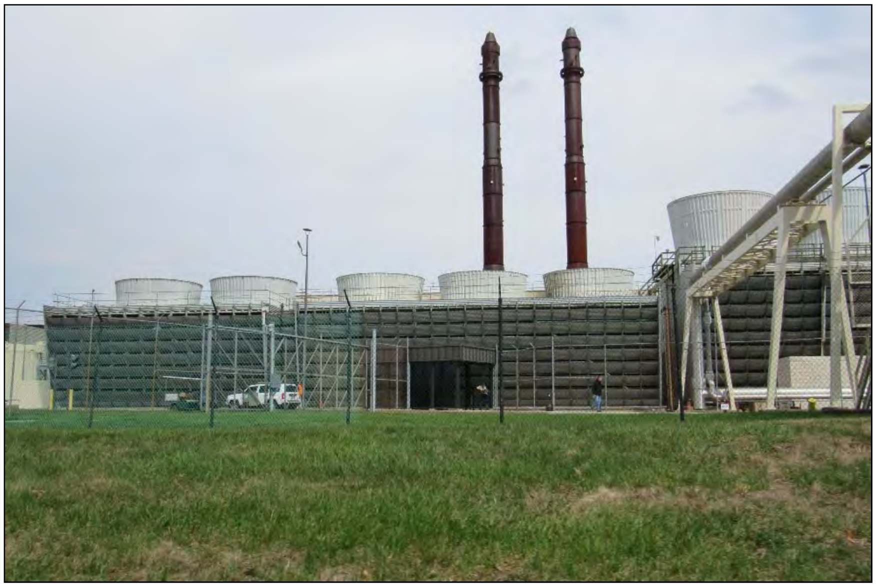

FIGURE 3-217: WAREHOUSE 5, LOOKING EAST FROM BELLS ROAD

Three circa-2002 entrance gates are located at the east and west edges of the primary resource, along Bells Road, Philip Morris Drive Way, and Commerce Road (entrance gate 1–3 in figure 3-212). Entrance gates 1 and 2 feature central metal-clad, gatehouses flanked by vehicular entrances. The gates are covered by a flat roof. Entrance gate 3, located at Commerce Road is a one-story gate framed by a concrete entryway with “Philip Morris USA” on the west elevation (Figure 3-218). A circa-1990, steel-frame, pedestrian walkway extends from the industrial complex towards a parking lot on the southwest side of the Bells Road. It is enclosed by a metal chain-link fence. Located in the northeast corner of the property is a circa-1990, three-story, squared tower. The decorative tower is covered in advertisements for company products.

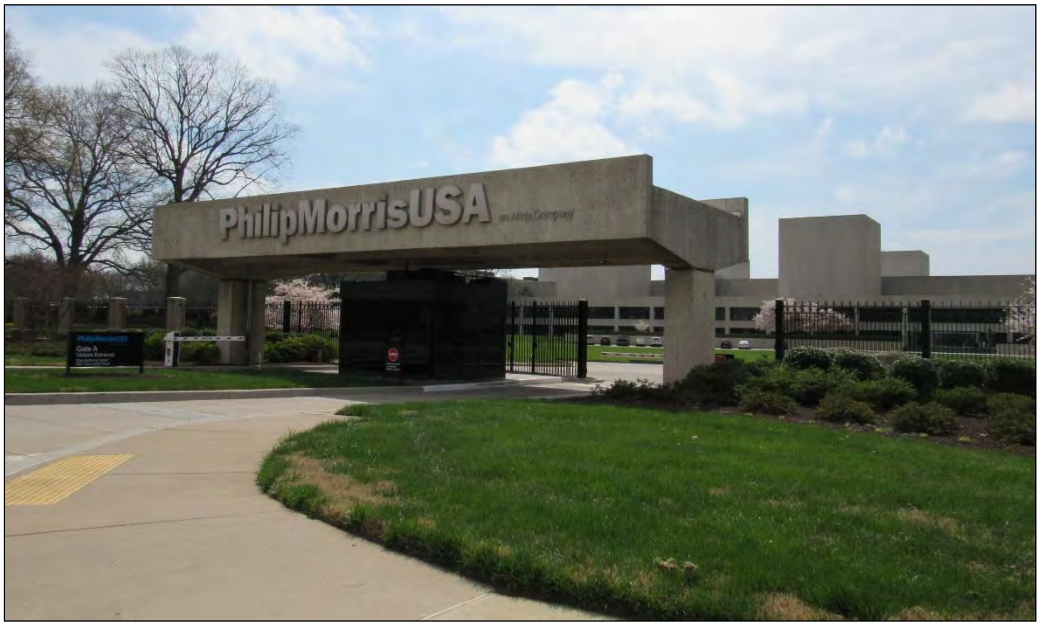

FIGURE 3-218: ENTRY GATE 3, LOOKING SOUTHWEST

3.16.3 NRHP Evaluation

The Philip Morris Operations Complex located at 3601 Commerce Road is a mid-twentieth-century, light-industrial complex that served as headquarters for the company's tobacco production; the main building was constructed between 1959 and 1973. Although the complex is modern, Philip Morris has been operating in Richmond since the early 1930s, with multiple tobacco warehouses located in the Shockoe Valley and Tobacco Row Historic District (127-3044). Construction on their new, larger facility began during the rise of the post-modern architectural movement by famed architects known for their influences in the Brutalist and Neo-Expressionism styles. The resource retains its historic integrity of location, setting, feeling, and association. Buildings added to the complex in the late 1970s that includes silos, greenhouses, and warehouses, have minimally impacted the core of the resource, and as such it retains a high level of integrity of design, materials, and workmanship**.**

Currently, the Altria Group (Philip Morris USA) is the largest cigarette manufacturing company in the United States, with its headquarters located within the same complex as its production warehouses. The second leading U. S. tobacco company is R. J. Reynolds, a tobacco manufacturing company based in Winston-Salem, North Carolina. The R. J Reynolds headquarters, originally located in an Art-Deco style skyscraper constructed circa 1929 and currently listed in the NRHP, has since been relocated and is a separate entity from its production warehouses, which are also located in Winston-Salem (Craver 2014; Covington 2014).

In order for a resource to be considered eligible in the NRHP under Criterion A, "a property can be associated with either (or both) of two types of events… a specific event marking an important moment in American prehistory or history [or] a pattern of events or a historic trend that made a significant contribution to the development of a community, a State, or a nation" (Shrimpton et al. 1990). Philip Morris has been a dominating leader in the tobacco industry since the mid-twentieth century, becoming the highest grossing tobacco company across the globe, with Marlboro becoming the world's number-one cigarette by 1972 (Borio 2001; Philip Morris, Inc.

[PMI] 2018). As a leader in the mid- to late-tobacco industry in America, Philip Morris USA illustrates the rise and fall of an important agricultural commodity in Virginia, as well as the corporate product diversification of the cigarette industry coped with increasing attacks from public health advocates (Borio 2001). As such, the Philip Morris Operations Complex is recommended eligible for listing in the NRHP under Criterion A at the national level for its impacts of commerce and manufacturing in the tobacco industry.

The Philip Morris Complex itself lacks any known associations with any individuals who have "gained importance within his or her group of profession" therefore, the resource is recommended not eligible under Criterion B.

To be eligible in the NRHP under Criterion C, "a property must embody distinctive characteristics of a type, period, or method of construction, represent the work of a master, possess high artistic value, and represent a significant and distinguishable entity whose components may lack individual distinction" (Shrimpton 1990). This property is a significant example of an industrial complex constructed to meet specific requirements of a specialty industry, in particular the need for "modern"-looking buildings with large open spaces, luxury amenities, and good air circulation. Built in the Brutalist and Neoexpressionist styles, with some of the buildings designed by Skidmore, Owings & Merrill and Ulrich Franzen, a famed German-born American architect known for his Modern-style architectural designs (Harvard University Library 2000). As such, it is recommended that the Philip Morris Operation Complex is potentially eligible for inclusion in the NRHP under Criterion C as a good example of an industrial-related building constructed in the post-modern Neoexpressionist and Brutalist styles.

Although the oldest and more notable buildings at the Philip Morris Complex were built by famed architect Ulrich Franzen between the 1950s and 1970s, many of the remaining industrial buildings on the property were constructed less than 50 years ago. The City of Richmond has 11 post-modern industrial buildings, dating pre-1980, recorded with the DHR, including the Mid-Atlantic Coca-Cola Bottling Company (127-6136-0265) designed by Joseph J. Schlesser and the Baker Equipment Engineering Company (127-6136-0237) designed by Henry Carl Messerschmidt. The Philip Morris Complex displays the only Neo-expressionism- and Brutalist-style buildings in Richmond constructed by SOM and renowned architect Ulrich Franzen and has gained exceptional significance as required by Criterion Consideration G for its unique and outstanding Architecture. As an architectural resource, the resource was not evaluated under Criterion D.

In sum, the Philip Morris Industrial Complex is **recommended eligible under Criteria A at the national level and Criteria C and Criteria Consideration G at the local level.**

The period of significance for the Philip Morris Operations Complex is from its construction, circa 1959 until 1974 when the last of the post-modern buildings were constructed. The proposed NRHP boundary for the resource comprises and follows the legal lot description for parcel S0081038001. It is bounded on the east by Commerce Road and I-95, on the south and southwest by Bells Road, on the west by the CSXT railroad, and residential community to the north (Figure 3-219).

SUMMARY AND RECOMMENDATIONS

The DC2RVA Project Team conducted an intensive-level architectural survey of a total of 52 resources, 18 of which are presented in the current report. The DC2RVA project is being completed under the auspices of the FRA in conjunction with the DRPT. Because of FRA's involvement, the undertaking is required to comply with the NEPA and Section 106 of the National Historic Preservation Act of 1966, as amended. The Project is being completed as DHR File Review #2014-0666.

Of the 18 resources detailed in this report, the DC2RVA Project Team are recommending 11 as individually eligible for the NRHP (Table 4-1). Listed in numerical order, they are as follows: Charles Gwathmey House (042-0113), Hunton Treasures (043-0694), Chancellor House (111-0013/ 111-0132-0508), Dr. Charles Mortimer House (111-0067/ 111-0132-0505), Shiloh Baptist Church (New Site) (111-0132-0147), Robert Adams Residence (111-0132-0458), Berkleytown Historic District (166-5073), Dabney Funeral Home (166-5073-0010), Loving's Produce Company (127-0344-0102), Philip Morris Operations Complex (127-5818), and Gilpin Court Apartment Complex (127-6883) are recommended individually eligible for the NRHP. Chancellor House (111-0013/ 111-0132-0508), Dr. Charles Mortimer House (111-0067/ 111-0132-0505), Shiloh Baptist Church (New Site) (111-0132-0147), Robert Adams Residence (111-0132-0458) are also recommended as contributing to the Fredericksburg Historic District (111-0132); Dabney Funeral Home (166-5073-0010) is recommended as contributing to the Berkleytown Historic District (166-5073); and Loving's Produce Company (127-0344-0102) is recommended as contributing to the Shockoe Valley and Tobacco Row Historic District (127-0344).

During the current survey, the DC2RVA Team found that the remaining seven resources (042-0420, 042-0557, 042-5048, 043-0693, 100-5341, 111-0038/111-0132-0509, and 166-5073-0024) are recommended as not individually eligible for the NRHP with the Jones-Monroe-Rennolds House (111-0038/111-0132-0509) contributing to the Fredericksburg Historic District (111-0132) and the Hanover County Public School Board (166-5073-0024) recommended as contributing to the Berkleytown Historic District (166-5073).

TABLE 4-1: TABLE SUMMARY & RECOMMENDATIONS OF THE ARCHITECTURAL RESOURCES PRESENTED IN THIS REPORT

DC2RVA Corridor Area	DHR ID	Name/ Description	City/ County	Date/ Time Period	Phase II Recommendation
2	100-5341	East Rosemont Historic District	City of Alexandria	1915–1950	Not Eligible
3	111-0013/ 111-0132-0508	Chancellor House, 300 Caroline Street	City of Fredericksburg	1812–1831	Eligible under Criterion A; Contributing to Fredericksburg HD
3	111-0038/ 111-0132-0509	Jones-Monroe-Rennolds House, 301 Caroline Street	City of Fredericksburg	ca. 1786	Not Eligible; Contributing to Fredericksburg HD
3	111-0067/ 111-0132-0505	Dr. Charles Mortimer House, House, 213 Caroline Street	City of Fredericksburg	ca. 1764–1801	Eligible under B & C; Contributing to Fredericksburg HD
3	111-0132-0147	Shiloh Baptist Church (New Site), 521 Princess Anne Street	City of Fredericksburg	ca. 1890–1968	Eligible under Criteria A & C & Criteria Consideration A; Contributing to Fredericksburg HD
3	111-0132-0458	Robert Adams Residence, 528 Caroline Street	City of Fredericksburg	1891	Eligible under Criterion C; Contributing to Fredericksburg HD
5	042-0557	Dry Bridge/ Farmstead, 10411 Old Bridge Road	Hanover County	ca. 1854	Not Eligible
5	166-5073	Berkleytown Historic District	Hanover County	ca. 1900–1965	Eligible under Criterion A
5	166-5073-0010	Dabney Funeral Home, 600 B Street	Hanover County	1955–1968	Eligible under Criterion A; Contributing to Berkleytown HD
5	166-5073-0024	Hanover County School Board, 200 Berkley Street	Hanover County	1948–1969	Not Eligible; Contributing to Berkleytown HD
5	042-0113	Charles Gwathmey House, 11247 Gwathmey Church Road	Hanover County	1896–1920	Eligible under Criterion C
5	042-0420	Sinton House, 12081 Holly Oaks Lane	Hanover County	ca. 1890	Not Eligible
5	042-5048	Elmont Historic District	Hanover County	ca. 1880–present day	Not Eligible
5	043-0693	Mill Road Historic District	Henrico County	ca. 1900–present day	Not Eligible
5	043-0694	Hunton Treasures, 11701 Greenwood Road	Henrico County	ca. 1930–1968	Eligible under Criterion C
6	127-6883	Gilpin Court Apartment Complex, Charity Street West/ St. Peter Street	City of Richmond	1942–1955	Eligible under Criteria A & C

TABLE A-2: CHAIN OF TITLE FOR HACKLEY-MONROE-RENNOLDS HOUSE (111-0038/111-0132-0509), CITY OF FREDERICKSBURG, VIRGINIA

INSTR. TYPE	BK	PG	DATE	GRANTOR	GRANTEE	NOTES / COMMENTS
Deed	F	516	1/17/1820	John T. Ford and Patsy Ford	Phillip Harrison (second) and Robert S. Chew (third)	
Deed	F	149	9/26/1816	Thomas Reade Rootes, Jr. and Ann Rootes	John T. Ford	$3,500.00
Deed of Trust	E	431	1/24/1816	Thomas Reade Rootes, Jr.	Farmers Bank of Virginia (second) and Dabney Herndon (third)	Farmers Bank advanced Thomas Reade Rootes, Jr. a loan of $5,560.00. This deed of trust includes the house but the slaves and household furnishings as well. If Rootes should sell the property by December 18, 1816, he will be released from the trust. There is to be a public sale in front of the Columbia Inn which was advertised in the paper for eight weeks.
Deed	E	431	5/12/1806	Thomas Reade Rootes and Sarah Rootes	Thomas Reade Rootes, Jr.	Mr. Benjamin Botts was the occupant of the house as well as the office on the grounds
Deed	C	395	3/25/1800	George W. Thorton (heir at law of George Thorton, deceased), John Posey and Lucy (daughter of George Thorton, deceased), and Joseph Jones	Thomas Reade Rootes	George Thorton agreed to sell to Preston Bowden part of lots 254 and 264 by contract dated 9/30/1780). Bowden agreed by contract to sell the property to Joseph Jones. Joseph Jones, in turn, sold it to Thomas Reade Rootes. George Thorton died without executing deeds for the property. His will directed that all debts due his estate should be for his unborn child (Lucy Posey). Through this deed, Thorton and Posey will finally receive money from the sale.
Deed	H	394	11/11/1772	Benjamin Grimes	John Taylor, Francis Thorton (executors of Presley Thorton) and William Fitzhugh (second) and Joseph Jones and William Woodford (third)	In 1772, executors of Presley Thorton and William Fitzhugh finally sold the properties to Joseph Jones and William Woodford. Joseph Jones and William Woodford built a brewery on lots 264 and 272. In 1773, George Thorton joined the partnership. In 1779 William Woodford turned over his share of the business and properties in a deed that mentions a tannery as well as the brewery.

APPENDIX E

UPDATED SECTION 106 AND SECTION 4(f) COMMENTS & COORDINATION

D.C. TO RICHMOND SOUTHEAST HIGH SPEED RAIL

Appendix E

UPDATED SECTION 106 AND SECTION 4(f) COMMENTS & COORDINATION

This appendix includes data associated with the coordination of Section 106 of the National Historic Preservation Act of 1966 and Section 4(f) of the U.S. Department of Transportation Act of 1966 with pertinent federal agencies, state governments, and localities, as well as consulting parties and other involved members of the public. Data presented here is reflective of coordination efforts that occurred from August 2017, after the publication of the Draft Environmental Impact Statement (EIS), through the publication of the Final EIS. For coordination that occurred prior to August 2017, see Appendix U of the Draft EIS.

Section E.1 involves all correspondence associated with Section 106 of the National Historic Preservation Act of 1966 and any other cultural resource topics. Cultural resource studies have included coordination with agencies since the fall of 2014 to comply with cultural resource and environmental legislation. In particular, coordination has involved extensive dialogues with the Virginia Department of Historic Resources (DHR, the Virginia State Historic Preservation Office [SHPO]), the Advisory Council on Historic Preservation (ACHP), the Virginia Department of Rail and Public Transportation (DRPT), the Federal Railroad Administration (FRA), and over 30 consulting parties spanning the entire corridor. This chapter includes data on correspondence with all groups and includes the following documentation in separate PDFs in chronological order:

- Appendix E1: SHPO, ACHP, DRPT, and FRA Meeting Summaries
- Appendix E2: SHPO Technical Study Correspondence
- Appendix E3: SHPO Project Effect
- Appendix E4: SHPO Memorandum of Agreement Correspondence
- Appendix E5: Consulting Party and Public Invitations, Emails, Letters, and Other Correspondence
- Appendix E6: Consulting Party and Public Meeting Summaries

Section E.2 includes documentation related to the Section 4(f) process, including parks, recreational resources, trails, and wildlife refuges, and historic properties as they relate to Section 4(f). The following documentation includes separate PDFs in chronological order:

- Appendix E7: *De Minimis* Concurrence Letters
- Appendix E8: Temporary Occupancy Concurrence Letters

E.1 SECTION 106/OTHER CULTURAL RESOURCE COMMENTS & COORDINATION

DRPT coordinated with numerous federal and state agencies with jurisdiction over resources protected under Section 106 and Section 4(f), both before and after the issuance of the Draft EIS (see Appendix E1 of the Final EIS). For Section 106, this includes project initiation, definition of an area of potential effects (APE), technical studies on above- and below-ground resources (see Appendix E2 of this Final EIS for correspondence since the Draft EIS), resource eligibility, determinations of effect (see Appendix E3 of the Final EIS), and production of a Section 106 Draft Memorandum of Agreement (MOA) to outline measures to mitigate adverse effects, where appropriate (see Appendix E4 of the Final EIS for coordination efforts; the Section 106 Draft MOA document is Appendix K of the Final EIS). Beyond agencies, extensive coordination with consulting parties and others with a vested interest in area history and prehistory has occurred since the Project began (see Appendices E5 and E6 of the Final EIS for coordination with consulting parties since publication of the Draft EIS).

For Section 4(f), each historic property—defined as a resource that is eligible for or listed in the National Register of Historic Places (NRHP)—was evaluated for Project "use" as defined by Section 4(f). Where FRA determined that the Project will result in a Section 4(f) use and there are no feasible and prudent alternatives, FRA provided individual Section 4(f) evaluations to the U.S. Department of Interior (DOI) Office of Environmental Compliance and Policy for review and concurrence.

E.1.1 Consulting Parties

While FRA continued to be the primary point of contact for all federally recognized tribes, FRA delegated all other state agency and consulting party coordination to DRPT in 2014. As such, DRPT sent invitation letters to agencies, local governments, and other stakeholders in the Section 106 consultation process. FRA sent a letter to the federally recognized tribes along the DC2RVA corridor.

Table E.1-1 provides information on the 50 distributed consulting party invitations. Of these, 23 elected to participate in the process; the table below lists these groups, along with their response dates. For an additional 11 stakeholders, DRPT assumed that they would want to participate and has treated them as consulting parties. Although a formal response was not received from these 11 groups, they have requested participation on similar projects and have shown a noted interest in the current undertaking through telephone calls or attendance at associated meetings. These 11 are noted by "assumed yes" in Table E.1-1.

Table E.1-1: List of Invited Consulting Parties

Stakeholder	Invite Letter Date	Response (Date)
American Battlefield Protection Program (ABPP)	January 6, 2015	Assumed Yes
Marine Corps Base Quantico	January 6, 2015	Assumed Yes
National Park Service—Northeast Regional Office	July 11, 2018	Yes (7/11/18)
National Park Service—Captain John Smith Chesapeake NHT	January 6, 2015	Yes (1/22/15)
National Park Service—Fredericksburg	January 6, 2015	Assumed Yes
National Park Service—GW Memorial Pkwy	July 1, 2017	Yes (7/1/2017)
National Park Service—National Capital Region	January 6, 2015	Assumed Yes
National Park Service—Potomac Heritage National Scenic Trail	January 22, 2015	Yes (3/4/2015)
National Park Service—Richmond	January 6, 2015	Yes (1/14/15)
National Park Service—Washington-Rochambeau NHT	January 22, 2015	Assumed Yes
Alexandria Archaeology	January 6, 2015	Yes (1/21/15)
Arlington County	January 6, 2015	Yes (1/14/15)
Caroline County	January 6, 2015	Yes (2/3/15)
City of Alexandria	January 6, 2015	Yes (10/11/17)
City of Fredericksburg	January 6, 2015	Yes (1/12/15)
City of Richmond	January 6, 2015	Yes (1/16/15)
Hanover County	January 6, 2015	Yes (2/3/15)
Prince William County	January 6, 2015	Yes (2/13/15)
Town of Ashland	January 23, 2017	Yes (2/23/17)
Ashland Museum	January 6, 2015	Yes (1/21/15)
Central Virginia Battlefields Trust (CVBT)	January 6, 2015	Yes (1/22/15)
Civil War (now Battlefield) Preservation Trust (CWT)	January 6, 2015	Yes (2/11/15)
Historic Fredericksburg Foundation, Inc. (HFFI)	January 6, 2015	Yes (1/9/15)
Historic Richmond Foundation	January 6, 2015; Resent November 13, 2016	Yes (11/28/16)
Preservation Virginia	June 21, 2018	Yes (6/21/18)
National Trust for Historic Preservation (NTHP)	January 6, 2015; Resent December 22, 2016	Yes (12/22/16)
Pamunkey Indian Tribe	July 9, 2015; Resent April 12, 2017	Assumed Yes
Chickahominy Indian Tribe	February 13, 2018 from FRA	Assumed Yes
Eastern Chickahominy Indian Tribe	February 13, 2018 from FRA	Assumed Yes
Upper Mattaponi Indian Tribe	February 13, 2018 from FRA	Yes (2/23/18)
Rappahannock Indian Tribe	February 13, 2018 from FRA	Assumed Yes
Nansemond Indian Tribe	February 13, 2018 from FRA	Assumed Yes

▶ *Continued – see end of table for notes.*

Table E.1-1: List of Invited Consulting Parties

Stakeholder	Invite Letter Date	Response (Date)
Monocan Indian Tribe	February 13, 2018 from FRA	Assumed Yes
Fairfax County	January 6, 2015	No Reply
Henrico County	January 6, 2015	No Reply
Spotsylvania County	January 6, 2015	No Reply
Stafford County	January 6, 2015	No Reply
ACL & SAL RR Historical Society	January 6, 2015	No Reply
Center for Neighborhood Revitalization	January 6, 2015	No Reply
Arlington Historical Society	January 6, 2015	No Reply
Caroline Historical Society Chesterfield Historical Society	January 6, 2015 January 6, 2015	No Reply No Reply
Hanover County Historical Society, Inc.	January 6, 2015	No Reply
Henrico County Historical Society	January 6, 2015	No Reply
Historic Alexandria Foundation	January 6, 2015	No Reply
Historic Prince William, Inc.	January 6, 2015	No Reply
Historical Society of Fairfax County, Virginia, Inc.	January 6, 2015	No Reply
Stafford County Historical Society	January 6, 2015	No Reply
Catawba Indian Tribe (based in South Carolina)	January 6, 2015	No Reply per FRA protocol for Catawba

Note: 1. The letters to the Native American tribes were sent by FRA. None of the tribes were federally recognized at the time the initial letters (dated 1/6/15) were disseminated. They were recognized at a later date (2/13/18), at which time the FRA invited them to participate.

E.1.2 Meetings

DRPT has held numerous in-person and telephone-based meetings with DHR, ACHP, consulting parties, and other vested individuals and groups. They included a Section 106 kick-off and an abundance of follow-up meetings to update participating agencies and parties on the Project initiation; determination of APE; cultural resource methodology for the reconnaissance predictive model, identification surveys, and evaluation studies; survey results and list of historic properties; Project effect on historic properties; stipulations to mitigate adverse effects; and crafting the Section 106 Draft MOA. Multiple invitations to each meeting and reminders were sent to consulting parties.

Table E.1-2 highlights the meetings held with these groups. Minutes for meetings held prior to the publication of the Draft EIS in September 2017 can be found in Appendix U of the Draft EIS. Minutes for meetings held since the publication of the Draft EIS can be found in Appendices E5 and E6. The public was invited to the Shockoe area meeting on October 12, 2018 but in general, consulting party meetings were limited to that group. Rather, numerous public meetings were held as part of the larger NEPA process, and details can be found in Chapter 2 of the Final EIS. The exception to this is within Richmond, where a number of vested individuals and groups requested additional data on the parameters of the Project and its potential impacts on cultural resources. Meetings were held to discuss historic properties in Shockoe Bottom and the Grave Yard for Free People of Color and Slaves (44HE1203) near Hospital Street to address specific concerns. Additional data on these meetings can be found in the table below.

Table E.1-2: Section 106 and Section 4(f) Cultural Resource Meetings

Date	Attendees	Topics
November 7, 2014	DHR, DRPT	Kick-off meeting; discussions on APE, methodology, reporting
March 19, 2015	VDOT, DRPT	Roadway bridges and Section 106 coordination
February 18, 2016	DHR, DRPT	Update on corridor and status of studies
June 14, 2016	CWT	General discussion on results to date; Richmond to Raleigh Memorandum of Agreement
August 10, 2016	DHR, DRPT	Preliminary dialogue on historic properties and Project effect
May 15, 2017	Ashland Museum, Town of Ashland	Overview of 106 process and technical studies to date
June 8, 2017	NPS- Fredericksburg, DRPT	Update on technical studies and Project plans
July 14, 2017	Town of Ashland; Ashland Museum	Update on technical studies and Project plans
July 26, 2017	DHR, DRPT	Update on technical studies and Project schedule
August 14, 2017	NPS—Richmond, DRPT	Update on technical studies and Project plans
October 11, 2017	Hanover County, Town of Ashland, Ashland Museum	Update on technical studies and Project plans
October 20, 2017	Alexandria Archaeology, City of Alexandria, Arlington County, NTHP, DRPT	Update on technical studies and Project plans
October 24, 2017	ACHP, ABPP, CWT, DRPT	Update on technical studies and Project plans
October 27, 2017	Prince William County, Caroline County, City of Fredericksburg, CVBT, HFFI, DRPT	Update on technical studies and Project plans
October 30, 2017	City of Richmond, Historic Richmond Foundation, DRPT	Update on technical studies and Project plans
February 8, 2018	Rose Center/Urban Land Institute, DRPT	Overview of Project and history of Shockoe Bottom
February 13, 2018	DHR, DRPT	Update on technical studies and Project schedule
April 4, 2018	DHR, DRPT	Discussion of Project limits of disturbance and APE
June 18, 2018	Town of Ashland, Ashland Museum	Historic property list and 106 process
June 19, 2018	DHR, DRPT	Historic properties and Project effect
June 21, 2018	CWT, Historic Richmond Foundation, Town of Ashland, Ashland Museum, Preservation Virginia, DRPT	Historic properties and Project effect
June 26, 2018	ABPP, City of Fredericksburg, NPS Fredericksburg, DRPT, FRA	Historic properties and Project effect
June 28, 2018	NTHP, Alexandria Archaeology, NPS—Mount Vernon Parkway, ACHP, DRPT	Historic properties and Project effect
July 2, 2018	DHR, FRA, DRPT	Revisit of historic properties and Project effect
July 16, 2018	Town of Ashland, Ashland Museum	Technical reports and Project effect
July 17, 2018	NPS- Fredericksburg	DC2RVA LOD and Jackson's Shrine

▶ *Continued.*

Table E.1-2: Section 106 and Section 4(f) Cultural Resource Meetings

Date	Attendees	Topics
July 17, 2018	Preservation Virginia	DC2RVA Project summary and list of historic properties
July 19, 2018	City of Richmond, DRPT	Historic properties and Project effect
July 24, 2018	DHR	Resources in Shockoe Bottom
July 26, 2018	FRA, DHR, DRPT	Resources in Shockoe Bottom
July 27, 2018	ACHP	Resources in Shockoe Bottom
July 31, 2018	DHR, FRA, DRPT	Resources in Shockoe Bottom
August 3, 2018	DHR	Resources in Shockoe Bottom
August 6, 2018	DHR, DRPT, VA Secretary of Transportation, VA Secretary of Natural Resources	Discussion on historic resources in Shockoe Bottom
August 29, 2018	City of Richmond, DHR	Resources in Shockoe Bottom, City preservation initiatives near Main Street Station and future projects
September 5, 2018	VA Secretary of Transportation, DHR, DRPT, City of Richmond	Discussion of cultural resources in Shockoe Bottom
September 10, 2018	NTHP, Preservation Virginia, Sacred Ground Project, ACHP, DHR, DRPT	Discussion of upcoming meeting in Shockoe/Richmond, including meeting content and attendees
October 2, 2018	FRA, DHR, ACHP, DRPT	Summary of three October 2018 consulting party meetings, Resources in Shockoe Bottom, Next steps in 106 process
October 2, 2018	DRPT, City of Alexandria	List of historic properties, Project effect
October 4, 2018	City of Fredericksburg, Prince William County, Ashland Museum, Alexandria Archaeology, DRPT, FRA	APE, list of historic properties, Project effects, Section 106 Draft MOA mitigation
October 5, 2018	American Battlefield Trust (Civil War Trust), ABPP, Alexandria Archaeology, NPS- Mount Vernon Parkway, NPS- National Capital Region	APE, list of historic properties, Project effects, Section 106 Draft MOA mitigation
October 12, 2018	NTHP, Shockoe Partnership, ACHP, Preservation Virginia, City of Richmond, Slave Trail Commission, Historic Richmond Foundation, Untold RVA, DHR, FRA, DRPT, private citizens	On-site visit at Main Street Station, APE, list of historic properties, Project effects, Section 106 Draft MOA mitigation
October 15, 2018	Historic Richmond Foundation, DRPT	Resources in Shockoe Bottom, list of historic properties, Project effect, Section 106 Draft MOA mitigation
October 23, 2018	ACHP, DHR, FRA, DRPT	Update on consulting party meetings, list of historic properties, Project effect
October 24, 2018	Ashland Museum, Town of Ashland, DRPT	List of historic properties, Project effect, Section 106 Draft MOA mitigation
November 1, 2018	Preservation Virginia, DRPT	Resources in Shockoe Bottom, list of historic properties, Project effect, Section 106 Draft MOA mitigation
November 2, 2018	Elegba Folklore Society, DRPT	Summary of Project, Resources in Shockoe Bottom, list of historic properties, Project effect, Section 106 Draft MOA mitigation

Table E.1-2: Section 106 and Section 4(f) Cultural Resource Meetings

Date	Attendees	Topics
November 28, 2018	NTHP, DRPT	Discussion on reply sent to NTHP on Historic Properties
December 2, 2018	NTHP, Preservation Virginia, Historic Richmond Foundation, Elegba Folklore Society, City of Richmond, DRPT, FRA, ACHP, DHR	Additional discussion on reply sent to NTHP, historic properties in Shockoe Bottom, and effect on historic properties
January 31, 2019	DRPT, DHR	Site 44HE1203 (Grave Yard for Free People of Color and Slaves)
February 13, 2019	Rivanna Archaeology, Historic Richmond Foundation, Sacred Ground Project, Richmond Archaeology, DRPT, DHR, VDOT	Onsite meeting to discuss site 44HE1203 (Grave Yard for Free People of Color and Slaves)

E.1.3 Correspondence

Since the Project's initiation, correspondence has occurred between DRPT and the cultural resource agencies, localities, and consulting parties to keep them informed on the progress of the studies, resource eligibility, the Project's effects on historic properties, and Section 106 Draft MOA mitigation strategies. DRPT held meetings at milestones or as necessary throughout the Project. In particular, meetings and e-mail exchanges with DHR and ACHP have occurred regularly to provide information on Project plans. Data on the study results in specific Project areas were also sent to consulting parties to garner comments on the Project. The architectural reports were posted on the Project's webpage for general public comment as well. The archaeological reports were only distributed to the agencies, localities, and consulting parties due to the sensitivity of site location mapping and to meet stipulations set forth in the Archeological Resources Protection Act of 1979.

Table E.1-3 includes correspondence conducted as part of the process. Note that this table only lists formal correspondence and group emails. In addition to this roster, hundreds of one-on-one emails were exchanged with consulting parties and the general public to convey additional cultural resource data pertaining to the Project. Copies of relevant correspondence prior to September 2017 are included in Appendix U of the Draft EIS and post-September 2017 correspondence can be found in Appendices E1 through E6.

Table E.1-3: Project Correspondence

Date	Medium	Recipient	Topic
September 25-October 15, 2014	E-mail; Letter	DHR, FRA, DRPT	Initiation of Section 106 Process
January 5-February 2, 2015	E-mail, Letter	DHR, FRA, DRPT	Defining Project APE
June 8, 2015	E-mail	VDOT	VDOT/DHR PA on Historic Bridges
June 22, 2015	Letter	Civil War Trust, DRPT	Receipt of comments on Project screening review
July 30, 2015	E-mail	All Consulting Parties, DRPT	Distribution of Archaeological Predictive Model report for review

E.2 SECTION 4(f) COMMENTS & COORDINATION

Table E.2-1 includes the correspondence subsequent to the publication of the Draft EIS in September 2017 related to Section 4(f) for parks, recreation areas, trails, and wildlife and waterfowl refuges (this information is also provided in Table 6.8-1 of the Final EIS). Section 4(f) correspondence prior to the Draft EIS publication is included in Appendix U of the Draft EIS.

Table E.2-1: Section 4(f) Correspondence

Resource Owner	Type[1]	Date	Purpose
Arlington County	Response Letter	September 8, 2017	Expressed concern with *de minimis* assumption based on Draft EIS impacts
Virginia Department of Game and Inland Fisheries	Response Letter	October 12, 2017	Concurrence with temporary occupancy of Mattaponi Wildlife Management Area
Arlington County	Meeting	February 2, 2018	Review of Draft EIS comments
City of Richmond, Department of Public Works	Letter	October 22, 2018	Provided update of impacts, requested concurrence with *de minimis* use and temporary occupancy of Walker's Creek Retention Basin Park
City of Richmond, Department of Parks, Recreation, and Community Facilities	Letter	October 22, 2018	Provided update of impacts, requested concurrence with *de minimis* use and temporary occupancy of Walker's Creek Retention Basin Park
Arlington County Department of Parks and Recreation	Letter	October 29, 2018	Provided update of impacts to Long Bridge Park and Mount Vernon Trail, and requested concurrence with temporary occupancy for Long Bridge Park
NPS – George Washington Memorial Parkway Headquarters	Letter	October 29, 2018 and December 6, 2018	Provided update of impacts and requested concurrence regarding temporary occupancy of George Washington Memorial Parkway and Mount Vernon Trail
City of Alexandria	Letter	October 29, 2018	Provided update of impacts and requested concurrence with temporary occupancy of Dog Run Park at Carlyle, Four Mile Run Trail, Potomac Yard Park, Potomac Yard Landbay N., and Rail Park
NPS – Fredericksburg and Spotsylvania National Military Park	Letter	October 29, 2018	Provided update of impacts and requested concurrence regarding temporary occupancy of Fredericksburg and Spotsylvania National Military Park
Prince William County Parks and Recreation Department	Letter	October 29, 2018	Provided update of impacts and requested concurrence regarding temporary occupancy of Veterans Memorial Park
Henrico County Recreation and Parks	Letter	October 29, 2018	Provided impacts and requested concurrence regarding temporary occupancy of Laurel Recreation Area
Henrico County Recreation and Parks	Response Letter	October 31, 2018	Concurrence regarding temporary occupancy of Laurel Recreation Area
Prince William County Parks and Recreation Department	Response Letter	November 2, 2018	Concurrence regarding temporary occupancy of Veterans Memorial Park
City of Richmond, Department of Public Works	Response Letter	November 16, 2018	Concurrence regarding *de minimis* use and temporary occupancy of Walker's Creek Retention Basin Park
NPS – Fredericksburg and Spotsylvania National Military Park	Response Letter	December 7, 2018	Concurrence regarding temporary occupancy of Fredericksburg and Spotsylvania National Military Park

▶ *Continued – see end of table for notes.*

Table E.2-1: Section 4(f) Correspondence

Resource Owner	Type[1]	Date	Purpose
NPS – George Washington Memorial Parkway Headquarters	Response Letter	December 12, 2018	Concurrence regarding temporary occupancy of George Washington Memorial Parkway and Mount Vernon Trail
City of Alexandria	Response Letter	December 13, 2018	Concurrence regarding temporary occupancy of Dog Run Park at Carlyle, Four Mile Run Trail, Potomac Yard Park, Potomac Yard Landbay N., and Rail Park
Arlington County Department of Parks and Recreation	Response Letter	December 18, 2018	Concurrence regarding temporary occupancy of Long Bridge Park

Notes: 1. "Letter" denotes a letter from DRPT to the resource owner; "Response Letter" denotes a letter from the resource owner to DRPT.

Appendix E7 includes correspondence related to the *de minimis* impacts associated with Walker's Creek Retention Basin Park.

Appendix E8 includes correspondence related to concurrence that the temporary occupancy of the following parks does not result in a Section 4(f) use:

- Long Bridge Park
- Mount Vernon Trail
- George Washington Memorial Parkway
- Dog Run Park at Carlyle
- Four Mile Run Trail
- Potomac Yard Park
- Potomac Yard Landbay N.
- Rail Park
- Fredericksburg and Spotsylvania National Military Park
- Veterans Memorial Park
- Laurel Recreation Area

DHR Project Update (DHR Project #2014-0666)
February 13, 2018; 12:00pm

Agenda & Meeting Notes

Attendees:

Marc Holma- DHR
Emily Stock- DRPT
Carey Burch- HDR/Project Team
Steve Walter- Parsons/Project Team
Kerri Barile- Dovetail/ Project Team

1) DEIS Update (Steve, Emily, and Kerri)
- Publication and hearings
- Summary of public comments
- Summary of consulting party comments

2) Preferred Alternative and CTB Decision (Carey and Emily)
- General description
- Fredericksburg
- Ashland
- Richmond

3) Cultural Resource Studies (Kerri)
- Summary of data presented in DEIS
- Description of 2018 studies
- Schedule
- Milestones/Deadlines

4) Next Steps (Kerri and Carey)
- Cultural resource studies
- Consulting party meetings
- FEIS (including supplemental info on F'burg, Ashland, and Shockoe)
- MOA
- ROD

5) Questions and Answers on Agenda Items and Project as a Whole (all)

Beyond the items listed in the agenda and described as such, the following questions/topics were discussed:

Marc asked about the comments received on the DEIS, in particular Ashland. Were the comments about the historic district or the project in general? Steve replied that most were concerned with their own property but a few individuals did mention cultural resources in their reply.

Steve went on to say that the comments were as expected regarding areas of potential controversy such as Fredericksburg, Ashland, and Richmond. Those who lived along the proposed bypass in Ashland preferred the through-town alternative and those in town preferred the bypass. No one really thought the Fredericksburg bypass was the way to go. In Richmond, concerns revolved around the Sacred Ground site near Main Street Station as well as making sure the preferred alternative fit within the larger city plans/initiatives.

Kerri gave everyone minutes from the consulting party meetings held in the fall of 2017 and summarized the main consulting party concerns: 1) Several wanted to assure that noise and vibration studies were included in the environmental analysis and the team confirmed that they were; 2) some asked about cumulative effects (i.e., if you build it, they will come; thus, the rail will bring development) and the team and FRA state that cumulative development is not part of the current project. She also brought up a few specific items that were mentioned by consulting parties that she wanted DHR to be aware of:

- Ashland Museum does not agree with the recommendations of the project team, the consultants hired by Ashland to do a cost share survey of the same area (Commonwealth), or the DHR’s determinations on eligibility.
- Prince William County asked that the team take a look at Rippon Lodge and see if it should be included in the APE. Benjamin Latrobe sketched the view down Neabsco Creek during his visit in the early 19th century. In response to this inquiry, the team did go to Rippon Lodge and the project area is clearly visible. This resource is being added to the APE/list of historic properties even though it is outside of the 500-foot buffer.
- ABPP requested that KOKOA analysis be done on all battlefields. The team asked the DHR if this was required. A discussion on the project components/impacts ensued, and the DHR stated that KOKOA was not needed at this time due to the parameters of the undertaking and the fact that the rail is eligible under Criterion A.
- It was also mentioned that the ACHPO has decided that they want to be involved in this project despite previously signing an umbrella PA stating that they would not be involved. A meeting will be held in the near future, and all parties will be invited.

The conversation then turned to Shockoe Bottom. Carey presented details on the Urban Land Institute project that had been completed the week before and explained both the potential impacts in this area because of the DC2RVA project as well as the efforts that the team has taken to assure that significant resources would be avoided. One of these items is the inclusion of a special chapter in the Final EIS describing work done here to date, the importance of the area, and measures taken to minimize impacts. Marc said this sounded logical. Plans were reviewed, and Marc said that it would be wise to avoid bringing the Main Street Station platforms north of Broad Street as the potential to impact resources through the construction of additional structures as well as intrusions to visual elements dramatically increases in this area.

A schedule of upcoming cultural resource tasks was disseminated and discussed, and Marc agreed to help out as he can with expedited reviews based on the schedule as presented. This notably includes a preliminary review of resources being recorded at the Phase I level that would need Phase II evaluations and a meeting to discuss project effects followed by a concurrence letter. He asked if the MOA would be done prior to the FEIS, and the team said no. It would be done between the FEIS and ROD. Kerri said she would give Marc and the DHR as much of a heads-up as possible prior to a report landing on their desk for review.

In a discussion on next steps, Kerri mentioned that the six new federally recognized tribes had been invited to participate as consulting parties and she would let the DHR know if any accepted. Additional consulting party meetings will be held this summer once the additional studies are done. Future DHR consultation meetings will be held in June or July regarding project effects and this fall to discuss the MOA.

Steve indicated that our current schedule includes publication of the Final EIS in September of this year and the Record of Decision (ROD) approximately two months later in November. We committed to keeping Marc and the DHR informed of the progress towards these dates.

The meeting ended at 1:15pm.

801 E. Main St., Suite 1000
Richmond, VA 23219

DHR Project Effects Meeting (DHR Project #2014-0666)
June 19, 2018; 1:00 pm

AGENDA & MEETING NOTES

Attendees:

Marc Holma- DHR
Emily Stock- DRPT
Carey Burch- Project Team
Steve Walter- Project Team
Kerri Barile- Project Team
Heather Staton- Project Team

1) Update on Current Project Status (Emily)

2) Summary of Cultural Resource Studies (Kerri)
- 2018 Technical Reports
- List of Historic Properties

3) Project Effect (Marc and Team)

4) Next Steps (Kerri, Steve, and Carey)
- Effect Letter for Signature
- Consulting Party Meetings
- MOA Production
- FEIS Completion
- ROD

801 E. Main St., Suite 1000
Richmond, VA 23219

DHR Project Update (DHR Project #2014-0666)
July 2, 2018; 9:00am

Meeting Notes

Attendees:

Marc Holma- DHR
John Winkle- FRA
Emily Stock- DRPT
Steve Walter- Project Team
Kerri Barile- Project Team
Heather Staton- Project Team
Emily Calhoun- Project Team

1) Consulting Party Update= Kerri Barile provided a general update of the three consulting party meetings held in June 2018. Marc asked questions on general tone and content.

2) Mt. Vernon Highway/Long Bridge study= Emily Stock provided an update on the two projects to start a dialogue on how they are connected. They are independent projects but do have connections. Long Bridge will be done first. DC2RVA can function without Long Bridge being done, though.

- Discussion moved to cultural resources, and Kerri Barile mentioned overall SEHSR PA, which included both Long Bridge and DC2RVA. Marc Holma asked if ACHP is okay with them being done separately, and Kerri mentioned that they signed the PA which stated that this could occur. John Winkle said he would follow up with FRA Long Bridge lead to make sure communication is open.

- Marc Holma said he received a call from Matt Virta with the GW Parkway, and he suggested we get Matt additional information.

3) Mason's Hall in Richmond= Due to consulting party concerns, Mason's Hall was added to the APE. It is located on the edge of the indirect APE to the east of Main Street Station. Maps were shared and a brief discussion ensued. Kerri Barile stated that a revised effect letter would be heading to DHR with this data in the coming week.

4) Shockoe Area= Group had a long dialogue on the consulting party meetings, idea of a Traditional Cultural Property, and project avoidance and mitigation. Role of the City of Richmond was also discussed. John Winkle described FRA's legal obligations as viewed through 106/4(f) lens.

- Marc Holma suggested a more thorough dialogue with the City of Richmond on this area to understand what they have done and what they intend to do from a CR perspective.

- Regarding proposed park, John Winkle stated that FRA looks at what is planned and funded.

- Of specific interest during the call were the two sites associated with the slave trade that are near the project but not within the archaeological APE. Should they be included? Should they be considered eligible under both A and D?

- All parties agreed to continue the dialogue on all of these areas with project participants and outside groups.

The meeting ended at 9:45am.

Richmond, VA 23219

DHR Shockoe Update (DHR Project #2014-0666)
July 24, 2018; 1:30pm

Meeting Notes

Attendees:

Marc Holma- DHR
Roger Kirchen- DHR
Sarah Stokley- ACHP
Emily Stock- DRPT
Steve Walter- Project Team
Kerri Barile- Project Team

Held call regarding the ongoing dialogues regarding Shockoe Bottom. In particular, the consulting party meetings and National Trust for Historic Preservation (NTHP) letter (dated July 20) were discussed.

- DHR shared general thoughts on the Shockoe items as stated by both Marc and Roger as well as Julie Langan, the State Historic Preservation Officer.
- Lumpkins Jail= All concurred it should be evaluated under Criterion A as well as D.
- APE should not be expanded but rather dialogue on resources and eligibility will cover this issue.
- Dialogue on Memorial Park and City plans
- Additional consultation with NTHP and other consulting parties should occur.
- An on-site meeting would be helpful to understand scope.
- Should this area be considered a Traditional Cultural Property (TCP)? Under debate.

Dialogue included discussions on mitigation for effects. Preliminary concepts were floated around but it was agreed to hold off on more thorough conversations until after additional consultation.

The meeting ended at 2:00pm.

DHR Shockoe Update (DHR Project #2014-0666)

July 26, 2018; 1:30pm

Meeting Notes

Attendees:

Marc Holma- DHR
John Winkle- FRA
Emily Stock- DRPT
Nick Ruiz- DRPT
Carey Burch- Project Team
Karen Harrington- Project Team
Steve Walter- Project Team
Kerri Barile- Project Team
Emily Calhoun- Project Team

Held additional call regarding the ongoing dialogues regarding Shockoe Bottom including more on the National Trust for Historic Preservation (NTHP) letter (dated July 20).

DHR confirmed that there is no recorded archaeological district in Shockoe regarding the slave trade at this time. In addition, archaeology done to date on burial site has not revealed any burials. Archaeology has been done on Lumpkins Jail, but it was never evaluated for the NRHP. If it was evaluated, it would likely be eligible under A and D. As such, DHR suggests adding Lumpkins to the indirect APE but not adding the burial ground.

John Winkle stated that the FRA will assure that the process is followed but is letting DHR take the lead on eligibility and APE.

Regarding Lumpkins, DHR suggested evaluating its setting and feeling to determine effects. DHR and FRA discussed induced impacts and its potential place (or not) in the process. This is particularly true for 4(f). A long dialogue on the project and 4(f) ensued.

DHR reiterated that the APE should not be expanded (here or elsewhere) unless it is justified but to be sure that all criteria are evaluated.

All concurred that consultation should be ongoing with all MOA signatories as well as all consulting parties and vested groups. A broad conversation is imperative.

DHR stated that a second amendment to the project effects should be submitted once the roster of historic properties is finalized.

The meeting ended at 2:00pm.

ACHP Shockoe Update
July 27, 2018; 8:30am

Meeting Notes

Attendees:

Sarah Stokely- ACHP
Kerri Barile- Project Team

Held additional call regarding the ongoing dialogues regarding Shockoe Bottom including more on the National Trust for Historic Preservation (NTHP) letter (dated July 20).

Sarah discussed the Memorial Park and Shockoe in general. Kerri Barile answered questions on various groups, ongoing consultation, and the history of the area. It was agreed that the NTHP may help facilitate dialogues with various groups in this area. The ACHP wants to continue to be involved in any future dialogues.

APE was discussed including how it was defined, modifications over time due to project changes and consulting party comments, and where it currently stands. ACHP concurs with DHR that the APE was done accurately and has been modified appropriately. It is possible that resources may be considered in the APE for various criteria, so will keep an eye out for that.

Sarah asked for additional information on the identification-level studies. Kerri Barile provided this data. The topic commenced as a general dialogue but then narrowed to Shockoe. ACHP concurred that the level of effort is commiserate with the undertaking. They emphasized the importance of this area. Project team concurs.

It was discussed that future meetings should include additional dialogues on Traditional Cultural Properties, memorialization, and, importantly, the City of Richmond’s plans for the area.

Sarah asked if any comparable TCPs had been found. Kerri said not to date.

A dialogue followed on indirect v. cumulative effects including the nature and scale of the undertaking and what is a reasonable and foreseeable impact based on this.

The meeting ended at 9:00am.

FRA TCP Update
July 31, 2018; 2:00pm

Meeting Notes

Attendees:

John Winkle- FRA
Randy Selleck- DRPT
Carey Burch- Project Team
Kerri Barile- Project Team
Emily Calhoun- Project Team

Held call with FRA to discuss the definition of a Traditional Cultural Property (TCP) and how this concept may or may not relate to the Shockoe area and the slave trade.

Kerri Barile provided an update on the various calls with DHR and ACHP over the past few weeks as well as summarizing the issues at hand. John Winkle asked if the project would be physically impacting the sites, and Kerri said no. A dialogue on expanding eligibility to include Criterion A ensued. The discussion included TCPs, existing districts in Shockoe and how various sites fit/don't fit in the districts.

All agreed that an on-site meeting would help answer questions. Consulting parties and other vested groups should be invited. A discussion on the previous calls and meetings and future calls and meetings were discussed to assure appropriate and thorough public outreach.

The meeting ended at 2:30pm.

DC TO RICHMOND
SOUTHEAST HIGH SPEED RAIL

801 E. Main St., Suite 1000
Richmond, VA 23219

FRA Shockoe Update
August 3, 2018; 2:00pm

Meeting Notes

Attendees:

Marc Holma- DHR
Kerri Barile- Project Team

Held call with DHR to discuss ACHP and FRA calls on Shockoe Bottom.

DHR and ACHP held a call as well to assure process is followed, and they both concur that it has.

Marc and Kerri discussed next steps with eligibility and effect based on feedback, including what sites to add to the APE, which ones to not include, the area as a Traditional Cultural Property (TCP), and role of FRA, ACHP, DHR and consulting parties.

Marc stated that the DHR is having additional meetings on the TCP concern and would have an answer for the team next week.

The DHR concurred that Lumpkins Jail should be considered to be eligible under A and D.

Paths forward were discussed including a multitude of scenarios. Kerri also provided an update on the various meetings in the works, including a meeting with the City of Richmond and the on-site consulting party meeting.

The meeting ended at 2:30pm.

DC TO RICHMOND
SOUTHEAST HIGH SPEED RAIL

The meeting ended at 9:30am.

801 E. Main St., Suite 1000
Richmond, VA 23219

Project Signtories Update
October 2, 2018; 9am

Meeting Notes

Attendees:

John Winkle- FRA
Sarah Stokely- ACHP
Emily Stock- DRPT
Carey Burch- Project Team
Kerri Barile- Project Team
Absent= Marc Holma- DHR

Kerri Barile provided an overview of the three upcoming consulting party meetings- one in DC, one in Fredericksburg, and one in Richmond. The Richmond meeting has an on-site component. Sarah Stokely asked if she should attend the DC meeting; Kerri stated that the Richmond meeting was likely more crucial given the issues there.

Kerri Barile provided an update on various issues as provided to her by Marc Holma at the DHR (since he couldn't be on the call). She also provided some preliminary thoughts on the cadence of the meeting in Richmond. Team concurred with agenda organization and suggested sending the agenda out in advance. All agreed that there are two goals of the meeting: to provide data on the project including a visual reference for the minimal project impacts and to gather feedback from consulting parties on historic properties, effects, and significance. It is important that invitees can voice their thoughts. Consultation allows all parties to bring up issues.

John Winkle stated that he will be in attendance and help answer questions from a FRA perspective but he was going to let the cultural resource team take priority.

The dialogue also included information on a response to the National Trust's letter. Emily Stock stated that it is in progress and the City's letter on preservation in the area is forthcoming. The group discussed several items presented in their letter, including APE, Traditional Cultural Properties, and indirect v. cumulative effects.

Sarah Stokely stated that work to date has included all reasonable and foreseeable impacts and has met 106. The team should continue good will efforts to understand all impacts outside of the current project for context. Emily Stock concurred and said that continuing a good dialogue with the City is very important as well as hearing from VDOT and local groups on their plans for the area.

Sarah Stokely followed up by asking information on other projects that we know of that are slated for the area. Emily Stock and Carey Burch provided data. The team also specifically discussed the status of the Memorial Park project so we can be aware of the parameters prior to our meeting.

Kerri Barile said she will provide copies of handouts and agenda to signatories before the Shockoe/Richmond meeting.

The meeting ended at 9:45am.

DC TO RICHMOND
SOUTHEAST HIGH SPEED RAIL

801 E. Main St., Suite 1000
Richmond, VA 23219

Signatories Update (DHR, ACHP, FRA, DRPT)
October 23, 2018; 2:00pm

Meeting Notes

Attendees:

Emily Stock- DRPT
Randy Selleck- DRPT
Marc Holma- DHR
Sarah Stokley- ACHP
Jaime Lochinger- ACHP
(absent John Winkle- FRA)
Carey Burch- Project Team
Kerri Barile- Project Team

- Held call to provide a summary on the consulting party meetings held in October, including in-person meetings and conference calls, and finalize determinations on several key issues.

- Kerri Barile provided a summary of the issues at hand and meetings. She included a summary that all dialogues held to date suggest including Lumpkins Jail and the Graveyard for Free People of Color and Slaves (off Hospital Street) in the list of historic properties and assuming eligibility of both resources under Criteria A and D. The Burial Ground for Negros (located NW of Main Street Station) is not being included as there is no evidence of the site. Marc Holma asked for a clarification on the DHR’s eligibility position regarding the Graveyard for Free People of Color and Slaves, and Kerri Barile stated that it was recorded during the archaeological study for the project in 2018 and the team stated that the resource is potentially eligible but the portion of the site within the APE does not contribute to the overall eligibility. Regardless, the team has elected to assume eligibility for the whole site at the request of the consulting parties. The DHR concurred. Sarah Stokley confirmed that both sites would be eligible under A as well as D and said that this approach sounded outstanding. Jaime Lochinger said she was happy to hear this outcome and it makes sense.

- Sarah Stokley followed with additional questions on how the integrity of Lumpkins Jail was evaluated. Kerri Barile outlined the archaeological work to date and the viewshed images collected. Kerri Barile and Marc Holma also brought up NPS archaeological Bulletin and how it was carefully examined for sites eligible under criteria other than D.

- Marc Holma brought up the Burial Ground for Negros again and asked if the ACHP concurred that it should not be included in the APE. Jaime Lochinger stated that if there is a rational backing for this decision and it was made in good faith, which it sounds like it was, then they are good with it. Sarah Stokley asked for a reminder on whether or not the piers are visible from this resource. Marc Holma said they are not. Sarah Stokley suggested that we provide a map showing the site, APE and info on visuals on why this site was not included as it is not visible from the project limits of disturbance.

- Kerri Barile followed up with additional data beyond viewshed, stating again that there is no physical evidence of the Burial Ground despite numerous attempts to locate it. Marc Holma concurred and said that VDOT has specifically looked for it at least three times and has found no evidence.

- To summarize dialogue on APE, Kerri Barile asked if the ACHP and DHR are good with the APE as defined. Both stated that they are as it sounds like it was determined reasonably and with good faith.

- Sarah Stokley asked if there would be a conference call with the NTHP. Kerri Barile said yes. Once a reply letter goes to the NTHP, would have a call with them, Preservation Virginia, and HRF as they have a stake in Shockoe. Kerri has reached out to all other consulting parties individually to talk about the mitigation.

- Regarding Traditional Cultural Properties (TCPs), Jaime Lochinger said that the team is already looking at this area as a historic district, as it is part of the Shockoe Valley and Tobacco Row HD and all sites are being assumed to contribute to the eligibility of the district. If the area is not being defined as a TCP, just need to be sure to state this and why not clearly to all consulting parties. Sarah Stokley followed up that this is one of many comments brought up by consulting parties and we should handle it like other comments. Present info on why it was considered and the outcome of the analysis with a determination.

- Marc Holma stated that the DHR still believed that it does not qualify.

- Sarah Stokley said that considering sites under Criterion A and assuming that they contribute to the existing district makes sure that they are considered in the dialogue and 106 process and addresses concerns raised by consulting parties. This is a good faith effort. Both she and Marc Holma said it is up to FRA and DRPT at this point to craft their argument and present it for their concurrence. But this issue needs to be decided now; it cannot be mitigation.

- Sarah Stokley then asked for a broader dialogue on indirect and cumulative effects. Emily Stock and Kerri Barile discussed the City's letter and their projects in this area. Jaime Lochinger said all dialogues should be documented in an administrative record to show due diligence.

- Kerri Barile summarized next steps= letter to National Trust as a reply, conference call regarding Shockoe, information on final list of historic properties to all consulting parties, revised effect to DHR. Jaime Lochinger asked if consulting parties have received any effect documents to date, and Kerri Barile said yes. They received the original letter sent in June and the addendum sent in July. They will also get this second addendum.

- Regarding effects, Jaime asked if we are doing an overall project effect or property by property. Kerri Barile and Marc Holma said both and described the process they have been using for Virginia rail. Jaime said she is relieved and thankful for the extensive and ongoing consultation between the team and the DHR.

The meeting ended at 3pm.

RE: Archaeological Resource Eligibility/ Phase IB Archaeological Study of the Preferred Alternative Limits of Disturbance
Southeast High Speed Rail Project, Washington, D.C. to Richmond Segment
DHR #2014-0666

Dear Marc,

The Federal Railroad Administration (FRA) and the Virginia Department of Rail and Public Transportation (DRPT) are continuing environmental studies associated with the Tier II Environmental Impact Statement (EIS) for the Washington, D.C. to Richmond segment of the Southeast High Speed Rail (DC2RVA) corridor (Project). The limits of the Project extend from Control Point RO (MP CFP-110) in Arlington south to the CSX Transportation ("CSXT") A-Line/CSXT-S-Line junction at MP A-11 in Centralia, Virginia (Chesterfield County), a distance of approximately 123 miles.

This project is receiving federal funding through the FRA, requires permits issued by federal agencies such as the U.S. Army Corps of Engineers, and will traverse federal land including parcels owned by the U.S. Marine Corps and the National Park Service, among others. Due to the involvement of these and several other federal entities, the undertaking requires compliance with the National Environmental Policy Act (NEPA) and Section 106 of the National Historic Preservation Act (NHPA), as amended. The FRA sent your office a project initiation letter on December 11, 2014, formally commencing the Section 106 process, and the project's area of potential effects (APE) was approved by the State Historic Preservation Officer (SHPO) on February 2, 2015, as required by 36 CFR 800.4(a)(1).

Phase IA and Phase IB archaeological studies on the majority of the main line and alternatives were coordinated with your office between 2015 and 2016. Since that time, a Draft Environmental Impact Statement (EIS) was produced and a Preferred Alternative has been recommended by DRPT and the Commonwealth Transportation Board. Subsequent engineering associated with the Preferred Alternative has resulted in a slightly expanded limit of disturbance (LOD) to accommodate further improvements and modifications to proposed rail infrastructure and associated road crossings. The expanded LOD areas were not included in the original archaeological studies. As such, additional archaeological Phase IB surveys were completed on all areas where the project APE was expanded due to these changes.

Enclosed please find one hard copy and one electronic copy of the report entitled *Phase IB Archaeological Survey for the Washington, D.C. to Richmond, Virginia High Speed Rail Project - Preferred Alternative Limits of Disturbance*. The report was authored by Kevin McCloskey, Emily Calhoun, Kerry González, and Mike Klein with Dovetail Cultural Resource Group (Dovetail), a member of the DC2RVA Project Team. The report meets all standards set forth in both the Secretary of Interior's Standards and Guidelines (1983) and the Virginia Department of Historic Resource's (DHR) *Guidelines for Preparing Identification and Evaluation Reports* (2011).

The archaeological study consisted of a pedestrian survey and subsurface testing, supplemented by metal detector survey, throughout the APE beyond the limits of previous Phase IB investigations. Based on the pedestrian survey, subsurface testing (and, where necessary, metal detection) was carried out in locations deemed to have potential for intact subsurface deposits. Additionally, all sites within the APE not addressed by the previous DC2RVA Phase IB archaeological study and determined eligible or potentially eligible for listing in the National Register of Historic Places (NRHP), as well as those previously recorded sites that had not been evaluated by the DHR, were examined regardless of their location within areas identified for archaeological testing. The archaeological areas subjected to Phase IB study, inclusive of pedestrian and subsurface testing, encompass 158.8 acres (64.3 ha).

Pedestrian surveys found that the majority of the archaeological APE was disturbed by buried utility corridors, modern development, and grading associated with the railroad. Despite these disturbances, a total of 511 shovel test pits (STPs) was excavated across the APE. The excavation of shovel tests and metal detector hits resulted in the recovery of 140 artifacts that date predominantly to the historic period. Phase IB surveys resulted in the identification of 23 archaeological sites and 5 isolated finds within the surveyed portions of the APE. Of these 23 archaeological sites, 17 were previously identified archaeological sites and 6 were newly recorded. Based on the current studies, it is recommended that:

- Sites 44CF0680 (Fort Darling/Centralia Earthworks) remains eligible for listing in the NRHP under Criteria A and C, but that the portion of this site within the APE does not contribute to the overall site eligibility;
- Nine sites (44HE0357, 44HE1097, 44HE1098, 44HE1094, 44SP0187, 44SP0468, 44SP0687, 44SP0688, and 44ST1223) are recommended potentially eligible for listing in the NRHP under Criterion D;
- Nine sites (44CF0022, 44CF0123, 44CF0260, 44HE1203, 44HE120, 444PW1008, 44ST0011, 44ST0270, and 44ST0271) remain unevaluated as the majority of each of these sites lies outside

of the project APE, but the limited portions of these sites within the APE have been destroyed or severely compromised and as such they do not contribute to their respective site's overall eligibility; and

- Four sites (44HE1202, 44SP0768, 44SP0767, and 44ST1224) and the five isolated finds (no numbers assigned) are recommended not eligible for NRHP listing. However, sites 44SP0768 and 44ST1224 are both small family cemeteries that have not been fully delineated, so they should be avoided or delineated.

We invite your agency to concur with these recommendations within 30 days of receipt of this letter. If you have questions about archaeological studies for this project, please do not hesitate to contact me or Emily Calhoun at (540) 899-9170 or via email at kbarile@dovetailcrg.com/ecalhoun@dovetailcrg.com .

Sincerely,

Kerri S. Barile, Ph.D.

The Virginia SHPO concurs that the following resource continues to be eligible for the NRHP, as recorded during the DC2RVA/Phase IB Archaeological Study of the Preferred Alternative LOD (DHR #2014-0666); however, the portion of this site within the APE does not contribute to its overall eligibility:

44CF0680	Fort Darling/Centralia Earthworks (Criteria A and C)

They further concur that the following resources are potentially eligible for the NRHP:

44HE0357	Privy/Pit Complex (Criterion D)
44HE1097	Railroad Warehouse (Criterion D)
44HE1098	Railroad Site (Criterion D)
44HE1094	Commissary Warehouse (Criterion D)
44SP0187	Marye's Mill (Criterion D)
44SP0468	Jackson's Earthwork-Encampment (Criteria A and D)
44SP0687	Fredericksburg Block 48 (Criterion D)
44SP0688	Fredericksburg Block 49 (Criterion D)
44ST1223	Civil War Campsite (Criterion D)

They also concur that the following resources remain unevaluated as the portions of each site within the project APE are minimal, thus not allowing for a full evaluation currently; in addition, the portion of each site in the APE does not contribute to its overall eligibility:

44CF0022	Lithic Scatter; Archaic through Woodland
44CF0123	Camp and Dwelling; Early Woodland and Nineteenth Century
44CF0260	Lithic Scatter; Unknown Prehistoric
44HE1203	Cemetery: "Grave Yard for Free People of Color and Slaves"; Nineteenth Century
44HE1204	Carrington's Mill; Early-Nineteenth Century
44PW1008	Indeterminate Type or Age
44ST0011	Indeterminate; Unknown Prehistoric and Colonial
44ST0270	Civil War Camp; Nineteenth Century
44ST0271	Civil War Camp; Nineteenth Century

Lastly, they concur that the following resources are not eligible for the NRHP:

44HE1202	Artifact Scatter; Twentieth Century
44ST1224/089-5624	Daffan Family Cemetery; Mid-Nineteenth Century
44SP0768/088-5511	Family Cemetery; Twentieth Century
44SP0767/088-5516	Civil War Earthwork; Nineteenth century

Re: Request for Permit to Conduct Archaeological Investigations on State-Controlled Land
Southeast High Speed Rail Project - DC2RVA Section
Leesylvania State Park, Prince William County, VA
DHR File No. 2014-0666

Dear Ms. Barile:

Thank you for your request for permission to conduct field investigations on state-controlled lands. Find enclosed the requested permit. This permit is valid for the investigations as described in the approved research design. Please be aware that there are several conditions that must be met to satisfy the permit requirements, and these are listed in the permit.

The permit is valid for a period of one year dating from February 20, 2018. According to the stipulations of the permit, a final report of all investigations is due in the Department by February 20, 2019. This report should thoroughly document the findings of this archaeological work and provide recommendations on the need for and scope of additional work.

Should there be extenuating circumstances that make you unable to meet the conditions of this permit, please contact the Department. If you have any questions concerning the stipulations of the permit, or if we may provide any further assistance, please do not hesitate to contact me at roger.kirchen@dhr.virginia.gov.

Sincerely,

Roger W. Kirchen, Director
Review and Compliance Division

Re: Permit to Conduct Archaeological Investigations on State-Controlled Land
Southeast High Speed Rail Project - DC2RVA Section
Leesylvania State Park, Prince William County, VA
DHR File No. 2014-0666

Dear Ms. Barile:

Thank you for your request for permission to conduct field investigations on state-controlled lands. In accordance with §10.1-2300 of the *Code of Virginia*, the Virginia Antiquities Act, effective July 1, 1989, the Department of Historic Resources ("Department") on this 20th day of February, 2018 hereby grants to Kerri Barile ("Permittee") of the Dovetail Cultural Resource Group permission to conduct archaeological investigations at Leesylvania State Park in Prince William County in support of the Southeast High Speed Rail Project - DC2RVA Section. This permit is to be considered effective as of today's date.

The granting of this permit signifies that:

1. The Department finds that granting the permit is in the best interests of the Commonwealth;

2. The Department finds that the archeologist selected to perform the work is qualified pursuant to §10.1-2302(B) of the *Code of Virginia* to conduct these investigations;

3. The Department has received from the Permittee acknowledgement that all materials resulting from the study, including artifacts, field records and photographs, are the property of the Commonwealth of Virginia in accordance with §10.1-2302(C); and

4. The Department has received from the Permittee and has approved, pursuant to §10.1-2302(D), a statement detailing the goals and objectives of the project and the proposed research strategy.

Western Region Office
962 Kime Lane
Salem, VA 24153
Tel: (540) 387-5443
Fax: (540) 387-5446

Eastern Region Office
2801 Kensington Avenue
Richmond, VA 23221
Tel: (804) 367-2323
Fax: (804) 367-2391

This permit is granted subject to the following conditions:

1. The Permittee shall ensure that the proposed field investigations are carried out in strict accordance with the approved research statement referred to in Item 4 above, or shall obtain the prior written approval of the Department for any change;

2. The Permittee shall ensure that the Department is informed in writing of the initiation and completion of field work, and allow inspections by representatives or designees of the Department as determined necessary by the Department;

3. The Permittee shall ensure that, at the conclusion of the project, a Virginia State Archaeological Site Inventory form is completed for any identified site or updated for existing sites. All inventory forms shall be submitted to the Department in an electronic format consistent with the Department's Virginia Cultural Resource Information System (VCRIS) at the end of the field investigations and prior to submission of any technical reports;

4. The Permittee shall ensure that a technical report of the investigations is prepared upon completion of all field investigations under this permit. The report shall meet the federal standards entitled *Archeology and Historic Preservation: Secretary of the Interior's Standards and Guidelines* (48 FR 44716-44742, September 29, 1983) and the Department's *Guidelines for Conducting Historic Resources Survey in Virginia* (rev. 2017). One bound hardcopy and one digital copy of the report shall be submitted to the Department for review and comment;

5. All artifacts recovered as a consequence of the investigations conducted under this permit shall be placed in the collections of the Department upon completion of the study and shall be curated (with the exception of any items used for appropriate exhibit purposes) in accordance with the Department's *State Curation Standards*;

6. The archeologist selected to perform the work shall carry a copy of the permit during all fieldwork;

7. The Permittee shall consult with the Department in the event that human remains are identified during work performed under this permit;

8. The Department reserves the right to revoke this permit upon the initiative of the Director, or upon the request of any interested party for violations of any of the above conditions, or if good cause is demonstrated; and

9. This permit shall be valid for one year from the date of issuance. This permit is not transferable.

If you have any questions regarding this permit and its conditions, or if you require any further assistance, please do not hesitate to contact Roger Kirchen of our project review division at email roger.kirchen@dhr.virginia.gov.

Sincerely,

Julie V. Langan

RE: Resource Eligibility/ Reconnaissance Studies on Limits of Disturbance
Southeast High Speed Rail (DC2RVA) Project, Washington, D.C. to Richmond Segment
DHR #2014-0666

Dear Marc,

The Federal Railroad Administration (FRA) and the Virginia Department of Rail and Public Transportation (DRPT) are continuing environmental studies associated with the Tier II Environmental Impact Statement (EIS) for the Washington, D.C. to Richmond segment of the Southeast High Speed Rail (DC2RVA) corridor (Project). The limits of the Project extend from Control Point RO (MP CFP-110) in Arlington south to the CSX Transportation ("CSXT") A-Line/CSXT-S-Line junction at MP A-11 in Centralia, Virginia (Chesterfield County), a distance of approximately 123 miles.

This project is receiving federal funding through the FRA, requires permits issued by federal agencies such as the U.S. Army Corps of Engineers, and will traverse federal land including parcels owned by the U.S. Marine Corps and the National Park Service, among others. Due to the involvement of these and several other federal entities, the undertaking requires compliance with the National Environmental Policy Act (NEPA) and Section 106 of the National Historic Preservation Act (NHPA), as amended. The FRA sent your office a project initiation letter on December 11, 2014, formally commencing the Section 106 process, and the project's area of potential effects (APE) was approved by the State Historic Preservation Officer (SHPO) on February 2, 2015, as required by 36 CFR 800.4(a)(1).

Reconnaissance architectural studies on the majority of the main line and alternatives were coordinated with your office between 2015 and 2017. Since that time, a Draft Environmental Impact Statement (EIS) was produced and a Preferred Alternative has been recommended by DRPT and the Commonwealth Transportation Board. Subsequent engineering associated with the Preferred Alternative has resulted in a slightly expanded limit of disturbance (LOD) to accommodate further improvements and modifications to proposed rail infrastructure and associated road crossings. The expanded LOD areas were not included in the original architectural reconnaissance study. As such, additional architectural identification-level surveys were completed on all areas where the project APE was expanded due to these changes. A meeting on the results of these additional architectural identification-level surveys was held at your office on April 4, 2018, and the enclosed report summarizes this dialogue and the project results.

Enclosed please find two hard copies and one electronic copy of the report entitled *Addendum: Architectural Reconnaissance Survey of the LOD Expansion Area for the Washington, D.C. to Richmond, High Speed Rail Project, Arlington, Caroline, Chesterfield, Hanover, Henrico, Fairfax, Prince William, Stafford, and Spotsylvania Counties and the Cities of Alexandria, Fredericksburg, and Richmond, Virginia*. The report was authored by Adriana T. Moss and Kerri S. Barile with Dovetail Cultural Resource Group (Dovetail), a member of the DC2RVA Project Team. The report meets all standards set forth in both the Secretary of Interior's Standards and Guidelines (1983) and the Virginia Department of Historic Resource's (DHR) *Guidelines for Preparing Identification and Evaluation Reports* (2011).

In total, the DC2RVA Project Team surveyed 352 historic architectural resources—124 previously recorded and 228 newly recorded properties. Two resources were previously listed in the NRHP, and it is recommended that both remain listed: Rippon Lodge (076-0023) and the Town of Barton Heights Historic District (127-0816). Although Rippon Lodge is outside of the prescribed APE, it is within the direct viewshed of the rail crossing at Neabsco Creek where a new bridge is proposed.

Eleven properties are recommended potentially eligible for the NRHP based on the current survey. The East Rosemont Historic District (100-5341) is located in Alexandria, just east of the NRHP-listed Rosemont Historic District (100-0137). In consultation with the City of Alexandria Planning Department, it was decided to record this area as a new district rather than an expansion of the original district as they were platted at separate times and have unique design characteristics. Six of the 11 potentially eligible resources are located within the NRHP-listed Fredericksburg Historic District (111-0132). As such, they are all recommended to be individually potentially eligible as well as contributing to the surrounding district: Chancellor House (111-0013/111-0132-0508), Hackley-Monroe House/James Monroe House/Joseph Jones House (111-0038/111-0132-0509), Dr. Charles Mortimer House at 213 Caroline Street (111-0067/111-0132-0505), the 1770 House (111-0132-0126), Shiloh Baptist Church (New Site) (111-0132-0147), and Robert Adams Residence (111-0132-0458).

Loving's Produce Company (127-0344-0102) is located in the NRHP-listed Shockoe Valley and Tobacco Row Historic District (127-0344). It is recommended potentially eligible as both an individual resource and as a contributing element to the district. Similarly, the Hanover County School Board (166-5073-0024) building, located in the previously determined potentially eligible district, Berkleytown Historic District (166-5073), is also recommended to both contribute to its surrounding district but also be potentially individually eligible for the NRHP. The remaining two resources that are recommended to be potentially eligible are not located in a district: Philip Morris Operations Complex (127-5818) and Gilpin Court Apartment Complex (127-6883), both in Richmond.

One resource, Hoopers (042-0556) in Hanover County, was not accessible during the current survey. As such a recommendation on potential eligibility could not be rendered. It is recommended that further study be completed to acquire additional data, resulting in an NRHP recommendation.

The remaining 338 resources are recommended not individually eligible for the NRHP, although 126 of these properties are recommended to be contributing elements to surrounding eligible or NRHP-listed historic districts: Rosemont Historic District (100-0137), East Rosemont Historic District (100-5341), Boundary Markers of the Original District of Columbia (000-0022), Fredericksburg Historic District (111-0132), Berkleytown Historic District (166-5073), Laurel Industrial School Historic District (043-0292), Town of Barton Heights Historic District (127-0816), Seaboard Air Line Railroad Corridor (127-5271), and Richmond, Fredericksburg & Potomac Railroad (500-0001). A full list of each resource and its corresponding district is attached.

We invite your agency to concur with these recommendations within 30 days of receipt of this letter. If you have questions about historic property studies for this project, please do not hesitate to contact me or Adriana Moss at (540) 899-9170 or via email at kbarile@dovetailcrg.com or amoss@dovetailcrg.com.

Sincerely,

Kerri S. Barile, Ph.D.
President, Dovetail Cultural Resource Group

The Virginia SHPO concurs that the following resources continues to be listed in the NRHP, as recorded during the DC2RVA/LOD study (DHR #2014-0666):

076-0023	Rippon Lodge (Criteria A & B)
127-0816	Town of Barton Heights Historic District (Criteria A & C)

They further concur that the following resources are individually potentially eligible for the NRHP and are contributing elements to the Fredericksburg Historic District (111-0132):

111-0013/111-0132-0508	Chancellor House (Criteria A, B, & C)
111-0038/111-0132-0509	Hackley-Monroe House/James Monroe House/Joseph Jones House (Criterion C)
111-0067/111-0132-0505	Dr. Charles Mortimer House at 213 Caroline Street (Criteria B & C)
111-0132-0126	The 1770 House (Criterion C)
111-0132-0147	Shiloh Baptist Church (New Site) (Criterion A and Criteria Consideration A)
111-0132-0458	Robert Adams Residence (Criterion C)

They also concur that the following resource is individually potentially eligible and is a contributing element to the Shockoe Valley and Tobacco Row Historic District (127-0344):

127-0344-0102 Loving's Produce Company (Criterion A)

They concur that the following resource is individually potentially eligible and is a contributing element to the Berkleytown Historic District (166-5073):

166-5073-0024 Hanover County School Board (Criteria A & C)

They also concur that the following resources are individually potentially eligible for the NRHP but do not contribute to a historic district:

100-5341	East Rosemont Historic District (Criterion C)
127-5818	Philip Morris Operations Complex (Criterion C and Criteria Consideration G)
127-6883	Gilpin Court Apartment Complex (Criterion A)

The SHPO concurs that the following resource requires additional study as it was not accessible during the current survey:

042-0556	Hoopers (unknown criteria)

They further concur that the following resources are not individually eligible but contribute to the Rosemont Historic District (100-0137):

100-0137-0002	Water Commisioner's House, 4 W. Cedar Street
100-0137-0004	Murtagh House, 6 W. Cedar Street
100-0137-0006	Sidley House, 8 W. Cedar Street
100-0137-0008	Jackson House/Gartlam House, 10 W. Cedar Street
100-0137-0010	Harris House/Nazzaro House, 12 W. Cedar Street
100-0137-0029	Townhouse, 67, 69, and 71 Commonwealth Avenue
100-0137-0030	Townhouse, 73, 75, and 77 Commonwealth Avenue
100-0137-0033	Townhouse, 103, 105, and 107 Commonwealth Avenue
100-0137-0227	Marsh House/Burns House, 11 Russell Road
100-0137-0258	Alexandria Lodgings, 10 Sunset Drive
100-0137-0261	The Fisher House, 14 Sunset Drive
100-0137-0263	Double House, 16-18 Sunset Drive
100-0137-0265	The Grant House, 20 Sunset Drive
100-0137-0268	The Yowell House, 24 Sunset Drive
100-0137-0270	Apartment Building, 26 Sunset Drive
100-0137-0273	The Stickley House/The Czekalski House, 30 Sunset Drive
100-0137-0274	The Harrison House, 90 Commonwealth Avenue
100-0137-0314	Condominiums, 3 Russell Road

They also concur that the following resources are not individually eligible but contribute to the East Rosemont Historic District (100-5341):

100-5345	House, 128 E. Walnut Street
100-5346	Duplex, 126 E. Walnut Street
100-5347	Duplex, 124 E. Walnut Street
100-5348	House, 120 E. Walnut Street
100-5349	House, 118 E. Walnut Street
100-5350	House, 129 E. Walnut Street
100-5351	House, 127 E. Walnut Street

100-5352	House, 125 E. Walnut Street
100-5353	House, 123 E. Walnut Street
100-5354	House, 121 E. Walnut Street
100-5355	House, 119 E. Walnut Street
100-5356	House, 117 E. Walnut Street
100-5357	House, 115 E. Walnut Street
100-5358	House, 113 E. Walnut Street
100-5359	Duplex, 400-402 Mt. Vernon Avenue
100-5360	Duplex, 122-124 E. Maple Street
100-5361	House, 120 E. Maple Street
100-5362	House, 118 E. Maple Street
100-5366	House, 110 E. Maple Street
100-5367	House, 108 E. Maple Street
100-5368	Duplex, 121-123 E. Maple Street
100-5369	Duplex, 117-119 E. Maple Street
100-5370	House, 115 E. Maple Street
100-5371	House, 113 E. Maple Street
100-5372	House, 111 E. Maple Street

100-5397	Multi-Family, 22-32 Mt. Vernon Avenue

They concur that the following resources is not individually eligible but contributes to the Boundary Markers of the Original District of Columbia (000-0022):

000-0022-0003	Southwest No. 2 Boundary Marker, Russell Road at King Street

They further concur that the following resources are not individually eligible but contribute to the Fredericksburg Historic District (111-0132):

111-0132-0131	House, 302 Princess Anne Street
111-0132-0132	House, 304 Princess Anne Street
111-0132-0454	Claiborne Wigglesworth House, 522 Caroline Street
111-0132-0455	Elisha Dickenson Single Dwelling, 524 Caroline Street
111-0132-0457	House, 526 Caroline Street
111-0132-0459	Single dwelling, 529 Caroline Street
111-0132-0460	Commercial Building, 531 Caroline Street
111-0132-0507	Dr. Charles Mortimer House, 216 Caroline Street
111-0132-0524	House, 203 Princess Elizabeth Street
111-0132-0525	House, 204 Princess Elizabeth Street
111-0132-0526	House, 205 Princess Elizabeth Street
111-0132-0527	James N. Turner House, 207 Princess Elizabeth Street
111-0132-0528	House, 209 Princess Elizabeth Street
111-0132-0686	House, 100 Wolfe Street
111-0132-0687	Robert Ellis House, 102 Wolfe Street
111-0132-0688	Single dwelling, 104 Wolfe Street
111-0132-0689	Single Dwelling, 106 Wolfe Street
111-0132-0690	Wolfe Street Tenement House/House, 108 Wolfe Street

They also concur that the following resources are not individually eligible but contribute to the Berkleytown Historic District (166-5073):

166-5073-0018	House, 105 School Street
166-5073-0019	House, 101 School Street
166-5073-0020	House, 706 Henry Street
166-5073-0021	House, 708 Henry Street
166-5073-0022	House, 704 Henry Street
166-5073-0023	House, 109 Berkley Street
166-5073-0025	House, 616 Henry Street

The SHPO concurs that the following resources are not individually eligible but contribute to the Laurel Industrial School Historic District (043-0292):

043-0292-0002	Infirmary, 2915 Hungary Road
043-0292-0004	House, 2911 Hungary Road
043-0292-0005	Administrative Offices/Teacher's Quarters, 2909 Hungary Road

They also concur that the following resources are not individually eligible but contribute to Town of Barton Heights Historic District (127-0816):

127-0816-0001	Apartments, 200 Wellford Street
127-0816-0002	Apartments, 202 Wellford Street
127-0816-0003	Apartments, 204 Wellford Street
127-0816-0004	House, 209 Wellford Street
127-0816-0005	House, 207 Wellford Street
127-0816-0006	House, 205 Wellford Street
127-0816-0007	House, 203 Wellford Street
127-0816-0017	House, 203 Minor Street
127-0816-0027	House, 101 Yancey Street
127-0816-0030	House, 1 Poe Street
127-0816-0031	House, 3 Poe Street
127-0816-0065	House, 1604 Monteiro Street
127-0816-0066	House, 1606 Monteiro Street
127-0816-0067	Apartments, 1608 and 1610 Monteiro Street
127-0816-0068	Apartments, 1612 and 1614 Monteiro Street
127-0816-0069	House, 1620 Monteiro Street

127-0816-0070	House, 1619 Monteiro Street
127-0816-0071	House, 1617 Monteiro Street
127-0816-0072	House, 1613 Monteiro Street
127-0816-0073	House, 1611 Monteiro Street
127-0816-0074	House, 1609 Monteiro Street
127-0816-0087	House, 1706 Monteiro Street
127-0816-0088	House, 1708 Monteiro Street
127-0816-0089	House, 1710 Monteiro Street
127-0816-0090	House, 1716 Monteiro Street
127-0816-0091	House, 1705 Monteiro Street
127-0816-0092	House, 1800 Monteiro Street

They further concur that the following resources is not individually eligible but contributes to the Seaboard Air Line Railroad Corridor (127-5271):

020-5623	Bridge, Chippenham Parkway Bridge over SAL

They concur that the following resource is not individually eligible but contributes to the Richmond, Fredericksburg & Potomac (RF&P) Railroad Historic District (500-0001):

500-0001-0059	Possible RF&P Spur, Primmer House Road

Lastly, they concur that the following resources are not individually eligible and do not contribute to a historic district:

043-5869	Commercial Building, 9206 Old Staples Mill Road
043-5880	House, 9415 Wakefield Road
043-5881	Jones Flower Brokerage, 2603 Hungary Road
043-5910	House, 3002 Dumbarton Road
043-5911	House, 3000 Dumbarton Road
000-9818	DC Warehouse MA-134, off of Airport Access Road and Mt. Vernon Parkway
020-5392	Terminal Office, 5801 Jefferson Davis Highway
020-5409	House, 8219 Jefferson Davis Highway
020-5783	Air Liquide Industrial, 5901 Jefferson Davis Highway
020-5784	House, 2511 Elliham Avenue
020-5785	House, 2515 Elliham Avenue
020-5786	House, 2519 Elliham Avenue

020-5787	House, 2523 Elliham Avenue
020-5788	House, 2525 Elliham Avenue
020-5789	House, 2529 Elliham Avenue
020-5790	House, 2526 Elliham Avenue
020-5791	House, 2522 Elliham Avenue
020-5792	House, 2518 Elliham Avenue
020-5793	House, 2512 Elliham Avenue
042-5785	House, 11214-11220 Ashcake Road
042-5786	House, 11247 Ashcake Road
042-5787	House, 11239 Ashcake Road
042-5788	House, 12345 Hancock Place Lane
042-5789	House, 12341 Hancock Place Lane
042-5790	House, 12333 Hancock Place Lane
042-5791	Warehouse, 14174 Washington Hwy
043-0292-0003	House, 2913 Hungary Road
043-5467	Laurel Park Historic District
043-5865	House, 2912 Baird Street
043-5866	WMCI Apt Maintenance Building, 9310 Old Staples Mill Road
043-5867	House, 9302 Old Staples Mill Road
043-5868	House, 9300 Old Staples Mill Road
043-5870	Commercial Building, 9101 Old Staples Mill Road
043-5871	House, 2716 Hungary Road
043-5872	House, 2714 Hungary Road
043-5873	House, 2712 Hungary Road
043-5874	House, 2710 Hungary Road
043-5875	Laurel Park Methodist, 2700 Hungary Road
043-5876	House, 2513 Hungary Road
043-5877	House, 2501 Hungary Road
043-5878	House, 2505 Hungary Road
043-5879	House, 9413 Wakefield Road
043-5882	House, 2715 Hungary Road
043-5883	Cemetery, 2711 Hungary Road
043-5884	House, 2717 Hungary Road
043-5885	House, 2723 Hungary Road
043-5886	House, 9119 Mayfair Avenue
043-5887	House, 9117 Mayfair Avenue
043-5888	House, 9113 Mayfair Avenue

043-5889	Dam, N. of Hungary Road
043-5890	Commercial Building, Compton Road
043-5891	Commercial Building, 3906 Bremner Road
043-5892	House, 4007 Bremner Road
043-5893	House, 4004 Bremner Road
043-5894	House, 4005 Bremner Road
043-5895	House, 4002 Bremner Road
043-5896	House, 4003 Bremner Road
043-5897	House, 7606 Staples Mill Road
043-5898	House, 7604 Staples Mill Road
043-5899	Commercial Building, 7135 Staples Mill Road
043-5900	Hamlet Condominium Complex, 5600 Staples Mill Road
043-5901	House, 5500 Staples Mill Road
043-5902	House, 2 Point Pleasant Road
043-5903	House, 3106 Dumbarton Road
043-5904	House, 3104 Dumbarton Road
043-5905	House, 3100 Dumbarton Road
043-5906	House, 3028 Dumbarton Road
043-5907	House, 3008 Dumbarton Road
043-5908	House, 3006 Dumbarton Road
043-5909	House, 3004 Dumbarton Road
043-5912	House, 2917 Dumbarton Road
043-5913	House, 2923 Dumbarton Road
043-5914	House, 2925 Dumbarton Road
043-5915	House, 2927A Dumbarton Road
043-5916	House, 2927 Dumbarton Road
043-5917	House, 2929 Dumbarton Road
043-6057	House, 8103 Hermitage Road
043-6058	House, 8405 Broadway Avenue
076-5212	Commercial Building, 13426 Occoquan Road
076-5213	Commercial Building, 13428 Occoquan Road
076-5214	Commercial Building, 13441 Occoquan Road
076-5215	Restaurant, 13440 Occoquan Road
076-5838	Commercial Building, 13494 Jefferson Davis Highway
076-5890	Universal Dynamics Inc., 13600 Dabney Road
076-5891	Woodbridge Shopping Center LLC, 13562 Jefferson Davis Highway
089-0166	House, 151 Andrew Chapel Road

089-5605	House, 211 Andrew Chapel Road
089-5606	House, 85 Morton Road
100-0137-0259	Apartment Building, 12A and 12B Sunset Drive

RE: Reconnaissance architectural survey for SEHSR DC2RVA
VDHR File No. 2014-0666

Dear Dr. Barile:

The Department of Historic Resources (DHR) has received for our review and comment the report "ADDENDUM: Architectural Reconnaissance Survey for the LOD Expansion Area for the Washington, D.C. to Richmond Southeast High Rail (DC2RVA) Project" (May 2018) prepared by the DC2RVA Project Team and the associated Phase I (Reconnaissance Level) Virginia Cultural Resources Inventory System (V-CRIS) forms for the properties addressed in the report document. The current architectural survey is a result of a slightly expanded limit of disturbance (LOD) to accommodate further improvements and modifications to proposed rail infrastructure and associated road crossings. The expanded LOD areas were not included in the original architectural survey of the SEHSR DC2RVA corridor studies previously coordinated with DHR.

The consultant surveyed a total of 352 architectural properties fifty years old or older for the LOD expansion. Of these properties, 124 had been previously recorded while an additional 228 were newly inventoried. Please accept the follow as DHR's comments on the architectural Phase I survey, the resulting report, and the consultant's recommendations on the National Register of Historic Places (NRHP) eligibility for those architectural resources documented.

The DHR concurs that Rippon Lodge/Blackburn House (DHR Inventory No. 076-0023) and Town of Barton Heights Historic District (DHR Inventory No. 127-0816), which are both currently listed in the NRHP, retain their historic integrity and significance, and their NRHP listed status should not change. It should be noted that the consultant recommends that Southwest No. 2 Boundary Marker (DHR Inventory No. 000-0022-0003) is, according to Table 4-1 in the report, "Not Eligible; Contributing to Boundary Markers of the Original District of Columbia" (Report, page 4-2). Just to be clear, Boundary Markers of the Original District of Columbia is an NRHP-listed property, therefore, Southwest No. 2 Boundary Marker is currently in the NRHP. This is not specifically indicated in Table 4-1 with red highlight as is done for the other listed resources. We agree with the consultant that Southwest No. 2 Boundary Marker should remain a NRHP-listed property.

We also agree that the following properties are individually eligible for listing in the NRHP:

Hoopers (DHR Inventory No. 042-0556): This property was not accessible to the surveyor, therefore, it should be treated as potentially eligible until it can be properly recorded and its NRHP status assessed.

East Rosemont Historic District (DHR Inventory No. 100-5341): Eligible under Criterion C

Chancellor House (DHR Inventory No. 111-0013/111-0132-0508): DHR concurs that Chancellor House is individually eligible for listing in the NRHP; however, the reason for the recommendation is unclear. The report Table 4-1 states that the house is recommended eligible under Criteria A, B, and C while the V-CRIS form only discusses Criterion C. Please clarify the recommendation and revise either Table 4-1 or the V-CRIS form as necessary.

Dr. Charles Mortimer House (DHR Inventory No. 111-0067/111-0132-0505): Eligible under Criteria B and C.

The 1770 House (DHR Inventory No. 111-0132-0126): Eligible under Criterion C

Robert Adams Residence (DHR Inventory No. 111-0132-0458): Eligible under Criterion C

Gilpin Court Apartment Complex (DHR Inventory No. 127-6883): Eligible under Criterion A. This concurrence is only for the original buildings that date to 1942, not later phases of construction.

The DHR concurs that the properties listed below are not individually eligible for the NRHP, but contribute to the following NRHP-listed/eligible historic districts:

Contributing to Laurel Industrial School Historic District (DHR Inventory No. 043-0292): 043-0292-0002, 043-0292-0004, and 043-0292-0005

Contributing to Rosemont Historic District (DHR Inventory No. 100-0137): 100-0137-0002, 100-0137-0004, 100-0137-0006, 100-0137-0008, 100-0137-0010, 100-0137-0029, 100-0137-0030, 100-0137-0033, 100-0137-0227, 100-0137-0258, 100-0137-0261, 100-0137-0263, 100-0137-0265, 100-0137-0268, 100-0137-0270, 100-0137-0273, 100-0137-0274, and 100-0137-0314

Contributing to East Rosemont Historic District (DHR Inventory No. 100-5341): 100-5345, 100-5346 through 100-5362 (inclusive), and 100-5366 through 100-5397 (inclusive)

Contributing to Fredericksburg Historic District (DHR Inventory No. 111-0132): 111-0132-0131, 111-0132-0132, 111-0132-0454, 111-0132-0455, 111-0132-0457, 111-0132-0459, 111-0132-0460, 111-0132-0507, 111-0132-0524 through 111-0132-0528 (inclusive), and 111-0132-0686 through 111-0132-0690 (inclusive)

Contributing to Town of Barton Heights Historic District (DHR Inventory No. 127-0816): 127-0816-0001 through 127-0816-0007 (inclusive), 127-0816-0017, 127-0816-0027, 127-0816-0030, 127-0816-0031, 127-0816-0065 through 127-0816-0074 (inclusive), and 127-0816-0087 through 127-0816-0092 (inclusive)

Contributing to Berkleytown Historic District (DHR Inventory No. 166-5073): 166-5073-0018 through 166-5073-0023 (inclusive) and 166-5073-0025

Contributing to possible RF&P Historic District (DHR Inventory No. 500-0001): 500-0001-0059

Additionally, DHR concurs with the consultant that the following properties are not eligible for listing in the NRHP either individual or as contributing resources to any known historic district: 000-9818, 020-5409, 020-5783through 020-5793 (inclusive), 042-5785through 042-5791 (inclusive), 043-0292-0003, 043-5467, 043-5865 through 043-5917 (inclusive), 043-6058, 076-5212 through 076-5215 (inclusive), 076-5838, 076-5890, 076-5891, 089-0166, 089-5605, 089-5606, 100-0137-0259, 100-0137-0267, 100-0137-0272, 100-0158, 100-5363, 100-5364, 100-5365, 111-0132-0304, 111-0132-0426, 111-5434, 111-5435, 127-0009, 127-0344-0291, 127-0796, 127-0816-0028, 127-0816-0029, 127-0816-0061 through 127-0816-0064 (inclusive), 127-0816-0075, 127-0816-0076, 127-0816-0083through 127-0816-0086 (inclusive), 127-0835 through 127-0839 (inclusive), 127-6138, 127-6224, 127-6233, 127-6234, 127-6235, 127-6322, 127-6323, 127-6335, 127-6336, 127-6623, 127-6658, 127-7066 through 127-7078 (inclusive), 127-7143, 127-7144, 127-7145, 127-7157 through 127-7171 (inclusive), and 166-5083 through 166-5130 (inclusive)

With respect to the properties below, DHR disagrees with the consultant's NRHP eligibility recommendations and we offer the following comments:

Bridge over Seaboard Air Line, Chippenham Parkway (DHR Inventory No. 020-5623): DHR does agree that this structure is not individually eligible for listing in the NRHP; however, we also believe that it does not contribute to the Seaboard Line Railroad Corridor. The bridge was constructed independently of the railroad by another entity and is not associated with the history of the railroad.

Three duplexes along East Oak Street, City of Alexandria (100-5342, 100-5343, and 100-5344): Table 4-1 of the report identifies these three buildings as "Not eligible". The DHR agrees that they are not individually eligible for listing in the NRHP; however, it is unclear to us if the buildings are located within the East Rosemont Historic District. If so, they should be considered contributing to the historic district.

Hackley-Monroe House/James Monroe House/Joseph Jones House (DHR Inventory No. 111-0038/111-0132-0509): DHR agrees that this property contributes to the Fredericksburg Historic District; however, we are not prepared at this time to concur that it is individually eligible for listing in the NRHP. We have reservations regarding the large addition to the house. Please complete a Phase II Intensive Level Survey Form for this property and continue to consult with DHR on its potential to warrant individually listing.

Shiloh Baptist Church New Site (DHR Inventory No. 111-0132-0147): DHR agrees that this property contributes to the Fredericksburg Historic District; however, we are not prepared at this time to concur that it is individually eligible for listing in the NRHP. The history of the church and its congregation does not appear any more consequential or noteworthy than other African-American church of similar time period. Please complete a Phase II Intensive Level Survey Form for this property and continue to consult with DHR on its potential to warrant individually listing.

Loving's Produce Company (DHR Inventory No. 127-0344-0102): DHR agrees that this property contributes to the Shockoe Valley and Tobacco Row Historic District; however, we do not agree that it is individually eligible for listing to the NRHP. The building is architecturally indistinct and its history does not distinguish it from other properties of similar type and time period within the historic district.

Philip Morris Operations Complex (DHR Inventory No. 127-5818): Please complete a Phase II Intensive Level Survey Form for this property and continue to consult with DHR on its potential to warrant individually listing. The Phase II should provide a strong argument why the complex meets exceptional significance under Criterion Consideration G.

Hanover County School Board (DHR Inventory No. 166-5073-0024): DHR does not believe this property to be individually eligible for listing in the NHRP. It demonstrates a considerable loss of historic integrity, particularly with regard to the change in fenestration. We do believe; however, that the building contributes to the Berkleytown Historic District.

Finally, the following comments pertain to the architectural survey itself, the resulting report, and associated V-CRIS forms. Please address our questions and concerns as appropriate.

000-0022-0003: Table 4-1 gives the date of construction as 1792, while the corresponding V-CRIS for has the construction date as 1920. Which is correct?

020-5392: The V-CRIS form and photographs for this property was not included with the other survey materials.

020-5409: Table 4-1 gives the date of construction as ca. 1940, while the corresponding V-CRIS for has the construction date as ca.1910. Which is correct?

042-5791: Table 4-1 gives the date of construction as pre-1968, while the corresponding V-CRIS for has the construction date as ca.1960. Which is correct?

043-5467: Table 4-1 gives the date of construction as 1954-1960, while the corresponding V-CRIS for has the construction date as 1959. Which is correct?

043-6058: Table 4-1 gives the date of construction as 1939, while the corresponding V-CRIS for has the construction date as ca.1955. Which is correct?

076-5838: Table 4-1 gives the date of construction as pre-1968, while the corresponding V-CRIS for has the construction date as ca.1965. Which is correct?

100-0137-0274: Table 4-1 gives the date of construction as 1925, while the corresponding V-CRIS for has the construction date as ca.1920. Which is correct?

127-0816-0083: Table 4-1 gives the date of construction as ca.1957, while the corresponding V-CRIS for has the construction date as 1975. Which is correct?

127-5818: Table 4-1 references Criterion Consideration D; however, it should be Criterion Consideration G.

127-7157: Table 4-1 gives the date of construction as 1910-1970, while the corresponding V-CRIS for has the construction date as ca.1954. Which is correct?

166-5073-0018: Table 4-1 gives the date of construction as pre-1968, while the corresponding V-CRIS for has the construction date as ca.1960. Which is correct?

166-5073-0020: Table 4-1 gives the date of construction as pre-1966, while the corresponding V-CRIS for has the construction date as ca.1945. Which is correct?

166-5073-0021: Table 4-1 gives the date of construction as pre-1966, while the corresponding V-CRIS for has the construction date as ca.1960. Which is correct?

166-5073-0023: Table 4-1 gives the date of construction as pre-1968, while the corresponding V-CRIS for has the construction date as ca.1950. Which is correct?

166-5073-0025: Table 4-1 gives the date of construction as ca.1920, while the corresponding V-CRIS for has the construction date as pre-1968. Which is correct?

166-5092: Table 4-1 gives the date of construction as pre-1968, while the corresponding V-CRIS for has the construction date as ca.1930. Which is correct?

166-5100: Table 4-1 gives the date of construction as 1956, while the corresponding V-CRIS for has the construction date as ca.1940. Which is correct?

166-5115: Table 4-1 gives the date of construction as ca.1950, while the corresponding V-CRIS for has the construction date as 1940. Which is correct?

166-5121: Table 4-1 gives the date of construction as 1961, while the corresponding V-CRIS for has the construction date as ca.1950. Which is correct?

166-5122: Table 4-1 gives the date of construction as pre-1968, while the corresponding V-CRIS for has the construction date as ca.1950. Which is correct?

166-5123: Table 4-1 gives the date of construction as 1962, while the corresponding V-CRIS for has the construction date as ca.1950. Which is correct?

166-5124: Table 4-1 gives the date of construction as 1954, while the corresponding V-CRIS for has the construction date as ca.1950. Which is correct?

166-5125: Table 4-1 gives the date of construction as pre-1968, while the corresponding V-CRIS for has the construction date as ca.1960. Which is correct?

166-5126: Table 4-1 gives the date of construction as 1935, while the corresponding V-CRIS for has the construction date as ca.1960. Which is correct?

166-5127: Table 4-1 gives the date of construction as pre-1968, while the corresponding V-CRIS for has the construction date as ca.1960. Which is correct?

In addition to those properties already addressed above, there are three V-CRIS forms which DHR received for architectural resources that are not included in Table 4-1 of the report. These are for a house associated with the Laurel Industrial School Historic District (DHR Inventory No. 043-0292-0006), a cemetery along Dawson Beach Road (DHR Inventory No. 076-5839), and for a culvert associated with the RF&P Railroad (DHR Inventory No. 089-5623). The consultant's recommendation for these three properties as expressed in the respective V-CRIS forms is that they are not individually eligible for listing in the NRHP. The house (043-0292-000) is recommended as contributing to the Laurel Industrial School Historic District, while the culvert (089-5623) is said to be in ruinous condition and not contributing to the RF&P Railroad. The DHR agrees with these recommendations and asks that Table 4-1 be revised to include these three properties.

Please continue to consult with DHR on the outstanding NRHP eligibility issues for this undertaking pursuant to our comments expressed above.

If you have any questions about our comments, please contact me at (804) 482-6090.

Sincerely,

Marc Holma

RE: Resource Eligibility/ Intensive Architectural Studies (Report A)
Southeast High Speed Rail (DC2RVA) Project, Washington, D.C. to Richmond Segment
DHR #2014-0666

Dear Marc,

The Federal Railroad Administration (FRA) and the Virginia Department of Rail and Public Transportation (DRPT) are continuing environmental studies associated with the Tier II Environmental Impact Statement (EIS) for the Washington, D.C. to Richmond segment of the Southeast High Speed Rail (DC2RVA) corridor (Project). The limits of the Project extend from Control Point RO (MP CFP-110) in Arlington south to the CSX Transportation ("CSXT") A-Line/CSXT-S-Line junction at MP A-11 in Centralia, Virginia (Chesterfield County), a distance of approximately 123 miles.

This project is receiving federal funding through the FRA, requires permits issued by federal agencies such as the U.S. Army Corps of Engineers, and will traverse federal land including parcels owned by the U.S. Marine Corps and the National Park Service, among others. Due to the involvement of these and several other federal entities, the undertaking requires compliance with the National Environmental Policy Act (NEPA) and Section 106 of the National Historic Preservation Act (NHPA), as amended. The FRA sent your office a project Initiation letter on December 11, 2014, formally commencing the Section 106 process, and the project's area of potential effects (APE) was approved by the State Historic Preservation Officer (SHPO) on February 2, 2015, as required by 36 CFR 800.4(a)(1). Reconnaissance architectural studies on the main line and alternatives were coordinated with your office between 2015 and 2017. During these studies, along with subsequent documentation of additional areas outside of the original limits of disturbance, it was found that 54 resources required additional study to render a National Register of Historic Places (NRHP) evaluation as part of this project.

We are writing today to coordinate architectural evaluation studies on 13 of the 54 resources. This is the first of three reports that will be submitted to your office; as such, it is labeled as Report A to differentiate it from upcoming Reports B and C, which will contain studies on the remaining 33 resources. As such, enclosed please find two hard copies and one electronic copy of the report entitled

Architectural Intensive Investigations for the Washington, D.C. to Richmond Southeast High Speed Rail (DC2RVA) Project (Report A). The report was authored by Kerri S. Barile, Kristine A. Chase, Sean Maroney, Adriana T. Moss, Danae Peckler, and Heather Dollins Staton with Dovetail Cultural Resource Group (Dovetail), a member of the DC2RVA Project Team. The report meets all standards set forth in both the Secretary of Interior's Standards and Guidelines (1983) and the Virginia Department of Historic Resource's (DHR) *Guidelines for Preparing Identification and Evaluation Reports* (2011).

Of the 13 resources included in this report, it is recommended that 11 are eligible for the NRHP. The **Richmond, Fredericksburg, and Potomac (RF&P) Railroad Bridge over Occoquan River (500-0001-0022)**, located east of U.S. Route 1 Highway (Route 1) in Woodbridge, Virginia, is a 1915 Parker through-truss railroad bridge that crosses the Occoquan River. This railroad bridge is the only metal through-truss along the 123-mile RF&P Railroad line, and moreover, there are only three other Parker through-truss bridges in the Commonwealth of Virginia, all of which are vehicular. It is recommended eligible for individual listing in the NRHP under Criterion C as an example of a rare early truss design in the Commonwealth of Virginia. It is also recommended that the resource remains contributing to the RF&P Railroad Historic District (500-0001). It is recommended not eligible under Criteria A and B, and it was not evaluated under Criterion D.

The **Rappahannock River Railroad Bridge (111-0132-0025)** is a multi-span, open-spandrel, concrete-arch railroad structure. It was built circa 1927 to replace an earlier bridge located in roughly the same area when the rail system was raised in the city to allow for vehicular traffic below the tracks. The bridge is one of merely a handful of reinforced poured-concrete, open-spandrel bridges in the state and is the only example on record at the DHR within the surrounding counties. It has excellent integrity. It is recommended eligible for individual listing in the NRHP under Criterion C. It is also recommended to be a contributing element to both the RF&P Railroad Historic District (500-0001) and the Fredericksburg Historic District (111-0132). It is recommended not eligible under Criteria A and B, and it was not evaluated under Criterion D.

The **Dixon House at 401–403 Sophia Street (111-0023)** was a two-story, four-bay dwelling built with no discernable style. The building was demolished in August 2015, shortly after being recorded as part of the DC2RVA project. As it is no longer extant, it is recommended not eligible for listing in the NRHP under Criteria A–C; it also is recommended not eligible under Criterion D due to limited archaeological potential. It is recommended non-contributing to the eligibility of the Fredericksburg Historic District (111-0132).

Built in 1910, the **Fredericksburg Train Station (111-0132-0704)** is a rectilinear, two-story, five-bay, brick building constructed in the Georgian Revival style. The Fredericksburg Train Station is the most prominent surviving symbol of the importance of rail travel to the community, and visitors from across the nation stepped through the station's doors. It is also an excellent example of Georgian Revival architecture with high levels of integrity. As such, it is recommended that the property is eligible for the NRHP as an individual resource under Criteria A and C. It is also suggested to be a contributing element to the Fredericksburg Historic District (111-0132). It is recommended not eligible under Criterion B, and it was not evaluated under Criterion D.

The industrial building complex at 401–403 Charles Street, known locally as the **Purina Tower Complex (111-0132-0020)**, includes a large, one-and-a-half-story, warehouse main block and a six-story, concrete, grain elevator appended to its northwest corner. It is one of downtown Fredericksburg's most familiar and important landmarks and has helped define the community's skyline for nearly a century. It is also one of the few, and possibly only, surviving reinforced-concrete buildings in Fredericksburg constructed using the slip-form method. It is suggested that this resource is individually eligible for the NRHP under Criteria A and C, and is also a contributing element to the Fredericksburg Historic District (111-0132). It is recommended not eligible under Criterion B, and it was not evaluated under Criterion D.

The **George Aler House at 314–316 Frederick Street (111-5296/111-0132-0522)** is a two-story, four-bay, duplex constructed in 1851. The building and its yard were used as a slave jail in the 1850s, thus this property has a notable connection to significant local and state events. It is the only known extant slave jail in Fredericksburg. The interior has undergone modifications in the twentieth century, altering its historic character. It is recommended that this property is eligible for the NRHP under Criteria A and B for its association with the slave trade in Fredericksburg, most notably George Aler—Fredericksburg's most prolific seller of enslaved individuals. It is also suggested that the property is a contributing element to the Fredericksburg Historic District (111-0132). It is recommended not eligible under Criteria B and C, and it was not evaluated under Criterion D.

The primary resource at **Pulliam's Service Station (111-0009-0795)** is a one-story, one-bay (structural), former filling station constructed circa 1937 in the Spanish Mission Revival style. Two additional garages are located on the parcel. Not only is the resource an excellent example of the "house style" service station popular in the early-twentieth century, it reflects the important impact that the automobile had on Fredericksburg's economy and built environment during the early decades of the twentieth century. It is recommended that this resource is eligible for the NHRP under Criteria A and C, as well as a contributing element to the Fredericksburg Historic District Extension (111-0009). It is recommended not eligible under Criterion B, and it was not evaluated under Criterion D.

The **Fredericksburg Historic District Extension (111-0009)** encompasses an approximately 40-block area bordering the north, west, and south margins of Fredericksburg's original 50-block downtown Fredericksburg Historic District (111-0132). The district embodies and helps to narrate the city's growth and evolution from late-eighteenth century, riverside port town to a modern city. The architectural stock in the district ranges from modest, small-scale, vernacular, worker housing to large, high-style dwellings, interspersed with commercial, educational, ecclesiastic, and industrial places. It is recommended that this resource is eligible for the NRHP under Criteria A and C. It is suggested to be not eligible under Criterion B, and it was not evaluated under Criterion D.

The **Slaughter Pen Farm property (088-0254)** currently consists of a circa-1898 main dwelling, circa-1894 tenant house, two agricultural buildings, two domestic outbuildings, and a ditch fence. The property was the site of a fierce engagement during the Battle of Fredericksburg in December 1862, one of the most intense engagements of the Battle of Fredericksburg and the Civil War as a whole. It is recommended eligible for listing in the NRHP under Criterion A for its significance and association with the December 1862 Battle of Fredericksburg. In 2014, DHR staff determined that the resource contributes to the eligibility of the Fredericksburg and Spotsylvania County Battlefields National Military Park Historic District (111-0147). The DC2RVA Team recommends that it continue to contribute to the historic district. It is recommended not eligible under Criteria B and C, and it was not evaluated under Criterion D.

The **City of Richmond Department of Public Works Maintenance Yard (127-6840)** at 2728 Hermitage Road was recorded in 2016 as part of the DC2RVA Project identification-level survey. At that time, access to the resource was not obtained and the DC2RVA Team recommended that additional studies would need to be completed in order to gather sufficient data to make an NRHP eligibility evaluation. In a letter dated November 30, 2016, DHR concurred with this recommendation. In early 2017, this City of Richmond Department of Public Works Maintenance Yard was demolished. Since the resource is no longer extant, it is recommended to be not eligible for the NRHP as an individual resource under Criteria A–C; it was not evaluated under Criterion D.

The **Chesapeake and Ohio Railroad Segment (C&O Railroad Segment) (127-6793)**, the currently documented segment of a much larger railroad system, runs from the Shockoe Valley area of downtown Richmond near North 20th Street, westward along the northern bank of the James River and ending at Powhite Parkway (Route 76). It is recommended that the C&O Railroad Segment is eligible for listing in the NRHP under Criterion A for its association with transportation at the regional level. It is suggested to be not eligible under Criteria B and C, and it was not evaluated under Criterion D.

The **Southern Railway Segment (127-6792)**, a short segment of a much larger railroad system, runs along the south end of the Shockoe Bottom area of Richmond, Virginia, adjacent to the James River and then crosses the river, traveling southwest along the railroad tracks west of the Mayo Bridge (127-5808; 127-5809). The railway then follows the southern embankment along the river to the Powhite Parkway (Route 76). The railroad had played such a significant role in transportation development in both the area around Richmond and in the state as a whole; as such, it is recommended eligible for the NRHP under Criterion A. It is recommended not eligible under Criteria B and C, and it was not evaluated under Criterion D.

Located between Washington, DC and Richmond, the **RF&P Railroad Historic District (500-0001)** is made up of the RF&P Railroad and a wide variety of associated secondary resources, such as bridges and culverts. From 1837 to 1943, the railroad played a critical role in the development and evolution of the region and was a prominent local railroad within the Mid-Atlantic. It is recommended that this resource is eligible for the NRHP under Criterion A. It is suggested to be not eligible under Criteria B and C, and it was not evaluated under Criterion D.

We invite your agency to concur with these recommendations within 30 days of receipt of this letter. If you have questions about historic property studies for this project, please do not hesitate to contact me or Adriana Moss at (540) 899-9170 or via email at kbarile@dovetailcrg.com or amoss@dovetailcrg.com.

Sincerely,

Kerri S. Barile, Ph.D.
President, Dovetail Cultural Resource Group

CC: Emily Stock, DRPT
John Winkle, FRA
Michael Estes, HDR
Carey Burch, HDR
Stephen Walter, Parsons

The Virginia SHPO concurs that the following resources are eligible for the NRHP as individual resources:

111-0009	Fredericksburg Historic District Extension (Criteria A & C)
127-6792	Southern Railway Segment (Criterion A)
127-6793	C&O Railroad Segment (Criterion A)
500-0001	RF&P Railroad Historic District (Criterion A)

They further concur that the following resources are individually eligible for the NRHP and are contributing elements to the Fredericksburg Historic District (111-0132):

111-0132-0020	Purina Tower Complex (Criteria A & C)
111-0132-0704	Fredericksburg Train Station (Criteria A & C)
111-5296/111-0132-0522	George Aler House at 314–316 Frederick Street (Criteria A & B)

They concur that the following resource is individually eligible for the NRHP and is a contributing element to the Fredericksburg Historic District Expansion (111-0009):

111-0009-0795	Pulliam's Service Station (Criteria A & C)

They also concur that the following resources are individually eligible for the NRHP and are contributing elements to the RF&P Railroad Historic District (500-0001):

500-0001-0022	RF&P Railroad Bridge over Occoquan River (Criterion C)

They further concur that the following resource is individually eligible for the NRHP and is also a contributing element to both the Fredericksburg Historic District (111-0132) and the RF&P Railroad Historic District (500-0001):

111-0132-0025	Rappahannock River Railroad Bridge (Criterion C)

They concur that the following resource is individually eligible for the NRHP and is as contributing elements to the Fredericksburg and Spotsylvania County Battlefields National Military Park Historic District (111-0147):

088-0254	Slaughter Pen Farm property (Criterion A)

Lastly, they concur that the following resources are not eligible for the NRHP as individual resources under Criteria A–C and they do not contribute to the eligibility of a historic district:

111-0023	Dixon House at 401–403 Sophia Street
127-6840	City of Richmond Department of Public Works Maintenance Yard

SUMMARY AND RECOMMENDATIONS OF THE ARCHITECTURAL RESOURCES

DHR ID	Name/ Description	City/ County	Date / Time Period	Phase II Recommendation
500-0001-0022	RF&P Bridge over Occoquan River	Prince William County	1915	Eligible Under Criterion C; Contributing to the RF&P Railroad HD
111-0132-0025	Rappahannock River Railroad Bridge	City of Fredericksburg	1927	Eligible Under Criterion C; Contributing to the Fredericksburg HD and the RF&P Railroad HD
111-0023	Dixon House 401–403 Sophia Street	City of Fredericksburg	ca. 1834	No Longer Extant; Not Eligible
111-0132-0704	Fredericksburg Train Station 200 Lafayette Boulevard	City of Fredericksburg	ca. 1910	Eligible Under Criteria A & C; Contributing to the Fredericksburg HD
111-0132-0020	Purina Tower Complex401–403 Charles Street	City of Fredericksburg	ca. 1916	Eligible Under Criteria A & C; Contributing to the Fredericksburg HD
111-0132-0522	George Aler House 314–316 Frederick Street	City of Fredericksburg	1851	Eligible Under Criteria A & B; Contributing to the Fredericksburg HD
111-0009-0795	Pulliam's Service Station 411 Lafayette Boulevard	City of Fredericksburg	ca. 1937	Eligible Under Criteria A & C; Contributing to the Fredericksburg HD Extension
111-0009	Fredericksburg Historic District Extension	City of Fredericksburg	1794–1967	Eligible Under Criteria A & C
088-0254	Slaughter Pen Farm 11232 Tidewater Trail	Spotsylvania County	ca. 1861	Eligible Under Criterion A; Fredericksburg and Spotsylvania County Battlefields National Military Park HD
127-6840	The City of Richmond Department of Public Works Maintenance Yard 2728 Hermitage Road	City of Richmond	ca. 1955	No Longer Extant; Not Eligible
127-6792	Southern Railway Segment	City of Richmond	ca. 1850	Eligible Under Criterion A
127-6793	Chesapeake & Ohio Railroad Segment	City of Richmond	Pre-1851	Eligible under Criterion A
500-0001	Richmond, Fredericksburg & Potomac Railroad Historic District	Multiple	ca. 1837–1943	Eligible Under Criterion A

The Virginia SHPO concurs that the following resources are eligible for the NRHP as individual resources:

111-0009 Fredericksburg Historic District Extension (Criteria A & C)
127-6792 Southern Railway Segment (Criterion A)
127-6793 C&O Railroad Segment (Criterion A)
500-0001 RF&P Railroad Historic District (Criterion A)

They further concur that the following resources are individually eligible for the NRHP and are contributing elements to the Fredericksburg Historic District (111-0132):

111-0132-0020 Purina Tower Complex (Criteria A & C)
111-0132-0704 Fredericksburg Train Station (Criteria A & C)
111-5296/111-0132-0522 George Aler House at 314–316 Frederick Street (Criteria A & B)

They concur that the following resource is individually eligible for the NRHP and is a contributing element to the Fredericksburg Historic District Expansion (111-0009):

111-0009-0795 Pulliam's Service Station (Criteria A & C)

They also concur that the following resources are individually eligible for the NRHP and are contributing elements to the RF&P Railroad Historic District (500-0001):

500-0001-0022 RF&P Railroad Bridge over Occoquan River (Criterion C)

They further concur that the following resource is individually eligible for the NRHP and is also a contributing element to both the Fredericksburg Historic District (111-0132) and the RF&P Railroad Historic District (500-0001):

111-0132-0025 Rappahannock River Railroad Bridge (Criterion C)

They concur that the following resource is individually eligible for the NRHP and is as contributing elements to the Fredericksburg and Spotsylvania County Battlefields National Military Park Historic District (111-0147):

088-0254 Slaughter Pen Farm property (Criterion A)

Lastly, they concur that the following resources are not eligible for the NRHP as individual resources under Criteria A–C and they do not contribute to the eligibility of a historic district:

111-0023 Dixon House at 401–403 Sophia Street
127-6840 City of Richmond Department of Public Works Maintenance Yard

RE: Resource Eligibility/ Intensive Architectural Studies (Report B)
Southeast High Speed Rail (DC2RVA) Project, Washington, D.C. to Richmond Segment
DHR #2014-0666

Dear Marc,

The Federal Railroad Administration (FRA) and the Virginia Department of Rail and Public Transportation (DRPT) are continuing environmental studies associated with the Tier II Environmental Impact Statement (EIS) for the Washington, D.C. to Richmond segment of the Southeast High Speed Rail (DC2RVA) corridor (Project). The limits of the Project extend from Control Point RO (MP CFP-110) in Arlington south to the CSX Transportation ("CSXT") A-Line/CSXT-S-Line junction at MP A-11 in Centralia, Virginia (Chesterfield County), a distance of approximately 123 miles.

This project is receiving federal funding through the FRA, requires permits issued by federal agencies such as the U.S. Army Corps of Engineers, and will traverse federal land including parcels owned by the U.S. Marine Corps and the National Park Service, among others. Due to the involvement of these and several other federal entities, the undertaking requires compliance with the National Environmental Policy Act (NEPA) and Section 106 of the National Historic Preservation Act (NHPA), as amended. The FRA sent your office a project Initiation letter on December 11, 2014, formally commencing the Section 106 process, and the project's area of potential effects (APE) was approved by the State Historic Preservation Officer (SHPO) on February 2, 2015, as required by 36 CFR 800.4(a)(1). Reconnaissance architectural studies on the main line and alternatives were coordinated with your office between 2015 and 2017. During these studies, along with subsequent documentation of additional areas outside of the original limits of disturbance and a meeting with your office on April 4, 2018, it was found that 52 resources required additional study to render a National Register of Historic Places (NRHP) evaluation as part of this project.

We are writing today to coordinate architectural evaluation studies on 21 of the 52 resources. This is the second of three reports that will be submitted to your office; as such, it is labeled as Report B to differentiate it from previously submitted Report A and upcoming Report C, both of which contain studies on the remaining 31 resources. As such, enclosed please find two hard copies and one electronic copy of the report entitled *Architectural Intensive Investigations for the Washington, D.C. to Richmond Southeast High Speed Rail (DC2RVA) Project (Report B)*. The report was authored by Kerri S. Barile, Melissa Butler, Adriana T. Moss, Danae Peckler, Heather Dollins Staton, Caitlin Sylvester, and Lenora Wiggs with Dovetail Cultural Resource Group (Dovetail), a member of the DC2RVA Project Team. The report meets all standards set forth in both the Secretary of Interior's Standards and Guidelines (1983) and the Virginia Department of Historic Resource's (DHR) *Guidelines for Preparing Identification and Evaluation Reports* (2011).

Of the 21 resources included in this report, it is recommended that 15 are eligible for the NRHP. The resources are presented here in north to south order.

The **Phoenix Mill (100-0277)**, now an office building, at 3640 Wheeler Avenue in Alexandria is a Colonial-era vernacular flour mill constructed sometime after 1777. Though it has undergone a number of interior and exterior changes over time, the core of the original building remains intact and in generally good condition. The resource is recommended as locally significant under Criterion A as representative of the significance of mills in eighteenth- and nineteenth-century manufacturing. The resource is not known to be associated with a significant person from history and because of this, it is recommended not eligible under Criterion B. The Phoenix Mill is a unique example of an extant eighteenth-century, brick grist mill in the City of Alexandria. As such, it is also recommended as locally significant under Criterion C for architecture. As an architectural resource, it was not evaluated under Criterion D.

The **Hannah P. Clark House, also known as the Enyedi House (029-5741)** and located in Fairfax County, is associated with long-time area residents, Hannah P. Clark and the Potter family, and with an internationally renowned artist, Janos Enyedi, who lived and worked at the house until his death in 2011. The primary resource, the dwelling itself, is believed to be a rare surviving example of log construction; however, the building is enclosed in modern materials with additions and is known to have been moved. It is recommended that this resource is eligible at the local level under Criterion B for its association with Janos Enyedi and under Criteria Consideration B for a moved property and Criteria Consideration G for significance of less than 50 years. It is recommended not eligible under Criteria A and C, and it was not evaluated under Criterion D.

The **Jackson Shrine (016-0092)** in Caroline County is a historic commemorative complex centered on a one-and-a-half-story, frame building constructed circa 1828 that once served as the farm office for Fairfield Plantation and is the only nineteenth-century building still standing on the site. In 1936, the National Park Service (NPS) acquired the building and established the Jackson Shrine. Based on the current study as well as an analysis by the NPS in 2014 (which had not yet been formally coordinated with your office), the Jackson Shrine is recommended eligible for listing in the NRHP under Criterion A for its association with early NPS commemoration efforts and Criterion C for its architectural merit. The resource is also recommended as contributing to the Fredericksburg and Spotsylvania County Battlefields National Military Park Historic District (111-0147).

Built around 1900, the **Woodford Freight and Passenger Depot (016-0222)** in Caroline County serviced both freight and passenger traffic for the village. Today, the building is one of only two surviving RF&P Railroad depots in Caroline County. Despite being moved from its original location, the resource maintains proximity to, and a visual connection with, the railroad tracks. It is recommended that this resource is eligible for the NRHP under Criterion C for its architectural merit and as a rare example of a surviving rail depot in this area, as well as Criterion Consideration B as a moved property. It is recommended not eligible under Criteria A and B, and it was not evaluated under Criterion D.

The **First Woodford Post Office (016-0223)** in Caroline County is a small one-story, one-bay frame building believed to date circa 1875 and served as the community post office until 1936 when a new building was constructed. It has no known association with any significant event or person and therefore is recommended not eligible for the NRHP under Criteria A or B. The building is believed to be one of few surviving rural post offices in Caroline County and the sole surviving non-residential resource from the late-nineteenth century constructed in the Queen Anne style in Woodford. As such, it is recommended eligible for the NRHP under Criterion C at the local level and Criteria Consideration B as a moved resource. It was not evaluated under Criterion D.

The **Glenwood House (016-0224)** in Caroline County was constructed around 1928. It is an outstanding example of an American Foursquare with modest Craftsman and Colonial Revival-style elements. Such stylized dwellings are not common in this part of Caroline County; as such, it is recommended eligible under Criterion C at the local level. It has no notable association with an important event or individual, thus it is recommended not eligible under Criteria A and B. As an architectural resource, it was not evaluated under Criterion D.

The **Excelsior Industry of Caroline County Historic District (016-5165)** includes a noncontiguous group of properties along the RF&P Railroad constructed between 1896 and 1960 associated with the manufacture of excelsior—Caroline County's largest industry in the early-twentieth century. Due to the district's notable connection with the history and development of the county, physically, economically, and socially, it is recommended eligible under Criterion A at the local level. The district has no known associations with a significant individual, thus it is suggested that the district is not eligible for the NRHP under Criterion B. Due to the rare nature of the built resources and their prominence on the landscape, the district is recommended eligible under Criterion C. It was not evaluated under Criterion D.

The **Milford Historic District (016-5136)** in Caroline County represents a small rural community established in the eighteenth century as a tobacco trading center that continued to prosper in the nineteenth and early-twentieth centuries due to the construction of the railroad. The Milford Historic District is recommended as eligible for the NRHP under Criterion A for its association with industry and transportation at the local level. The district has no known association with a notable person, thus it is recommended not eligible under Criterion B. Taken as a whole, the Milford Historic District is a distinctive example of a railroad community in Caroline County; and therefore, recommended eligible for the NRHP under Criterion C at the local level. As an architectural resource, the Milford Historic District was not evaluated under Criterion D.

The **Coghill-Jeter Store (016-0286)** in Caroline County is the only surviving commercial building in the largely abandoned village of Penola and is representative of the small country stores once found in crossroads communities and railroad stops throughout rural Caroline County. There is no known association with this resource and a notable event (Criterion A) or important individual (Criterion B). Although there are other surviving examples of general stores in railroad-focused communities within the county, though, not many retain their historic fabric as does the Coghill-Jeter Store. It is recommended that this resource is eligible for the NRHP under Criterion C. It was not evaluated under Criterion D.

Founded around 1850, the **Doswell Historic District (042-5448**) comprises a notable collection of nineteenth and twentieth century resources that were constructed in association with increased rail traffic. The district is recommended as eligible for the NRHP under Criterion A for its connection to notable transportation planning and development at the local level. It retains a high level of overall historic integrity and continues to reflect the architectural trends of the period in which they were constructed, unlike many other rural railroad communities in Central Virginia. It is recommended eligible for the NRHP under Criterion C at the local level for its representation of a turn-of-the-century, railroad community. It is recommended not eligible under Criterion B, and it was not evaluated under Criterion D.

The **Tri-County Bank -Doswell Branch (042-0469)** is a two-story, three-bay, masonry building constructed circa 1920 in a vernacular commercial building style with limited Colonial Revival elements. The financial institution, although important to the Doswell community for the early- to mid-twentieth century, has not been used as a bank for approximately 50 years. For these reasons, it is recommended that the resource is not eligible for listing in the NRHP under Criterion A. It is also recommended not eligible under Criterion B. The Tri-County Bank is a strong example of an early-twentieth century masonry commercial building concentrated in a formerly prosperous railroad community warranting recommendation for eligibility under Criterion C for architecture at the local level. As an architectural resource, it was not evaluated under Criterion D. It is also recommended to be a contributing element to the Doswell Historic District (042-5448).

The **Doswell Depot and Tower (historically known as the C&O/RF&P Station and HN Tower; 042-5466)** is currently used as the offices of the Buckingham Branch of CSXT. Constructed after a circa-1907 station burned at this location in 1927, the current depot remains in use for rail-related activities. It is recommended eligible for the NRHP under Criterion A for its significant associations with transportation and development in Doswell at the local level and Criterion C for its architectural merit as an excellent example of a medium-sized rail station with associated tower. It is recommended not eligible under Criterion B, and it was not evaluated under Criterion D. The resource is also recommended to be a contributing element to the Doswell Historic District (042-5668).

The **Robert Stiles Building or Main Building of the Laurel Industrial School (043-0292-0001)** in Henrico County is a Romanesque Revival-styled educational building commissioned by the Prison Association of Virginia and completed around 1894. Being one of the only surviving examples of this important period of prison reform, the resource is recommended as eligible under Criterion A at the state level. As it is an exemplary example of the Romanesque Revival architectural style, it is recommended eligible for the NRHP under Criterion C at the local level. It is recommended not eligible under Criterion B, and it was not evaluated under Criterion D. It is also suggested to remain a contributing element to the Laurel Industrial School Historic District (043-0292).

Once located in Manchester, the **Winfree Cottage (127-6129)**, now in the City of Richmond, is a one-story dwelling constructed around 1866. It was first the house owned by Emily Winfree, a former enslaved person, and her children. Although it is no longer in its original location, the Winfree Cottage is one of the few known surviving physical representations of this time period and aspect of African American history and life around Richmond following the Civil War. For these reasons, it is recommended eligible under Criterion A. Although moved, the house still has many of its original architectural components and is therefore recommended eligible under Criterion C as well as Criterion Consideration B. It is recommended not eligible under Criterion B, and it was not evaluated under Criterion D as it is an architectural resource with no subsurface matrix.

The **Railroad Young Men's Christian Association (YMCA) (127-0344-0123)** in Richmond is a three-story, three-bay, rectangular, Italian Renaissance Revival-style commercial building constructed in 1907 by the Philadelphia architectural firm of Wilson, Harris and Richards jointly funded by the Seaboard Air Line and Chesapeake and Ohio railroads. It is recommended eligible for the NRHP under Criterion A for its strong association with railroad transportation in Richmond as well as the larger national YMCA movement. The resource is not known to be associated with one significant person from history and because of this, it is recommended not eligible under Criterion B. Due to its exceptional architectural merit, it is recommended as locally significant under Criterion C. As an architectural resource, it was not evaluated under Criterion D. The resource is also suggested to remain a contributing element to the Shockoe Valley and Tobacco Row Historic District (127-0344).

The remaining six resources are recommended to be not individually eligible for the NRHP: **Milford State Bank (016-0270), Woodford Historic District (016-5129), Doswell Inn (042-0468), Darnell's Store/Squashapenny Junction (042-0470), RF&P Paint Shop (043-5636),** and the **Philip Morris Tobacco Storage Warehouse (127-0197)**. The enclosed report contains data on each of these resources.

We invite your agency to concur with these recommendations within 30 days of receipt of this letter. If you have questions about historic property studies for this project, please do not hesitate to contact me or Adriana Moss at (540) 899-9170 or via email at kbarile@dovetailcrg.com or amoss@dovetailcrg.com.

Sincerely,

Kerri S. Barile, Ph.D.
President, Dovetail Cultural Resource Group

CC: Emily Stock, DRPT
John Winkle, FRA
Michael Estes, HDR
Carey Burch, HDR
Stephen Walter, Parsons

The Virginia SHPO concurs that the following resources are eligible for the NRHP as individual resources:

016-0222	Woodford Passenger Depot (Criterion C, Criterion Consideration B)
016-0223	First Woodford Post Office (Criterion C, Criterion Consideration B)
016-0224	Glenwood House (Criterion C)
016-0286	Coghill-Jeter Store (Criterion C)
016-5136	Milford Historic District (Criteria A & C)
016-5165	Excelsior Industry of Caroline County Historic District (Criteria A 7 C)
029-5741	Hannah P. Clark House/Enyedi House (Criterion B, Criteria Considerations B & G)
042-5448	Doswell Historic District (Criteria A & C)
100-0277	Phoenix Mill (Criteria A & C)
127-6129	Winfree Cottage (Criteria A & C)

They further concur that the following resource is individually eligible for the NRHP and is a contributing element to the Fredericksburg & Spotsylvania National Military Park (111-0147):

016-0092	Jackson Shrine (Criteria A & C)

They concur that the following resources are individually eligible for the NRHP and are contributing elements to the Doswell Historic District (042-5448):

042-5466	Doswell Depot and Tower (Criteria A & C)
042-0469	Tri-County Bank- Doswell Branch (Criterion C)

They also concur that the following resource is individually eligible for the NRHP and is a contributing element to the Laurel Industrial School Historic District (043-0292):

043-0292-0001	Robert Stiles Building/Main Building (Criteria A & C)

They further concur that the following resource is individually eligible for the NRHP and is also a contributing element to the Shockoe Valley and Tobacco Row Historic District (127-0344):

127-0344-0123	Railroad YMCA (Criteria A & C)

They concur that the following resource is not individually eligible but is a contributing element to the Milford Historic District (016-5136):

016-0270	Milford State Bank

They also concur that the following resources are not individually eligible but contribute to the Doswell Historic District (042-5338):

042-0468	Doswell Inn
042-0470	Darnell's Store/Squashapenny Junction

They further concur that the following resource is not individually eligible but contributes to the Shockoe Valley and Tobacco Row Historic District (127-0344):

127-0197	Philip Morris Tobacco Storage Warehouse

Lastly, they concur that the following resources are not eligible for the NRHP as individual resources under Criteria A–C and they do not contribute to the eligibility of a historic district:

016-5129	Woodford Historic District
043-5636	RF&P Paint Shop

SUMMARY AND RECOMMENDATIONS OF THE ARCHITECTURAL RESOURCES
(Listed north to south as they appear in the associated report)

DHR ID	Name/ Description	City/ County	Date / Time Period	Phase II Recommendation
100-0277	Phoenix Mill, 3642 Wheeler Avenue	City of Alexandria	ca. 1776	Eligible under Criteria A & C
029-5741	Hannah P. Clark House/ Enyedi House, 10605 Furnace Road	Fairfax County	ca. 1839; 1986–2011	Eligible under Criterion B & Criteria Consideration B & G
016-0092	The Jackson Shrine, 12019 Stonewall Jackson Road	Caroline County	1828	Eligible Under Criteria A & C; Contributing to the Fredericksburg and Spotsylvania County Battlefields National Military Park HD
016-5129	Woodford Historic District	Caroline County	1874–1969	Not Eligible
016-0223	First Woodford Post Office, Lake Farm Road	Caroline County	1874–1875	Eligible under Criterion C and Criteria Consideration B
016-0222	Woodford Freight & Passenger Depot, Woodford Road	Caroline County	ca. 1900	Eligible under Criterion C and Criteria Consideration B
016-0224	Glenwood House, 11102 Woodford Road	Caroline County	1928–1929	Eligible Under Criteria C
016-5165	Excelsior Industry of Caroline County Historic District	Caroline County	ca. 1925– ca. 1960	Eligible Under Criteria A & C
016-5136	Milford Historic District	Caroline County	ca. 1880–1960	Eligible under Criteria A & C
016-0270	Milford State Bank, 15461 Antioch Road	Caroline County	ca. 1910	Not Eligible; Contributing to Milford HD
016-0286	Coghill-Jeter Store, 22275 Penola Road	Caroline County	ca. 1880	Eligible under Criterion C
042-5448	Doswell Historic District	Hanover County	1880–1940	Eligible under Criteria A & C
042-0469	Tri-County Bank-Doswell Branch, 10561 Doswell Road	Hanover County	1920-1961	Eligible under Criterion C; Contributing to the Doswell HD
042-0470	Darnell Store, 10570 Doswell Road	Hanover County	ca. 1898	Not Eligible; Contributing to Doswell HD
042-0468	Doswell Inn, 10567 Doswell Road	Hanover County	ca. 1890	Not Eligible; Contributing to the Doswell HD
042-5466	Doswell Depot and Tower, 10577 Doswell Road	Hanover County	ca. 1928	Eligible under Criterion C, Contributing to Doswell HD

DHR ID	Name/ Description	City/ County	Date / Time Period	Phase II Recommendation
043-0292-0001	Robert Stiles Building/ Main Building of the Laurel Industrial School, 2900 Hungary Road	Henrico County	1895	Eligible under Criteria A & C; Contributing to the Laurel Industrial School HD
043-5636	RF&P Paint Shop, 2260 Dabney Road	Henrico County	1940	Not Eligible
127-6129	Winfree Cottage, East Franklin Street	City of Richmond	ca. 1866	Eligible Under Criteria A & C
127-0344-0123	Railroad Youth Men's Christian Association (YMCA), 1552 East Main Street	City of Richmond	1907	Eligible under Criteria A & C
127-0197	Philip Morris Leaf Storage Warehouse, 1717-1721 East Cary Street	City of Richmond	1914	Not Eligible; Contributing to the Shockoe Valley and Tobacco Row HD

RE: Phase II Intensive Level Architectural Surveys for SEHSR DC2RVA (Report B)
VDHR File No. 2014-0666

Dear Dr. Barile:

The Department of Historic Resources (DHR) has received for our review and comment the report "Architectural Intensive Investigations for the Washington, D.C. to Richmond Southeast High Rail (DC2RVA) Project, Report B" (April 2018) prepared by the DC2RVA Project Team and the twenty-one associated Phase II (Intensive Level) Virginia Cultural Resources Inventory System (V-CRIS) forms for the properties addressed in the report document. Of the twenty-one architectural resources recorded at the Phase II level for Report B, the consultant recommends fifteen are individually eligible for listing in the National Register of Historic Places (NRHP). Please see DHR's comments below.

Phoenix Mill (100-0277): The DHR concurs that this property is individually eligible for listing in the NRHP under Criterion A and Criterion C.

Hannah P. Clark/Janos Enyedi House (029-5741): The consultant recommends this property eligible for listing in the NRHP under Criterion B as the primary residence and studio of artist Janos Enyedi from 1986 until his death in 2011. Although described in the V-CRIS form as an "internationally known artist", DHR believes that it is too soon after his death to evaluate the significance of Enyedi's work as an artist to justify the threshold of "exceptional importance" required under Criterion Consideration G. Therefore, we do not agree that the Hannah P. Clark/Janos Enyedi House warrants individual listing in the NRHP.

Jackson Shrine (016-0092): The DHR concurs that this property is individually eligible for listing in the NRHP under Criterion A and Criterion C.

Woodford Freight and Passenger Depot (016-0222): The DHR concurs that this property is individually eligible for listing in the NRHP under Criterion C; however, we also believe that it is eligible under Criterion A for transportation and contributes to the RF&P Railroad (076-0301).

Fax: (540) 868-7033

First Woodford Post Office (016-0223): The DHR concurs that this property is individually eligible for listing in the NRHP under Criterion C; however, we also believe that it is eligible under Criterion A for the history of the Woodford community, a late-19th century railroad town.

Glenwood House (016-0224): The DHR disagrees with the consultant that this property is eligible under Criterion C. It is a relatively late example of a ubiquitous architectural style.

Excelsior Industry of Caroline County Historic District (016-5165): The DHR concurs that this property is individually eligible for listing in the NRHP under Criterion A and Criterion C.

Milford Historic District (016-5136): The DHR concurs that this property is individually eligible for listing in the NRHP under Criterion A and Criterion C.

Coghill-Jeter Store (016-0286): The DHR concurs that this property is individually eligible for listing in the NRHP Criterion C; however, we also believe that it is eligible under Criterion A for commerce.

Doswell Historic District (042-5448): The DHR concurs that this property is individually eligible for listing in the NRHP under Criterion A and Criterion C.

Tri-County Bank-Doswell Branch (042-0469): The consultant recommends this property eligible for listing in the NRHP under Criterion C as "a strong example of an early-twentieth century masonry commercial building constructed in a formerly prosperous railroad community". The DHR disagrees with this recommendation as we believe that the architectural design of the Tri-County Bank building is such that it does not distinguish it from other similar buildings in the historic district. We contend that this building is more appropriately identified as a contributing resource to the Doswell Historic District (042-5448) rather than individually eligible for listing in the NRHP on its own merits.

Doswell Depot and Tower (042-0093; also 042-5448 and 042-5466): The DHR concurs that this property is individually eligible for listing in the NRHP under Criterion A and Criterion C. The resource also contributes to the RF&P Railroad (076-0301) and Doswell Historic District (042-5448).

Winfree Cottage (127-6129): The consultant recommends this property eligible for listing in the NRHP under Criterion A as "one of the few known surviving physical representations of this time period and aspect of African American history and life around Richmond following the Civil War" and Criterion C as it contains much of its original historic fabric from its 1866 construction. The house currently sits on a temporary platform in a parking lot where in Richmond it was moved from its original location along 8th Street in Manchester, an independent city at the time of the home's construction. Criterion Consideration B for moved buildings states that "a property removed from its original or historically significant location can be eligible if it is significant primarily for architectural value or it is the surviving property most importantly associated with a historic person or event." The DHR believes that the Winfree Cottage, although removed from its historic setting, still is able to convey its architectural significance as a modest dwelling constructed by a freed slave immediately after the Civil War. We, therefore, support its NRHP eligibility under Criterion C. However, because the Winfree Cottage has been moved from its original setting and location in Manchester we do not believe that it is eligible under Criterion A.

Railroad Young Men's Christian Association (127-0344-0123): The DHR concurs that this property is individually eligible for listing in the NRHP under Criterion A and Criterion C. We also agree that the building remains eligible as a contributing resource to the Shockoe Valley and Tobacco Row Historic District (127-0344).

The DHR concurs that the follow properties are not individually eligible for listing to the NRHP; however, it is possible that they contribute to NRHP-eligible historic districts: Woodford Historic District (016-5129), Doswell Inn (042-0468), Darnell's Store/Squashapenny Junction (042-0470), RF&P Paint Shop (043-5636), and Philip Morris Tobacco Storage Warehouse (127-0197).

Finally, DHR was unable to conclude our review of Milford State Bank (016-0270) because the V-CRIS form was missing interior photographs and floorplan as is required by our Phase II survey guidelines. Please provide these materials at your earliest convenience.

If you have any questions about our comments, please contact me at (804) 482-6090.

Sincerely,

Marc Holma, Architectural Historian
Review and Compliance Division

Kerri,

I'm sorry, but you are correct, I did inadvertently leave out the Robert Stiles Building/Main Building of the Laurel Industrial School (DHR Inventory Number 043-0292-0001) in my 1 May 2018 letter. Please accept this email as DHR's official response that we concur with your recommendation that the property is individually eligible for listing in the NRHP under Criterion A for its association with late-19th century prison reform movement, and Criterion C for its architectural merit as a fine example of institutional Romanesque Revival style.

Sincerely,
Marc

RE: Resource Eligibility/ Intensive Architectural Studies (Report C)
Southeast High Speed Rail (DC2RVA) Project, Washington, D.C. to Richmond Segment
DHR #2014-0666

Dear Marc,

The Federal Railroad Administration (FRA) and the Virginia Department of Rail and Public Transportation (DRPT) are continuing environmental studies associated with the Tier II Environmental Impact Statement (EIS) for the Washington, D.C. to Richmond segment of the Southeast High Speed Rail (DC2RVA) corridor (Project). The limits of the Project extend from Control Point RO (MP CFP-110) in Arlington south to the CSX Transportation ("CSXT") A-Line/CSXT-S-Line junction at MP A-11 in Centralia, Virginia (Chesterfield County), a distance of approximately 123 miles.

This project is receiving federal funding through the FRA, requires permits issued by federal agencies such as the U.S. Army Corps of Engineers, and will traverse federal land including parcels owned by the U.S. Marine Corps and the National Park Service, among others. Due to the involvement of these and several other federal entities, the undertaking requires compliance with the National Environmental Policy Act (NEPA) and Section 106 of the National Historic Preservation Act (NHPA), as amended. The FRA sent your office a project Initiation letter on December 11, 2014, formally commencing the Section 106 process, and the project's area of potential effects (APE) was approved by the State Historic Preservation Officer (SHPO) on February 2, 2015, as required by 36 CFR 800.4(a)(1). Reconnaissance architectural studies on the main line and alternatives were coordinated with your office between 2015 and 2017. During these studies, along with subsequent documentation of additional areas outside of the original limits of disturbance and a meeting with your office on April 4, 2018, it was found that 52 resources required additional study to render a National Register of Historic Places (NRHP) evaluation as part of this project.

We are writing today to coordinate architectural evaluation studies on 18 of the 52 resources. This is the third of three reports that have been submitted to your office; as such, it is labeled as Report C to differentiate it from previously submitted Report A and Report B, both of which contain studies on the other 34 resources. As such, enclosed please find two hard copies and one electronic copy of the report entitled *Architectural Intensive Investigations for the Washington, D.C. to Richmond Southeast High Speed Rail (DC2RVA) Project (Report C)*. The report was authored by Kerri S. Barile, Melissa Butler, Adriana T. Moss, Heather Dollins Staton, Caitlin Sylvester, and Lenora Wiggs with Dovetail Cultural Resource Group (Dovetail), a member of the DC2RVA Project Team. The report meets all standards set forth in both the Secretary of Interior's Standards and Guidelines (1983) and the Virginia Department of Historic Resource's (DHR) *Guidelines for Preparing Identification and Evaluation Reports* (2011).

Of the 18 resources included in this report, it is recommended that 11 are eligible for the NRHP. These resources are presented here in north to south order.

The **Chancellor House (111-0013/ 111-0132-0508)** at 300 Caroline Street in Fredericksburg is a circa-1812, Federal-style dwelling that was later used by local slave traders, Smith and Finnall, from 1827 until 1833, as a holding pen for enslaved people before they would be sold throughout the Southeast. It is recommended eligible for individual listing in the NRHP under Criterion A for its associations with Fredericksburg's African-American population and regional slave trade during the mid-1800s. It is recommended not eligible under Criteria B and C as it has no known association with a notable individual and Federal-style dwellings are common in this section of Fredericksburg, and it was not evaluated under Criterion D. It is also recommended as a contributing element to the Fredericksburg Historic District (111-0132).

The **Dr. Charles Mortimer House (111-0067/ 111-0132-0509)** at 213 Caroline Street in Fredericksburg was built circa 1764 in the Georgian style as part of a developer-driven boom in housing on lower Caroline Street in the early development of Fredericksburg. This resource is recommended eligible under Criterion B at the local level for its association with Dr. Charles Mortimer, an important figure in Fredericksburg's history. The Dr. Charles Mortimer House is one of a handful of high-style Georgian buildings in Fredericksburg and it is the only example with its original outbuildings, thus it is recommended eligible under Criterion C. It is recommended not eligible under Criterion A, and it was not evaluated under Criterion D. It is also recommended as a contributing element to the Fredericksburg Historic District (111-0132).

Shiloh Baptist Church (New Site) (111-0132-0505) in Fredericksburg was constructed in 1890 and traces its roots back to the first Baptist church in Fredericksburg. The church has been an important part of the ante- and post-bellum, African-American community by being a space for spiritual and personal growth as well as playing a role in early African-American education and the Civil Rights Movement in Fredericksburg. It is recommended to be eligible for the NRHP under Criteria A and C as well as Criteria

Consideration A. It is also suggested to be a contributing element to the Fredericksburg Historic District (111-0132).

Located at 528 Caroline Street in Fredericksburg, the **Robert Adams Residence (111-0132-0458)** was built in 1891 as a high-style Italianate dwelling. No other high-style, Italianate dwellings are located within the boundaries of the Fredericksburg Historic District, rendering this dwelling a unique architectural example of this style in the downtown core. It is recommended eligible under Criterion C; it is recommended not eligible under Criteria A and B. As an architectural resource, it was not evaluated under Criterion D. This resource is also recommended to be a contributing element to the Fredericksburg Historic District (111-0132).

The **Berkleytown Historic District (166-5073**) is representative example of small-town, twentieth-century, African-American neighborhood. Berkleytown was believed to have been designed by black residents for black residents. As such, this “community within a community” reflects important patterns of community planning and development as well as ethnic heritage in Hanover County. It is recommended to be eligible for the NRHP under Criterion A; it is recommended not eligible under Criteria B and C as it has no known association with a notable individual and the architectural fabric within the district has lost historic integrity over the years. It was not evaluated under Criterion D.

The **Dabney Funeral Home (166-5073-0010)** in Berkleytown is a residence and commercial building constructed in the Minimal Traditional style and is one of the few remaining African-American-owned businesses in the Berkleytown neighborhood and Ashland as a whole. This resource continues to operate as a funeral home, a use it has performed since it was built in 1955. It is recommended that the resource is eligible for listing in the NRHP under Criterion A for its association with African-American-led trends in commerce in the Town of Ashland. It is suggested to be not eligible under Criteria B and C, and it was not evaluated under Criterion D. It is also recommended to be a contributing element to the Berkleytown Historic District (166-5073).

Built in 1886, the **Charles Gwathmey House (042-0113)** is a high-style, Queen Anne dwelling in the small rural community of Gwathmey, south of Ashland. The DC2RVA team recommends this resource as eligible under Criterion C as a unique example of a rural, high-style, Queen Anne dwelling in Hanover County. It is recommended not eligible under Criterion A as it has no known association with a notable event or under Criterion B as Judge Gwathmey is not believed to rise to the significance level required under this category. It was not evaluated under Criterion D.

The resource at 11701 Greenwood Road, recently known as **Hunton Treasures (043-0694)**, is a two-story, three-bay, commercial building constructed as a fueling station and convenience store sometime between 1930 and 1937. The building has undergone minimal changes over time and is an outstanding example of a service station and commercial building constructed in the early-twentieth century with

Spanish Revival elements and is the only Spanish Revival-style commercial building recorded in Henrico County. It is recommended eligible for the NRHP under Criterion C. It is recommended not eligible under Criteria A and B, and it was not evaluated under Criterion D.

The **Gilpin Court Apartment Complex (127-6883)** consists of 21 buildings, including 18 apartment buildings, a community center, a central heating plant, and a concession building. The complex was constructed in the early 1940s by the Richmond Redevelopment and Housing Authority (RRHA) and is the first public housing complex constructed in Richmond. It is recommended as eligible for listing in the NRHP under Criterion A for its association with Richmond's social history, ethnic heritage, and development as well as Criterion C as the first example of a federally funded public housing complex in the city. It is suggested to be not eligible under Criterion B, and it was not evaluated under Criterion D.

The commercial building known as **Loving's Produce Co. (127-0344-0102)** is a three-story building constructed around 1870 with Italianate-style elements. This is one of the sole representatives of one of the most notable periods of development in Richmond's history—postbellum rebuilding in a war-ravaged city; and therefore, it is recommended to be eligible under Criterion A. It has no known association with a notable individual and the building has undergone physical changes over time, thus it is suggested to be not eligible under Criteria B and C. It is also recommended to remain a contributing element of the Shockoe Valley and Tobacco Row Historic District (127-0344).

The **Philip Morris Operations Complex (127-5818)** located at 3601 Commerce Road is a mid-twentieth-century, light-industrial complex that serves as headquarters for the company's tobacco production; the main building was constructed between 1959 and 1973. The resource is recommended to be eligible for listing in the NRHP under Criterion A for its impacts of commerce and manufacturing in the tobacco industry and under Criterion C as a good example of an industrial-related building constructed in the post-modern Neoexpressionist and Brutalist styles. Because contributing portions of the complex are less than 50 years in age, it is also suggested to meet Criteria Consideration G.

The remaining seven resources are recommended to be not individually eligible for the NRHP: East Rosemont Historic District (100-5431), Jones-Monroe-Rennolds House (111-0038/ 111-0132-0509), Dry Bridge (042-0557), Hanover County School Board (166-5073-0024), Sinton House (042-0420), Elmont Historic District (042-5048), and Mill Road Historic District (043-0693). The enclosed Report Ccontains data on each of these resources.

We invite your agency to concur with these recommendations within 30 days of receipt of this letter. If you have questions about historic property studies for this project, please do not hesitate to contact me or Adriana Moss at (540) 899-9170 or via email at kbarile@dovetailcrg.com or amoss@dovetailcrg.com.

Sincerely,

Kerri S. Barile, Ph.D.
President, Dovetail Cultural Resource Group

CC: Emily Stock, DRPT
John Winkle, FRA
Michael Estes, HDR
Carey Burch, HDR
Stephen Walter, Parsons

The Virginia SHPO concurs that the following resources are eligible for the NRHP as individual resources:

042-0113	Charles Gwathmey House (Criterion C)
043-0694	Hunton Treasurers (Criterion C)
127-6883	Gilpin Court Apartment Complex (Criteria A and C)
127-5818	Philip Morris Operations Complex (Criteria A and C; Criteria Consideration G)
166-5073	Berkleytown Historic District (Criterion A)

They further concur that the following resources are individually eligible for the NRHP and are contributing elements to the Fredericksburg Historic District (111-0132):

111-0013/ 111-0132-0508	Chancellor House (Criterion A)
111-0067/ 111-0132-0505	Dr. Charles Mortimer House (Criteria B and C)
111-0132-0147	Shiloh Baptist Church (New Site) (Criteria A and C; Criteria Consideration A)
111-0132-0458	Robert Adams Residence (Criterion C)

They also concur that the following resource is individually eligible and contributes to the Shockoe Valley and Tobacco Row Historic District (127-0344):

111-0344-0102	Loving’s Produce Co. (Criterion A)

They concur that the following resource is individually eligible for the NRHP and is a contributing element to the Berkleytown Historic District (166-5073):

166-5073-0010	Dabney Funeral Home (Criterion A)

They also concur that the following resource is not individually eligible but contributes to the Fredericksburg Historic District (111-0132):

111-0038/ 111-0132-0509	Jones-Monroe-Rennolds House

They further concur that the following resource is not individually eligible but contributes to the Berkleytown Historic District (166-5073):

166-5073-0024	Hanover County School Board

Lastly, they concur that the following resources are not eligible for the NRHP as individual resources and they do not contribute to the eligibility of a historic district:

042-0420	Sinton House
042-5048	Elmont Historic District
042-0557	Dry Bridge
043-0694	Mill Road Historic District
100-5341	East Rosemont Historic District

RE: Phase II architectural survey for 18 properties (Report C) associated with the SEHSR DC2RVA
VDHR File No. 2014-0666

Dear Dr. Barile:

The Department of Historic Resources (DHR) has received for our review and comment the report "Architectural Intensive Investigations for the Washington, D.C. to Richmond Southeast High Rail (DC2RVA) Project, Report C" (May 2018) prepared by the DC2RVA Project Team and the associated Phase II (Intensive Level) Virginia Cultural Resources Inventory System (V-CRIS) forms for the properties addressed in the report document. The current Phase II architectural survey follows an earlier Phase I (Reconnaissance Level) survey addendum for the slightly expanded limits of disturbance (LOD) to accommodate further improvements and modifications to proposed rail infrastructure and associated road crossings. The expanded LOD areas were not included in the original architectural survey of the SEHSR DC2RVA corridor studies previously coordinated with DHR.

The DHR reviewed and commented on the addendum Phase I architectural survey in a letter dated 11 June 2018. At the time of that correspondence we had not reviewed the results of the Phase II architectural survey, which provides more detailed information on some of the properties included in the Phase I architectural survey. As a result, some of DHR's earlier comments and recommendations concerning National Register of Historic Places (NRHP) eligibility expressed in our 11 June letter or earlier communications may no longer be valid due to the additional data received through the Intensive Level survey process. Therefore, contradictions regarding eligibility to the NRHP or other issues between DHR's 11 June 2018 letter on the Phase I architectural survey or earlier correspondences on the undertaking and the current missive dated 12 June 2018 on the Phase II architectural survey are expected. Any such contradictions found are to be resolved by those opinions and determinations expressed by DHR in the current 12 June 2018 epistle on the Phase II architectural survey.

The consultant surveyed a total of 18 architectural properties at the Phase II Intensive Level. Of these properties it is recommended that 11 are individually eligible for listing in the NRHP. Please accept the follow as DHR's comments for those architectural resources documented.

Charles Gwathmey House (DHR Inventory No. 042-0113/042-0117-0003): DHR concurs that this property is eligible for listing in the NRHP under Criterion C. Table 4-1 in the report gives the date/time period as 1896-1920; however, the V-CRIS lists the date of construction as ca.1886. Which is correct?

Stinton House (DHR Inventory No. 042-0420/042-0117-0008): DHR concurs that this property is not eligible for listing in the NRHP.

Dry Bridge (DHR Inventory No. 042-0557): DHR concurs that this property is not eligible for listing in the NRHP.

Elmont Historic District (DHR Inventory No. 042-5048): DHR concurs that this property is not eligible for listing in the NRHP. Any properties located within the district determined earlier to be NRHP-eligible as contributing to the Elmont Historic District should no longer be considered as such. Table 4-1 in the report gives the date/time period as ca.1880-present day; however, the V-CRIS lists the date of construction as ca.1890. Which is correct?

Mill Road Historic District (DHR Inventory No. 043-0693): DHR concurs that this property is not eligible for listing in the NRHP.

Hunton Treasures (DHR Inventory No. 043-0694): DHR concurs that this property is eligible for listing in the NRHP under Criterion C.

East Rosemont Historic District (DHR Inventory No. 100-5341): DHR concurs that this property is not eligible for listing in the NRHP. Any properties located within the district determined earlier to be NRHP-eligible as contributing to the East Rosemont Historic District should no longer be considered as such.

Shiloh Baptist Church New Site (DHR Inventory No. 111-0132-0147): DHR concurs that this property is eligible for listing in the NRHP under Criteria A and C, and meets Criterion Consideration A. Table 4-1 in the report gives the date/time period as ca.1890-1968; however, the V-CRIS lists the date of construction as ca.1896. Which is correct?

Robert Adams Residence (DHR Inventory No. 111-0132-0458): DHR concurs that this property is eligible for listing in the NRHP under Criterion C.

Dr. Charles Mortimer House (DHR Inventory No. 111-0067/111-0132-0505): DHR concurs that this property is eligible for listing in the NRHP under Criteria B and C. Table 4-1 in the report gives the date/time period as ca.1764-1801; however, the V-CRIS lists the date of construction as ca.1780. Which is correct?

Chancellor House (DHR Inventory No. 111-0013/111-0132-0508): DHR does not concur that Chancellor House is individually eligible for listing in the NRHP. The consultant recommends the property eligible under Criterion A "for its association with the slave trade in Fredericksburg." However, the house seems only to have served in this function for a relatively short time in its history from 1827 to 1833. Shortly after Mr. William Smith purchased the Chancellor House for use as his primary dwelling he removed the iron bars from the windows and took down the 16-foot brick wall enclosing the "slave pen". Therefore, there are no longer any physical signs indicating the building's use in the slave trade. We do believe that the Chancellor House remains contributing to the Fredericksburg Historic District. Table 4-1 in the report gives the date/time period as 1812-1831; however, the V-CRIS lists the date of construction as ca.1780. Which is correct?

Hackley-Monroe House/James Monroe House/Joseph Jones House (DHR Inventory No. 111-0038/111-0132-0509): DHR concurs that this property is not individually eligible for listing in the NRHP. However, DHR agrees that this property contributes to the Fredericksburg Historic District.

Loving's Produce Company (DHR Inventory No. 127-0344-0102): DHR does not concur that Loving's Produce Company building is individually eligible for listing in the NRHP. The building is architecturally indistinct and its history does not distinguish it from other properties of similar type and time period within the historic district. DHR agrees that this property contributes to the Shockoe Valley and Tobacco Row Historic District.

Philip Morris Operations Complex (DHR Inventory No. 127-5818): DHR concurs that this property is eligible for listing in the NRHP under Criteria A and C, and meets Criterion Consideration G. Table 4-1 in the report gives the date/time period as 1959-1974; however, the V-CRIS lists the date of construction as ca.1950. Which is correct?

Gilpin Court Apartment Complex (DHR Inventory No. 127-6883): DHR concurs that this property is eligible for listing in the NRHP under Criteria A and C. This concurrence is only for the original buildings that date to 1942, not later phases of construction.

Berkleytown Historic District (DHR Inventory No. 166-5073): DHR concurs that this property is eligible for listing in the NRHP under Criterion A. Table 4-1 in the report gives the date/time period as ca.1900-1965; however, the V-CRIS lists the date of construction as ca.1910. Which is correct?

Dabney Funeral Home (DHR Inventory No. 166-5073-0010): DHR does not concur that Dabney Funeral Home building is individually eligible for listing in the NRHP. As an African-American owned business located in an historically African-American neighborhood it does not distinguish itself from any other commercial enterprise in Berkleytown. DHR agrees that this property contributes to the Berkleytown Historic District.

Hanover County School Board (DHR Inventory No. 166-5073-0024): DHR concurs that this property is not individually eligible for listing in the NRHP. It demonstrates a considerable loss of historic integrity, particularly with regard to the change in fenestration. DHR agrees that this property contributes to the Berkleytown Historic District.

If you have any questions about our comments, please contact me at (804) 482-6090.

Sincerely,

Marc Holma, Architectural Historian

Richmond, Virginia 23221

RE: Project Effect
Southeast High Speed Rail (DC2RVA) Project, Washington, D.C. to Richmond Segment
DHR #2014-0666

Dear Marc,

The Federal Railroad Administration (FRA) and the Virginia Department of Rail and Public Transportation (DRPT) are continuing environmental studies associated with the Tier II Environmental Impact Statement (EIS) for the Washington, D.C. to Richmond segment of the Southeast High Speed Rail (DC2RVA) corridor (Project). The limits of the Project extend from Control Point RO (MP CFP-110) in Arlington south to the CSX Transportation (“CSXT”) A-Line/CSXT-S-Line junction at MP A-11 in Centralia, Virginia (Chesterfield County), a distance of approximately 123 miles.

This project is receiving federal funding through the FRA, will traverse federal land including parcels owned by the U.S. Marine Corps and the National Park Service, and will require permits to be issued by federal agencies such as the U.S. Army Corps of Engineers. Due to the involvement of these and other federal entities, the undertaking requires compliance with the National Environmental Policy Act (NEPA) and Section 106 of the National Historic Preservation Act (NHPA), as amended. The FRA sent your office a project initiation letter on December 11, 2014, formally commencing the Section 106 process, and the project’s area of potential effects (APE) was approved by the State Historic Preservation Officer (SHPO; the Virginia Department of Historic Resources [DHR]) on February 2, 2015, as required by 36 CFR 800.4(a)(1).

HISTORIC PROPERTIES

Reconnaissance architectural studies and archaeological survey on the majority of the corridor and Project alternatives were coordinated with your office between 2015 and 2017. In the fall of 2017, a Draft Environmental Impact Statement (EIS) was produced and a Preferred Alternative was recommended by DRPT and the Commonwealth Transportation Board in December 2017. Subsequent technical studies were completed in spring 2018 to ensure that all areas within the APE were the subject of cultural resource studies; the results of this work were coordinated with your office through several meetings and reports. A full roster of all reports is included as Appendix A. Based on the project background reviews, technical studies, and previous coordination with your office, DRPT has determined that there are 118 historic properties in the APE (Appendix B). Of these, 58 are buildings, 32 are historic districts (including those that comprise structural elements such as railroads), 5 are structures, 12 are archaeological sites, 10 are battlefields, and 1 is a multicomponent resource that contains all resource types.

With regard to archaeological historic properties, most of the sites have been identified at the Phase I level but none have been the subject of Phase II-level evaluation testing as part of the current study. DRPT has elected to assume eligibility on all sites. DHR concurred with this approach during a meeting on July 26, 2017, and via email on July 31, 2017.

RESOURCE EFFECT RECOMMENDATIONS

In accordance with 36 CFR 800.5(a), DRPT has applied the criteria of adverse effect to these 118 properties. The regulations implementing Section 106 of the National Historic Preservation Act define an effect as an “alteration to the characteristics of a historic property qualifying it for inclusion in or eligible for the National Register” [36 CFR 800.16(i)]. The effect is adverse when the alteration of a qualifying characteristic occurs in a “manner that would diminish the integrity of the property’s location, design, setting, materials, workmanship, feeling, or association” [36 CFR 800.5(a)]. This letter presents effect recommendations for the 118 historic properties, followed by an overall project effect recommendation. The effect recommendations listed below were discussed with DHR at an in-person meeting on June 19, 2018, and this letter reflects all comments provided by your agency at that time. Maps of resources have been presented in the 20+ technical reports produced as part of this project; as such, maps showing resource locations are not repeated here.

Adverse Effect

Based on an evaluation of the project design, construction, and operations, DRPT recommends a finding of adverse effect on 14 above-ground resources and 9 archaeological sites. Resources where an adverse effect could occur are listed below from north to south.

Richmond, Fredericksburg, and Potomac Railroad (RF&P) (500-0001): The historic rail corridor includes the main rail line, spurs, and associated elements such as station houses, bridges, and other structures. The DC2RVA project will require the replacement of several contributing elements to this rail district (such as the bridge over Naomi Road [089-0080] and numerous culverts) and construction of new bridges adjacent to extant contributing resources (such as the Bridge over the Occoquan River [500-0001-0022, see more below]). The removal of these contributing elements to the linear district would diminish the characteristics that render this resource eligible for the NRHP.

RF&P Bridge over Occoquan River (500-0001-0022): This resource is a through-truss, camelback railroad bridge constructed in 1915. It is both individually eligible for the NRHP and a contributing element to the RF&P Railroad. Current plans include constructing a second bridge directly east of the existing span, thus introducing a new element adjacent to the current bridge. The project has the potential to diminish the property's integrity of design, setting, materials, feeling, and association through the introduction of this large new element.

Rippon Lodge (076-0023): One of the oldest houses in Prince William County, the vista from Rippon Lodge looking down Neabsco Creek (and current site of the railroad and associated bridge) was documented by Benjamin Latrobe in the late-eighteenth century. The waterway viewshed is a character-defining feature of this significant resource. A new railroad bridge across Neabsco Creek will be built as part of this project. The new bridge will be west of the existing span and will be a new primary element within the viewshed from Rippon Lodge, thus impacting a significant element of the property.

Civil War Campsite (44ST1223): The rail corridor was an extremely important component of transportation logistics associated with the Civil War, and war-related resources were often located near the tracks. This site represents one of many Union army winter encampments in the area, occupied during the winter of 1862–1863. The addition of a new set of tracks will require disturbances to the subsurface matrix within the site, thus potentially destroying data-bearing strata that contribute to the site's eligibility.

Rappahannock River Railroad Bridge and Associated Structures/Platform (111-0132-0025): This 1927 multiple-span, open-spandrel, concrete arch bridge was built across the Rappahannock River in 1927 when the rail tracks in Fredericksburg were elevated to allow for vehicular traffic below. The system also includes a series of rail structural supports and the passenger platform to the west, built at the same time. This structure is both individually eligible and a contributing element to both the RF&P Railroad (500-0001) and the Fredericksburg Historic District (111-0132). Proposed modifications include the construction of a new bridge immediately south of the existing span and changes to the structural supports and rail platform. These alterations will diminish the resource's integrity of design, setting, materials, workmanship, feeling, and association.

Marye's Mill Site (44SP1087): The site represents the remains of a large mill, located on the banks of the Rappahannock River, which was in operation during the second half of the nineteenth and first decades of the twentieth centuries. It is a prominent visual element in many Civil War-era representations of Fredericksburg. Construction associated with rail modifications and construction of a new bridge spanning the river will result in subsurface disturbances throughout the majority of the site, thus adversely affecting the data potential of this resource.

Fredericksburg Historic District (111-0132): This 200-acre district comprises the city's historic core and includes hundreds of residential, commercial, educational, ecclesiastic, and industrial buildings. Current project plans include the construction of a multi-story parking deck to the south of the extant rail tracks and construction of a new rail station to the north of the tracks. In addition, contributing elements to the district, such as the Rappahannock River Bridge and rail structural system listed above, will be modified during the work. The new structures will introduce new large-scale elements to the district, and other building and structural changes will diminish character-defining features of the district.

Block 49/Train Station (44SP0688) and Block 48/Train Station (44SP0687): These two archaeological sites comprise two city blocks in Fredericksburg, stretching from Sophia Street on the east to Princess Anne Street on the west and bounded by Lafayette Street on the north and Frederick Street on the south. Archaeological work has uncovered numerous foundations and other extant features below the ground surface. Construction of the new parking deck and new station, platform modifications, and other structural changes as proposed will result in subsurface disturbances throughout both blocks, which have the potential to damage intact archaeological remains.

Earthwork/Jackson's Earthwork (44SP0468): This archaeological site includes the remains of a large series of earthworks constructed during the First Battle of Fredericksburg (1862) and reused during other periods of the Civil War. They are located predominantly west of the rail tracks and have a notable connection to military actions during the war. The addition of a third rail in this area may result in the destruction of small segments of these earthworks.

Doswell Historic District (042-5448) and Doswell Depot and Tower (042-0093): The Doswell district encompasses a rural community that was once a center of major activity along the nearby road and rail networks. The Doswell Depot is located at the center of this district, and the associated tower can be found just south of the district on the east side of the tracks. While similar depots and towers were once located throughout this stretch of the RF&P corridor, most have been destroyed or notably altered. The Doswell Depot and Tower are in excellent condition. Construction associated with the undertaking will require moving the tower from its original site to a new location, likely to the east of the tracks (the Depot will not be altered). Moving the tower also has the potential to cause damage to the tower's structural system. These activities may diminish character-defining features of this resource and may diminish its integrity of location, design, setting, materials, workmanship, feeling, and association. In addition, proposed changes in this area, including the moving of the tower as well as other changes as the nearby contributing Squashapenny Store, will negatively affect character-defining features of the district.

Berkleytown Historic District (166-5073): This early-twentieth century development was created when segregated planning doctrines in nearby Ashland pushed African-American residents outside of the town's boundaries. Proposed plans include raising Archie Cannon Road, which comprises the northern boundary of the district, to pass over the railroad corridor. The construction of the new roadway structure will introduce a new visual element and also modify its original road plan, thus diminishing critical elements of the district.

Laurel Industrial School Historic District (043-0292) and Main Building/Robert Stiles Building of the Laurel Industrial School (043-0292-0001): The Laurel Industrial School, founded in 1892, was one of several reform campuses built in Virginia by the Prison Association of Virginia to rectify the state's broken penal system. The Robert Stiles Building served as the facility's main dormitory, chapel, school, and dining hall. Current project plans include grade-separating (i.e., raising) Hungary Road over the rail corridor. This action will result in the construction of a new road overpass structure within the viewshed of the district and Main Building and modifications of the road system within the district boundaries. These actions will impact the design, setting, feeling, and association of these two resources.

Shockoe Valley & Tobacco Row Historic District (127-0344), Main Street Station and Trainshed (127-0172), Seaboard Air Line Railroad (127-6271), and Railroad Y.M.C.A (127-0344-0123): These four resources are all located in Richmond's Shockoe Bottom. This area was the site of Richmond's earliest residential, commercial, and industrial activities, commencing in the eighteenth century. Due to its location near notable transportation hubs, it was also the location of numerous holding pens and markets specializing in the sale of enslaved individuals in the years prior to the Civil War. In 1900, the area was selected as the northern terminus of the Seaboard Air Line Railroad, a new rail route between Richmond and Florida, and Main Street Station and the Railroad Y.M.C.A. were built to cater to rail travelers. DRPT project plans include several changes to the existing rail infrastructure, including: elongating the passenger platforms at the station, creating new structural elements (piers) to support the platforms, and the construction of a new multi-story parking deck to the east of the station and immediately behind the Y.M.C.A. building. These changes will modify the existing viewshed from all four of these resources and alter character-defining features of the station—which is not only a National Historic Landmark but also a contributing element to the Shockoe Valley & Tobacco Row Historic District and the Seaboard Air Line Railroad.

Sites 44HE1098, 44HE1097, and 44HE1094: All three of these archaeological sites are located in downtown Richmond. They were recorded based on map projections showing the locations of post-Civil War warehouses that have been demolished; their exact composition and integrity is unknown as no archaeological studies have been conducted. Modifications to the structural support system for rail infrastructure in this area would result in minor subsurface disturbances within the recorded boundaries of these sites. Should these sites contain significant deposits, this work would negatively impact data-bearing strata.

Site 44HE0357: Like the sites above, this resource was recorded based on map projections. However, while the previous three sites represent warehouses, this site potentially includes a privy/pit complex associated with a former residential building. It is now the southern parking lot for Main Street Station. Structural system changes may require the installation of new piers in this area and thus impacts to potentially significant archaeological deposits may occur.

No Adverse Effect

DRPT recommends a finding of no adverse effect on 65 of the 118 historic properties within the Project's APE. DRPT's careful project analysis and redesigns have avoided impacts to these properties. While the Project may alter the viewshed or minor physical characteristics of these resources, it will not diminish any of the characteristics that render these resources eligible for the NRHP under Criteria A–D or Criteria Considerations A–G. These 64 resources include (listed north to south):

029-0218	Mount Vernon Memorial Highway (portion of George Washington Memorial Parkway)
000-0045	Washington National Airport (Reagan National Airport)
100-0133	Parker-Gray Historic District/Uptown
100-0137	Rosemont Historic District
100-0124	Alexandria Depot, 110 Callahan Drive
100-0277	Phoenix Mill, 3642 Wheeler Avenue
029-0043	Colchester Arms, Fairfax Arms, 10712 Old Colchester Road
111-0147	Fredericksburg & Spotsylvania Co. Battlefields National Military Park & Cemetery, Lee Drive
111-5295	Battle of Fredericksburg I
111-5296	Battle of Fredericksburg II
111-0132-0704	Fredericksburg Train Station, 200 Lafayette Boulevard
111-0132-0020	Purina Tower
111-0132-0522	House, 314–316 Frederick Street
111-0009-0795	Pulliam's Service Station, 411 Lafayette Boulevard
111-0009	Fredericksburg Historic District Extension
088-5181	Salem Church Battlefield (Banks Ford Battlefield)
088-5364	Virginia Central Railway Historic District
111-0145	Fredericksburg Gun Manufactory
088-0254	Slaughter Pen Farm, 11232 Tidewater Trail (Wayside Farm or Pierson Farm)
088-0039	La Vue, 3232 LaVue Lane (Prospect View)
016-0092	Fairfield Plantation Office, Jackson Shrine, 12019 Stonewall Jackson Road
016-5165	Excelsior Industry of Caroline County MPD

016-0223	First Woodford Post Office
016-0222	Woodford Freight & Passenger Depot, Woodford Road
016-5136	Milford Historic District
016-0270	Milford State Bank, 15461 Antioch Road
016-0286	Coghill-Jeter Store
042-0123	North Anna Battlefield
042-5307	Taylorsville Road Historic District
166-0001	Ashland Historic District
042-0113	Charles Gwathmey House, 11247 Gwathmey Church Road
043-5108	Yellow Tavern Battlefield
127-6136	Scott's Addition Historic District
127-6188	Movieland Bowtie Cinema, 1331 North Boulevard
127-5978	Todd Lofts, 1128 Hermitage Road
127-6145	Southern Stove Works, 1215 Hermitage Road
127-0414	Governor's School, 1000 North Lombardy Street
127-6883	Gilpin Court Apartment Complex, 203 Charity Street West/ 4 E. Hill Street/1403 St. James Street/ 1100 N 2nd Street
127-5679	Barton Heights Cemetery, 1600 Lamb Avenue
127-0353	Richmond Nursing Home, 210 Hospital Street
127-6166	Hebrew Cemetery, 320 Hospital Street
127-6129	Winfree Cottage, East Main Street
127-0219	Shockoe Slip Historic District and Expansions
127-6793	Chesapeake & Ohio (C&O) Railroad Segment
127-0171	James River and Kanawha Canal Historic District
127-5809	Bridge #1857, North 14th Street; Mayo Bridge North
127-6792	Southern Railway
127-0457	Manchester Warehouse Historic District
127-6193	J.P. Taylor Leaf Tobacco, Southern Stove Works, 516 Dinwiddie Ave
127-6245	Williams Bridge Company, Emergency Fleet Corporation Factory, 700 East 4th Street
127-6248	Pure Oil Company, 1314 Commerce Street, Transmontaigne
127-6213	Davee Gardens Historic District
127-5818	Philip Morris Operations Complex, 3601 Commerce Road
043-0307	Battle of Chaffin's Farm (New Market Heights Battlefield), New Market Road
020-0063	Falling Creek Ironworks Archaeological Site
020-5320	Proctor's Creek Battlefield
020-0147	Drewry's Bluff Battlefield (Fort Darling, Fort Drewry), Fort Darling Road

123-5025	Assault on Petersburg (Petersburg Battlefield II), Bermuda Hundred Road (Alt Route 697)
020-5336	The Bellwood-Richmond Quartermaster Depot Historic District, US Department of Defense Supply Center Historic District
020-0007	Bellwood, Sheffields, Auburn Chase, Building 42, Defense Supply Center Richmond, 8000 Jefferson Davis Hwy
44CF0680	Fort Darling/Battlefield, Earthworks, Fort/ Centralia Earthworks (020-0022)
020-5351	Richmond & Petersburg Electric Railway
127-6251	Atlantic Coast Line Railroad Corridor, Richmond and Petersburg Railroad
020-0140	Circle Oaks/4510 Centralia Road
020-0552	Centralia Post Office

No Effect

DRPT recommends the Project would have no effect on the remaining 30 historic properties. These resources are all located in the APE but their viewsheds are blocked from the project area by vegetation, extant buildings, or existing road/rail infrastructure. The project will not alter or diminish any character-defining features of these resources. These 30 resources include (listed north to south):

100-0160	George Washington Junior High School, 1005 Mt. Vernon Avenue
100-0128	George Washington National Masonic Memorial
029-0953	Old Colchester Road, Potomac Path, King's Highway
111-0067	Dr. Charles Mortimer House, House, 213 Caroline Street
111-0132-0458	Robert Adams Residence, 528 Caroline Street
111-0132-0147	Shiloh Baptist Church New Site, 521 Princess Anne Street
111-0132-0126	The 1770 House, 227 Princess Anne Street
016-0208	House, 12096 Guinea Drive
016-0220	Carolina Mansion, 11146 Woodford Road
042-0556	Hoopers, 11108 McConnell Lane
166-0001-0015	Business Office, Randolph-Macon College, 310 N. Center Street
166-5072	Randolph-Macon College Historic District Expansion
166-0002	Randolph-Macon College Historic District
166-0001-0008	Ashland Station Depot, 112 N. Railroad Avenue
166-5041	Priddy House, 107 Stebbins Street
166-0001-0055	Emily Gray House, 702 S. Center Street
166-0001-0060	Fleming Fox House, 708 S. Center Street
166-0036	MacMurdo House, 713 S. Center Street
166-0037	Hugo House/Lefebvre House, 904 S. Central Street
166-0001-0077	House, 1005 S. Center Street

043-0694	Hunton Treasures, 11701 Greenwood Road
043-0690	Lewis-McLeod House, 2945 Mountain Road
127-6730	Hermitage Road Warehouse Historic District
127-0354	Virginia Union University Historic District, 1500 North Lombardy Street
127-0822	Carver Residential Historic District
127-0428	George W. Carver Elementary School, 1110 West Leigh Streets
127-6171	Richmond and Chesapeake Bay Railway Barn, Richmond-Ashland Railway Company Car Barn
020-5474	DuPont Spruance
020-0013	House, 3619 Thurston Road
020-5378	VEPCo Power Transmission Line

PROJECT EFFECT RECOMMENDATION

In addition to evaluating the effect on individual historic properties, DRPT also assessed the overall project's potential to have an adverse effect on cultural resources. Based on the data presented above, DRPT has recommended a finding that the Project will have an adverse effect on 24 resources in the project APE. As such, DRPT recommends that the overall project will have an adverse effect on historic properties.

We invite your agency to concur with these recommendations within 30 days of receipt of this letter. If you have questions about these effect recommendations or cultural resource studies for this project in general, please do not hesitate to contact Ms. Emily Stock, DRPT Project Manager, at (804) 591-4433 or via email at Emily.stock@drpt.virginia.gov, or me at (540) 899-9170 or via email at kbarile@dovetailcrg.com.

Sincerely,

Kerri S. Barile, Ph.D.
President, Dovetail Cultural Resource Group

CC: Emily Stock, DRPT
John Winkle, FRA

Carey Burch, HDR
Stephen Walter, Parsons

The Virginia SHPO concurs that the Preferred Alternative for the DC2RVA project (DHR #2014-0666) will have an **adverse effect** on the following 23 resources (listed north to south):

500-0001	Richmond, Fredericksburg, and Potomac Railroad
500-0001-0022	RF&P Bridge over Occoquon River
076-0023	Rippon Lodge
44ST1223	Civil War Campsite
111-0132-0025	Rappahannock River Railroad Bridge and Associated Structures/Platform
44SP0187	Bridge/Marye's Mill
111-0132	Fredericksburg Historic District
44SP0688	Block 49/Train Station
44SP0687	Block 48/Train Station
44SP0468	Earthwork/ Jackson's Earthwork
042-5448	Doswell Historic District
042-0093	Doswell Depot and Tower, 10577 Doswell Rd
166-5073	Berkleytown Historic District
043-0292	Laurel Industrial School Historic District, Hungary Road
043-0292-0001	Main Building/Robert Stiles Building/Bluford Office Building, 2900 Hungary Road
127-0344	Shockoe Valley & Tobacco Row Historic District
44HE1098	Main Street Station Parking Lot/Railroad
44HE1097	Railroad, Warehouse
127-0172	Main Street Station and Trainshed, New Union Station, Seaboard Airline & Chesapeake & Ohio Railroad Depot
127-6271	Seaboard Air Line Railroad Corridor
44HE0357	Privy/Pit Complex
127-0344-0123	Railroad Y.M.C.A., 1552 East Main Street
44HE1094	Warehouse

They also concur that the projet will have **no adverse effect** on the following 65 resources (listed north to south):

029-0218	Mount Vernon Memorial Highway (portion of George Washington Memorial Parkway)
000-0045	Washington National Airport (Reagan National Airport)
100-0133	Parker-Gray Historic District/Uptown
100-0137	Rosemont Historic District
100-0124	Alexandria Depot, 110 Callahan Drive

100-0277	Phoenix Mill, 3642 Wheeler Avenue
029-0043	Colchester Arms, Fairfax Arms, 10712 Old Colchester Road
111-0147	Fredericksburg & Spotsylvania Co. Battlefields National Military Park & Cemetery, Lee Drive
111-5295	Battle of Fredericksburg I
111-5296	Battle of Fredericksburg II
111-0132-0704	Fredericksburg Train Station, 200 Lafayette Boulevard
111-0132-0020	Purina Tower
111-0132-0522	House, 314–316 Frederick Street
111-0009-0795	Pulliam's Service Station, 411 Lafayette Boulevard
111-0009	Fredericksburg Historic District Extension
088-5181	Salem Church Battlefield (Banks Ford Battlefield)
088-5364	Virginia Central Railway Historic District
111-0145	Fredericksburg Gun Manufactory
088-0254	Slaughter Pen Farm, 11232 Tidewater Trail (Wayside Farm or Pierson Farm)
088-0039	La Vue, 3232 LaVue Lane (Prospect View)
016-0092	Fairfield Plantation Office, Jackson Shrine, 12019 Stonewall Jackson Road
016-5165	Excelsior Industry of Caroline County MPD
016-0223	First Woodford Post Office
016-0222	Woodford Freight & Passenger Depot, Woodford Road
016-5136	Milford Historic District
016-0270	Milford State Bank, 15461 Antioch Road
016-0286	Coghill-Jeter Store
042-0123	North Anna Battlefield
042-5307	Taylorsville Road Historic District
166-0001	Ashland Historic District
042-0113	Charles Gwathmey House, 11247 Gwathmey Church Road

020-5351	Richmond & Petersburg Electric Railway
127-6251	Atlantic Coast Line Railroad Corridor, Richmond and Petersburg Railroad
020-0140	Circle Oaks/4510 Centralia Road
020-0552	Centralia Post Office

The further concur that the project will have **no effect** on the following 30 resources (listed north to south):

100-0160	George Washington Junior High School, 1005 Mt. Vernon Avenue
100-0128	George Washington National Masonic Memorial
029-0953	Old Colchester Road, Potomac Path, King's Highway
111-0067	Dr. Charles Mortimer House, House, 213 Caroline Street
111-0132-0458	Robert Adams Residence, 528 Caroline Street

111-0132-0147	Shiloh Baptist Church New Site, 521 Princess Anne Street
111-0132-0126	The 1770 House, 227 Princess Anne Street
016-0208	House, 12096 Guinea Drive
016-0220	Carolina Mansion, 11146 Woodford Road
042-0556	Hoopers, 11108 McConnell Lane
166-0001-0015	Business Office, Randolph-Macon College, 310 N. Center Street
166-5072	Randolph-Macon College Historic District Expansion
166-0002	Randolph-Macon College Historic District
166-0001-0008	Ashland Station Depot, 112 N. Railroad Avenue
166-5041	Priddy House, 107 Stebbins Street
166-0001-0055	Emily Gray House, 702 S. Center Street
166-0001-0060	Fleming Fox House, 708 S. Center Street
166-0036	MacMurdo House, 713 S. Center Street
166-0037	Hugo House/Lefebvre House, 904 S. Central Street
166-0001-0077	House, 1005 S. Center Street
043-0694	Hunton Treasures, 11701 Greenwood Road
043-0690	Lewis-McLeod House, 2945 Mountain Road
127-6730	Hermitage Road Warehouse Historic District
127-0354	Virginia Union University Historic District, 1500 North Lombardy Street
127-0822	Carver Residential Historic District
127-0428	George W. Carver Elementary School, 1110 West Leigh Streets
127-6171	Richmond and Chesapeake Bay Railway Barn, Richmond-Ashland Railway Company Car Barn
020-5474	DuPont Spruance
020-0013	House, 3619 Thurston Road
020-5378	VEPCo Power Transmission Line

Given these resommendations, the Virginia SHPO therefore agrees that the project will have an **overall adverse effect on historic properties**.

Appendix A:
List of Cultural Resource Reports Completed on the DC2RVA Project Area

Archaeological Sites/Resources (in publication order)

Klein, Mike, Emily Calhoun, Marco González, and Earl E. Proper
2015 *Archaeological Background Review and Predictive Model for the Washington, D.C. to Richmond, Virginia, Southeast High Speed Rail Corridor*. DC2RVA Project Team/Dovetail Cultural Resource Group, Fredericksburg, Virginia.

McCloskey, Kevin, Earl Proper, Curtis McCoy, Emily Calhoun, Morgan MacKenzie, and Joseph Blondino
2016 *Phase IB Archaeological Survey for the Washington, D.C. to Richmond, Virginia High Speed Rail Project Rosslyn to Alexandria (ROAF) through Buckingham Branch/Hospital Wye (BBHW) Segments*. DC2RVA Project Team/Dovetail Cultural Resource Group, Fredericksburg, Virginia.

McCloskey, Kevin, Emily Calhoun, Kerry González, and Mike Klein
2018 *Phase IB Archaeological Survey for the Washington, D.C. to Richmond, Virginia High Speed Rail Project Preferred Alternative Limits of Disturbance*. DC2RVA Project Team/Dovetail Cultural Resource Group, Fredericksburg, Virginia.

Buildings, Structures, Objects, and Districts (in publication order)

Staton, Heather Dollins, and Adriana Lesiuk
2015 *Architectural Reconnaissance Survey for the Washington, D.C. to Richmond, Virginia High Speed Rail Project Dahlgren Junction to Fredericksburg (DJFB) Segment, City of Fredericksburg and Stafford County*. DC2RVA Project Team/Dovetail Cultural Resource Group, Fredericksburg, Virginia.

Staton, Heather Dollins, Adriana Lesiuk, and M. Chris Manning
2016 *Architectural Reconnaissance Survey for the Washington, D.C. to Richmond, Virginia High Speed Rail Project Arkendale to Dahlgren Junction (ARDJ) Segment Stafford County*. DC2RVA Project Team/Dovetail Cultural Resource Group, Fredericksburg, Virginia.

Staton, Heather D., Adriana T. Lesiuk, and Emily K. Anderson
2016 *Architectural Reconnaissance Survey for the Washington, D.C. to Richmond, Virginia High Speed Rail Project Rosslyn to Alexandria (ROAF) Segment Arlington County and the City of Alexandria*. DC2RVA Project Team/Dovetail Cultural Resource Group, Fredericksburg, Virginia.

Staton, Heather Dollins, Adriana T. Lesiuk, Emily K. Anderson, and Earl P. Proper
2016 *Architectural Reconnaissance Survey for the Washington, D.C. to Richmond, Virginia High Speed Rail Project Alexandria to Franconia (AFFR) Segment City of Alexandria and Fairfax County*. DC2RVA Project Team/Dovetail Cultural Resource Group, Fredericksburg, Virginia.

Manning, M. Chris, Earl Proper, Adriana Lesiuk, and Heather Dollins Staton
2016 *Architectural Reconnaissance Survey for the Washington, D.C. to Richmond, Virginia High Speed Rail Project Franconia to Lorton (FRLO) Segment Fairfax County*. DC2RVA Project Team/Dovetail Cultural Resource Group, Fredericksburg, Virginia.

Staton, Heather Dollins, M. Chris Manning, and Adriana Lesiuk
2016 *Architectural Reconnaissance Survey for the Washington, D.C. to Richmond, Virginia High Speed Rail Project Lorton to Powells Creek (LOPC) Segment Prince William and Fairfax Counties*. DC2RVA Project Team/Dovetail Cultural Resource Group, Fredericksburg, Virginia.

Anderson, Emily K., and Heather D. Staton
2016 *Architectural Reconnaissance Survey for the Washington, D.C. to Richmond, Virginia High Speed Rail Project Fredericksburg to Hamilton (FBHA) and Hamilton to Crossroads (HAXR) Segments, Spotsylvania County*. DC2RVA Project Team/Dovetail Cultural Resource Group, Fredericksburg, Virginia.

Manning, M. Chris, and Michelle Salvato
2016 *Architectural Reconnaissance Survey for the Washington, D.C. to Richmond, Virginia High Speed Rail Project Crossroads to Guinea (XRGU), Guinea to Milford (GUMD), and Milford to North Doswell (MDND) Segments Spotsylvania, Caroline, and Hanover Counties*. DC2RVA Project Team/Dovetail Cultural Resource Group, Fredericksburg, Virginia.

Lesiuk, Adriana T., and M. Chris Manning
2016 *Architectural Reconnaissance Survey for the Washington, D.C. to Richmond, Virginia High Speed Rail Project Elmont to Greendale (ELGN) Segment, Hanover and Henrico Counties*. DC2RVA Project Team/Dovetail Cultural Resource Group, Fredericksburg, Virginia.

Sylvester, Caitlin C., and Heather D. Staton

2016 *Architectural Reconnaissance Survey for the Washington, D.C. to Richmond, Virginia High Speed Rail Project Greendale to SAY/WAY (GNSA), SAY/WAY to AM Jct (SAAM) and Buckingham Branch/Hospital Wye (BBHW) Segments, Henrico County and City of Richmond*. DC2RVA Project Team/Dovetail Cultural Resource Group, Fredericksburg, Virginia.

Anderson, Emily K., and Heather D. Staton

2016 *Architectural Reconnaissance Survey for the Washington, D.C. to Richmond, Virginia High Speed Rail Project AM Jct to Centralia - S Line (AMCE) and AM Jct to Fulton Yard (AMFY) Segments, City of Richmond and Chesterfield County*. DC2RVA Project Team/Dovetail Cultural Resource Group, Fredericksburg, Virginia.

Lesiuk, Adriana T., and Heather D. Station

2016 *Architectural Reconnaissance Survey for the Washington, D.C. to Richmond, Virginia High Speed Rail Project WAY to Centralia – A Line (WACE) Segment, Chesterfield County and City of Richmond*. DC2RVA Project Team/Dovetail Cultural Resource Group, Fredericksburg, Virginia.

Peckler, Danae

2016 *Architectural Reconnaissance Survey for the Washington, D.C. to Richmond, Virginia High Speed Rail Project North Doswell to Elmont (NDEL) Segment, Hanover County*. DC2RVA Project Team/Dovetail Cultural Resource Group, Fredericksburg, Virginia.

Chase, Kristine A.

2017 *Architectural Reconnaissance Survey of Structures for the Washington, D.C. to Richmond, Virginia High Speed Rail Project Rosslyn to Alexandria (ROAF) through Buckingham Branch/Hospital Wye (BBHW) Segments*. DC2RVA Project Team/Dovetail Cultural Resource Group, Fredericksburg, Virginia.

Moss, Adriana T., and Kerri S. Barile

2018 *Addendum: Architectural Reconnaissance Survey of the LOD Expansion Area for the Washington, D.C. to Richmond, High Speed Rail Project, Arlington, Caroline, Chesterfield, Hanover, Henrico, Fairfax, Prince William, Stafford, and Spotsylvania Counties and the Cities of Alexandria, Fredericksburg, and Richmond, Virginia*. DC2RVA Project Team/Dovetail Cultural Resource Group, Fredericksburg, Virginia.

Barile, Kerri S., Kristine A. Chase, Sean Maroney, Adriana T. Moss, Danae Peckler, and Heather Dollins Staton

2018 *Architectural Intensive Investigations for the Washington, D.C. to Richmond Southeast High Speed Rail (DC2RVA) Project (Report A).* DC2RVA Project Team/Dovetail Cultural Resource Group, Fredericksburg, Virginia.

Barile, Kerri S., Melissa Butler, Adriana T. Moss, Danae Peckler, Heather Dollins Staton, Caitlin Sylvester, and Lenora Wiggs

2018 *Architectural Intensive Investigations for the Washington, D.C. to Richmond Southeast High Speed Rail (DC2RVA) Project (Report B)*. DC2RVA Project Team/Dovetail Cultural Resource Group, Fredericksburg, Virginia.

Barile, Kerri S., Melissa Butler, Adriana T. Moss, Heather Dollins Staton, Caitlin Sylvester, and Lenora Wiggs

2018 *Architectural Intensive Investigations for the Washington, D.C. to Richmond Southeast High Speed Rail (DC2RVA) Project (Report C).* DC2RVA Project Team/Dovetail Cultural Resource Group, Fredericksburg, Virginia.

Combined Cultural Resources/Reconnaissance Studies (in publication order)

Staton, Heather Dollins, and Earl E. Proper

2016 *Archaeological and Architectural Phase IA Study for the Washington, D.C. to Richmond, Virginia High Speed Rail Project Ashland Bypass (ASBP) Segment, Hanover County*. DC2RVA Project Team/Dovetail Cultural Resource Group, Fredericksburg, Virginia.

Staton, Heather Dollins, D. Brad Hatch, and Emily Calhoun

2017 *Archaeological and Architectural Phase IA Study for the Washington, D.C. to Richmond, Virginia High Speed Rail Project Fredericksburg Bypass (FBBP) Segment, Stafford, Caroline, and Spotsylvania Counties*. DC2RVA Project Team/Dovetail Cultural Resource Group, Fredericksburg, Virginia.

N-S Order	DHR ID	Name/Description	City/County	Date / Time Period	Description	NRHP Eligibility	DHR Effect Determination	Image
1	500-0001	Richmond, Fredericksburg, and Potomac Railroad	Arlington County, City of Alexandria, Fairfax County, Prince William County, Stafford County, City of Fredericksburg, Spotsylvania County, Caroline County, Hanover County, Henrico County, City of Richmond	1836-1943	The RF&P opened in 1836 and eventually spanned from the Potomac River to Richmond. The corridor includes the main rail line, spurs, and associated elements such as station houses, bridges, and other structures.	Eligible under Criterion A	Adverse	
2	029-0218	Mount Vernon Memorial Highway (portion of George Washington Memorial Parkway)	Fairfax County, Arlington County	ca. 1929	The Mount Vernon Memorial Highway is an 8 ½-mile section of the George Washington Memorial Parkway from Fairfax County to the southern boundary of Alexandria. The four-lane wide highway was constructed with concrete slab construction and while much of the concrete remains intact.	Listed under Criteria A and C	No Adverse	
3	000-0045	Washington National Airport (Reagan National Airport)	Arlington County	1941	The primary/historic building is a four-story, multi-bay, airline passenger terminal constructed in the Moderne style. Property also includes six c 1941 airplane hangers and associated runways and other landscape elements.	Listed under Criteria A and C	No Adverse	
4	100-0160	George Washington Junior High School, 1005 Mt. Vernon Avenue	City of Alexandria	1935	The resource is a three-story, multi-bay school building constructed in the Art Deco style originally in a rectangular form. The building is constructed of large, cut, grey sandstone and brick laid in an irregular bond.	Potentially Eligible under C (Assuming eligible for undertaking)	No Effect	
5	100-0133	Parker-Gray Historic District/Uptown	City of Alexandria	ca. 1810	The district covers over 45 blocks in the northwestern quadrant of Old Town Alexandria and abuts the Alexandria Historic District. It consists mainly of small row houses and townhomes built in the mid-to-late nineteenth century.	Listed under Criteria A and C	No Adverse	
6	100-0137	Rosemont Historic District	City of Alexandria	ca. 1900	The district is a planned, residential subdivision that is located northwest of Old Town Alexandria. It consists mainly of small, middle-class houses built between 1908 and 1940.	Listed under Criteria A and C	No Adverse	
7	100-0124	Alexandria Depot, 110 Callahan Drive	City of Alexandria	1905	The train depot known as Alexandria Union Station at 110 Callahan Drive is a one-and-one-half-story, multi-bay, passenger depot constructed in the Colonial Revival style	Listed under Criteria A and C	No Adverse	
8	100-0128	George Washington National Masonic Memorial	City of Alexandria	ca. 1922	The resource at 101 Callahan Drive is a nine-story, multi-bay, memorial and museum sitting on a designed knoll constructed in the Classical Revival style.	Listed under Criterion C and Criteria Consideration F	No Effect	

N-S Order	DHR ID	Name/Description	City/County	Date / Time Period	Description	NRHP Eligibility	DHR Effect Determination	Image
9	100-0277	Phoenix Mill, 3642 Wheeler Avenue	City of Alexandria	ca. 1776	The building is a two-story, three-bay, industrial building. It is purportedly the "sole remaining example of a mill structure in Alexandria."	Eligible under Criteria A and C	No Adverse	
10	029-0953	Old Colchester Road, Potomac Path, King's Highway	Fairfax County	ca. 1664	This two-lane asphalt road runs northeast from the Occoquan River for approximately 4 miles to the intersection with Route 1 in Lorton. Old Colchester Road played an important role in the county's early transportation history.	Eligible under Criterion A	No Effect	
11	029-0043	Colchester Arms, Fairfax Arms, 10712 Old Colchester Road	Fairfax County	ca. 1756	The building ais a one-and-a-half story, four-bay tavern constructed with an irregular four-room plan. The timber-framed structural system rests on a continuous, raised-basement, stone foundation.	Listed under Criteria A and C	No Adverse	
12	500-0001-0022	RF&P Bridge over Occoquon River	Prince William County	1915	The resource is a through-truss, camelback railroad bridge constructed close to the middle of the height of this type of structure, 1870-1930. Although once common, few have survived.	Eligible under Criterion C; Contributing to RF&P HD	Adverse	500-0001-0022
13	076-0023	Rippon Lodge	Prince William County	1747	One of the oldest houses in Prince William County, the vista from Rippon Lodge looking down Neabsco Creek (and future site of the railroad) was documented by Benjamin Latrobe.	Listed under Criteria A and B	Adverse	
14	44ST1223	Civil War Campsite	Stafford County	1862-1863	This site represents a Civil War campsite occupied during the winter of 1862–1863 when the Union Army was ordered into winter quarters.	Potentially Eligible under Criterion D (Assuming eligible for undertaking)	Adverse	
15	111-0147	Fredericksburg & Spotsylvania Co. Battlefields National Military Park & Cemetery, Lee Drive	City of Fredericksburg	1862	The resource is a Civil War battlefield park composed of earthworks, cannons, and informational markers in addition to a total of 429 non-archaeological cultural resources, 350 of which are considered contributing to its significance.	Listed under Criteria A and D	No Adverse	
16	111-5295	Battle of Fredericksburg I	City of Fredericksburg	1862	The battlefield is the location of a Civil War battle that occurred between December 11 and December 15, 1862. Union Major General Ambrose Burnside and his troops battled General Robert E. Lee's Confederate men, resulting in a Confederate victory. The battlefield continues to retain a high level of integrity.	Eligible/Potentially Eligible under Criterion A	No Adverse	
17	111-5296	Battle of Fredericksburg II	City of Fredericksburg	1863	The Battlefield is a 12,694.2-acre battlefield associated with a Civil War battle of the same name, which took place on May 3, 1863. Despite expansive residential, commercial, and industrial development around the battlefield and the Fredericksburg, it continues to retain a high level of integrity	Eligible/Potentially Eligible under Criterion A	No Adverse	

N-S Order	DHR ID	Name/Description	City/County	Date / Time Period	Description	NRHP Eligibility	DHR Effect Determination	Image
18	111-0132-0025	Rappahannock River Railroad Bridge and Associated Structures/Platform	City of Fredericksburg	1927	This multiple-span, open-spandrel, concrete-arch bridge is an excellent and rare surviving example of a reinforced-concrete arch railroad bridge within this region of Virginia. It was erected when the station and tracks were elevated for automobile traffic pass through in downtown Fredericksburg.	Eligible under Criterion C; Contributing to Fredericksburg HD and RF&P HD	Adverse	111-0132-0025
19	44SP0187	Bridge/Marye's Mill	City of Fredericksburg	19th century	Terrestrial portion of the site occupies the location of Marye's Mill, depicted in an 1863 photograph taken during the Second Battle of Fredericksburg and mills identified on Gray's (1878) map of late-nineteenth-century Fredericksburg. Includes cut stone piers that are now located under the waters of the Rappahannock River, which may be associated with earlier railroad structures that are no longer extant.	Potentially Eligible under Criteria A and D (Assuming eligible for undertaking)	Adverse	
20	111-0132	Fredericksburg Historic District	City of Fredericksburg	post 1727	The district is a 200-acre area that comprises the city's downtown commercial area, adjacent industrial area, and some of the surrounding residential blocks. This part of Fredericksburg boasts a wide variety of infrastructure that ranges in date from the early eighteenth century throughout the late twentieth century	Listed under Criterion C	Adverse	
21	44SP0688	Block 49/Train Station	City of Fredericksburg	Late Archaic; 19th/20th c	Archaeological remains of several dwellings, outbuildings, and industrial features as identified by UMW in the early 1990s	Potentially Eligible under Criterion D (Assuming eligible for undertaking)	Adverse	
22	111-0067/ 111-0132-0505	Dr. Charles Mortimer House, House, 213 Caroline Street	City of Fredericksburg	1764-1801	The home is a two-story, five-bay, Federal-style single-family dwelling built circa 1764 in the Georgian style. Dr. Charles Mortimer was an important figure in Fredericksburg's history. The house is also one of a handful of high-style Georgian buildings in Fredericksburg and it is the only example with its original outbuildings.	Eligible under Criteria B and C; Contributing to Fredericksburg HD	No Effect	23	111-0132-0458	Robert Adams Residence, 528 Caroline Street	City of Fredericksburg	1891	The two story, two-bay resource was built in 1891 as a high-style Italianate dwelling. No other high-style, Italianate dwellings are located within the boundaries of the Fredericksburg Historic District.	Eligible under Criterion C; Contributing to Fredericksburg HD	No Effect	24	111-0132-0147	Shiloh Baptist Church New Site, 521 Princess Anne Street	City of Fredericksburg	1890-1968	This 2-story, multi-bay, Colonial Revival-style church was constructed in 1890 and has been an important part of the ante- and post-bellum, African-American community, playing a role in early African-American education and the Civil Rights Movement in Fredericksburg.	Eligible under Criteria A and C and Criteria Consideration A; Contributing to Fredericksburg HD	No Effect	25	44SP0687	Block 48/Train Station	City of Fredericksburg	Late Archaic; 19th/20th c	Archaeological remains of several dwellings, outbuildings, and industrial features as identified by UMW in the early 1990s	Potentially Eligible under Criterion D (Assuming eligible for undertaking)	Adverse	
26	111-0132-0704	Fredericksburg Train Station, 200 Lafayette Boulevard	City of Fredericksburg	1910	The depot is a two-story, five-bay building constructed in the Neoclassical style designed by notable local architect Peck Heflin. The adjacent rail tracks were raised in 1927.	Eligible under Criteria A and C; Contributing to Fredericksburg HD	No Adverse	
N-S Order	DHR ID	Name/Description	City/County	Date / Time Period	Description	NRHP Eligibility	DHR Effect Determination	Image
27	111-0132-0126	The 1770 House, 227 Princess Anne Street	City of Fredericksburg	1770	The home is a one-and-one-half-story dwelling constructed circa 1770 in the Tidewater tradition with some Georgian-style elements. It is a unique example of an eighteenth-century, working-class home in this part of town.	Potentially Eligible under Criterion C (Assuming eligible for undertaking); Contributing to Fredericksburg HD	No Effect	111-0132-0126
28	111-0132-0020	Purina Tower	City of Fredericksburg	1916	The resource is a one-and-one-half story commercial building with a tall grain elevator at the northwest corner. The tower has become an important landscape landmark within the community.	Eligible under Criteria A and C; Contributing to Fredericksburg HD	No Adverse	111-0132-0020
29	111-0132-0522	House, 314–316 Frederick Street	City of Fredericksburg	1851	This is a two-story, four-bay vernacular brick duplex. Oral history states that the building was used as a slave jail in the antebellum period.	Eligible under Criteria A and B; Contributing to Fredericksburg HD	No Adverse	111-0132-0522
30	111-0009-0795	Pulliam's Service Station, 411 Lafayette Boulevard	City of Fredericksburg	ca. 1937	This resource is a one-story filling station constructed in the Spanish Revival style. It still retains its original materials and configuration.	Eligible under Criteria A and C; Contributing to Fredericksburg HD	No Adverse	111-0009-0795
31	111-0009	Fredericksburg Historic District Extension	City of Fredericksburg	1794-1967	The district extension is a large area that includes a wide variety of resources immediately surrounding the city's downtown core including residences, commercial buildings, and churches dating to the 19th and 20th c.	Eligible under Criteria A and C	No Adverse	
32	088-5181	Salem Church Battlefield (Banks Ford Battlefield)	Spotsylvania County, City of Fredericksburg	1863	The battlefield includes the land where Hay's and Hoke's brigades attacked the Union Sixth Corps in 1863. It includes Confederate earthworks, Salem Church, and the path of the Plank Road.	Eligible under Criterion A	No Adverse	
33	088-5364	Virginia Central Railway Historic District	City of Fredericksburg, Spotsylvania County, and more	1853	The district is a 38-mile-long railroad corridor that extends west from the CSX railroad (formerly the RF&P) in Fredericksburg to the town of Orange encompassing rail-related structures, sites, and landscape features. The 3.5-mile long eastern section is eligible.	Eligible under Criterion A	No Adverse	
34	111-0145	Fredericksburg Gun Manufactory	City of Fredericksburg	ca. 1775	The Fredericksburg Gun Manufactory is an archaeological site that is at least 75 percent intact. The remains of the manufacturing facility are located beneath a paved asphalt parking lot for a public school.	Listed under Criteria A and D	No Adverse	
35	088-0254	Slaughter Pen Farm, 11232 Tidewater Trail (Wayside Farm or Pierson Farm)	Spotsylvania County	ca. 1861	Slaughter Pen Farm, also known as Wayside Farm or Pierson Farm, is a 19th century farm complex composed of a two-story, three-bay, Italianate-style, single-family dwelling, three agricultural outbuildings, a shed, one kitchen, a slave quarters, and a well.	Eligible under Criterion A	No Adverse	

N-S Order	DHR ID	Name/Description	City/County	Date / Time Period	Description	NRHP Eligibility	DHR Effect Determination	Image
36	44SP0468	Earthwork/ Jackson's Earthwork	Spotsylvania County	1861	This resource includes a set of earthworks within a larger archaeological site. The area is almost totally enclosed by lines of military shelter trenches constructed prior to or following the First Battle of Fredericksburg.	Potentially Eligible under Criteria A, C and D (Assuming eligible for undertaking)	Adverse	
37	088-0039	La Vue, 3232 LaVue Lane (Prospect View)	Spotsylvania County	ca. 1848	La Vue, also known as Prospect View, is a two-story, three-bay, single-family dwelling constructed in the Greek Revival style with an L-plan.	Listed under Criterion C	No Adverse	
38	016-0092	Fairfield Plantation Office, Jackson Shrine, 12019 Stonewall Jackson Road	Caroline County	1828	The resource is a one-and-a-half-story frame building; it once served as the office for the 740-acre Fairfield Plantation and is the only surviving building. On May 10, 1863, Confederate General Thomas Jonathan "Stonewall" Jackson died at the site after being wounded at the Battle of Chancellorsville.	Eligible under Criteria A and C	No Adverse	
39	016-0208	House, 12096 Guinea Drive	Caroline County	ca. 1900	The resource is a is a one-and-a-half-story vernacular dwelling with Queen Anne and Craftsman elements. The house was built from a kit purchased from the Sears & Roebuck Company.	Potentially Eligible under Criterion C (Assuming eligible for undertaking)	No Effect	
40	016-5165	Excelsior Industry of Caroline County MPD	Caroline County	ca. 1925-1960	This is a thematic collection of resources that are associated with the manufacture of excelsior, Caroline County's largest industry in the early twentieth century	Eligible under Criteria A and C	No Adverse	
41	016-0223	First Woodford Post Office	Caroline County	1874	This small frame office building is located immediately adjacent to the railroad and is associated with the Woodford Excelsior Company, Caroline County's first excelsior manufacturer. It was the focal point of the operation.	Eligible under Criteria A and C	No Adverse	
42	016-0222	Woodford Freight & Passenger Depot, Woodford Road	Caroline County	ca. 1900	The resource is a long, rectangular, one-story, framed building constructed circa 1900. The building served a combined function as both a freight depot and a passenger depot and was one of five original stops along the RF&P in Caroline County.	Eligible under Criteria A and C; Contributing to RF&P HD	No Adverse	
43	016-0220	Carolina Mansion, 11146 Woodford Road	Caroline County	ca. 1900	The ornate, two-and-a-half-story, wood framed dwelling was designed in the Queen Anne style with Classical detailing. The building represents housing constructed in the area in the early-twentieth century, when the RF&P and new manufacturing enterprises brought economic prosperity to the local region.	Potentially Eligible under Criterion C (Assuming eligible for undertaking)	No Effect	
44	016-5136	Milford Historic District	Caroline County	ca. 1880–1960	The district was originally established in the late-eighteenth century as a tobacco trading center. In 1836, the RF&P Railroad was constructed through the area and Milford soon became the largest of the small communities in the county situated along the railroad.	Eligible under Criteria A and C	No Adverse

RE: Project Effect- Addendum
Southeast High Speed Rail (DC2RVA) Project, Washington, D.C. to Richmond Segment
DHR #2014-0666

Dear Marc,

The Federal Railroad Administration (FRA) and the Virginia Department of Rail and Public Transportation (DRPT) are continuing environmental studies associated with the Tier II Environmental Impact Statement (EIS) for the Washington, D.C. to Richmond segment of the Southeast High Speed Rail (DC2RVA) corridor (Project). On June 20, 2018, the DC2RVA team submitted a summary of historic properties located in the Area of Potential Effects (APE) (n=118) and recommendations on project effect. Subsequent to the submittal of this document, three consulting party meetings were held to discuss the list of historic properties and effect determinations. The results of these meetings were discussed with you during a conference call between FRA, DRPT, your office, and the project team on July 2, 2018. During the dialogue, it was determined that one additional historic property is located in the APE based on consulting party comments: Masons' Hall in Richmond (127-0019). This brings the total number of historic properties for the DC2RVA project to 119 (see attached revised list). This letter presents a project effect recommendation for this additional resource. The recommendation is based on our July 2, 2018 dialogue.

Masons' Hall, located at 1815 Franklin Street, is a two-story, three-bay frame structure on a brick English basement built in 1785. It is the oldest continually operating Masonic lodge in the country. It is listed in the National Register of Historic Places (NRHP) under Criteria A and C. The lodge faces north onto Franklin Street. Current project plans include the possible construction of a parking garage one and a half blocks west of the resource. The closest point of the NRHP boundary to the proposed deck parcel is approximately 470 feet. While the upper segment of the parking garage may be partially visible from portions of the property, based on our July 2 call, it is believed that the project will not have the potential to diminish the characteristics that led this resource to be listed in the NRHP. Distance, vegetation, and other multistory buildings in the immediate area and the viewshed mask most of the proposed garage area from the primary viewshed of this resource. The tenants applied to this analysis parallel those used on other resources in this area as well as along other portions of the project area, such as in Fredericksburg where a parking garage is also proposed.

The remainder of the effect recommendations on individual resources and the project's overall effect on historic properties presented on June 20, 2018 remain unchanged.

We invite your agency to concur with these recommendations within 30 days of receipt of this letter. If you have questions about these effect recommendations or cultural resource studies for this project in general, please do not hesitate to contact Ms. Emily Stock, DRPT Project Manager, at (804) 591-4433 or via email at Emily.stock@drpt.virginia.gov, or me at (540) 899-9170 or via email at kbarile@dovetailcrg.com.

Sincerely,

Kerri S. Barile, Ph.D.
President, Dovetail Cultural Resource Group

Carey Burch, HDR
Stephen Walter, Parsons

The Virginia SHPO concurs that the Preferred Alternative for the DC2RVA project (DHR #2014-0666) will have **no adverse effect** on Masons' Hall (127-0019).

The project will have an **overall adverse effect on historic properties.**

46	016-0286	Coghill-Jeter Store, 22275 Penola Road; Penola, 16095 Polecat Lane	Caroline County	1880	The resource is a two-story, wood-framed commercial building. It is the only surviving commercial building in the largely abandoned village of Penola and is representative of the small country stores once found in crossroads communities and railroad stops throughout the area.	Eligible under Criteria A and C	No Adverse	47	042-0123	North Anna Battlefield	Hanover County	1864	The North Anna Battlefield was the location of one of the most important Civil War campaigns in the state. It was the culminating point of the 1864 Overland Campaign. The battlefield is composed of defensive earthworks and trenches, as well as other elements predating and contemporaneous with the battle.	Eligible under Criterion A	No Adverse	
48	042-5448	Doswell Historic District	Hanover County	ca. 1880-1940	Doswell Historic District encompasses a rural community that was once a center of major activity along road and rail networks. Nearly a dozen historic properties are located within the district’s boundaries.	Eligible under Criteria A and C	Adverse	
49	042-0093	Doswell Depot and Tower, 10577 Doswell Rd	Hanover County	ca. 1928	The current depot is a well-balanced design with classical-styled architectural features. The nearby, contemporaneous “HN tower” housed electrical systems managing an interlocking device permitting safe crossing of trains over both railroads.	Eligible under Criteria A and C; Contributes to RF&P HD and Doswell HD	Adverse	50	042-5307	Taylorsville Road Historic District	Hanover County	ca. 1900-1935	The community was settled in the early–nineteenth century and has remained active to present day. Most built features are residential and agricultural in nature within the district and reflect architectural styles and construction methods from the late-nineteenth to mid-twentieth century.	Eligible under Criteria A and C	No Adverse	
51	042-0556	Hoopers, 11108 McConnell Lane	Hanover County	1810	Resource was recorded during the LOD survey document but it was not accessible during the study; DHR suggested that it be considered potentially eligible for the project on April 4, 2018	Not evaluated; Not accessible (Assuming eligible for undertaking)	No Effect	
52	166-5073	Berkleytown Historic District	Hanover County	ca. 1900-1965	The district is typical of many small-town, twentieth-century, African-American neighborhoods in that it was relatively isolated from the formal downtown core and is dotted by small vernacular dwellings.	Eligible under Criterion A	Adverse	
53	166-0001	Ashland Historic District	Hanover County	1850-1950	The Ashland Historic District, with its large collection of late-Victorian and Edwardian frame dwellings and its brick commercial core, all set among hundreds of trees, survives as a fine example of a railroad and streetcar suburb preserving much of its turn-of-the-century character.	Listed under Criteria A and C	No Adverse	
54	166-0001-0015	Business Office, Randolph-Macon , 310 N. Center Street	Hanover County	ca. 1895	Historically known as the Blackwell House, it is an elaborate and outstanding example of Queen Anne-styled architecture with Eastlake elements in this historic community.	Potentially Eligible under C (Assuming eligible for undertaking); Contributing to Ashland HD	No Effect	
N-S Order	DHR ID	Name/Description	City/County	Date / Time Period	Description	NRHP Eligibility	DHR Effect Determination	Image
55	166-5072	Randolph-Macon College Historic District Expansion	Hanover County	ca. 1900-1960	The Randolph-Macon College Historic District Expansion highlights a significant part of campus that developed between the early-twentieth century up to the mid-1960s when a substantial building boom occurred.	Potentially Eligible under Criteria A and C (Assuming eligible for undertaking)	No Effect	
56	166-0002	Randolph-Macon College Historic District	Hanover County	1872-1950	The district includes the 85-acre college campus and all associated buildings, structures and landscape features. This is the oldest Methodist-related college in the United States still in operation	Listed under Criteria A and C	No Effect	
57	166-0001-0008	Ashland Station Depot, 112 N. Railroad Avenue	Hanover County	1910	The one-story, five-bay, brick depot is said to have been designed by W. P. Lee to replace a previous circa-1890 station that had burned. The building appears little altered and is a good example of a Colonial Revival-styled depot.	Potentially Eligible under A and C (Assuming eligible for undertaking); Contributing to Ashland HD	No Effect	58	166-5041	Priddy House, 107 Stebbins Street	Hanover County	ca. 1926	This one-and-a-half-story, four-bay, single-family dwelling is an outstanding example of Craftsman-styled domestic architecture in this community.	Potentially Eligible under Criterion C (Assuming eligible for undertaking); Contributing to Ashland HD	No Effect	59	166-0001-0055	Emily Gray House, 702 S. Center Street	Hanover County	ca. 1850	Historically known as the Emily Gray House, this one-and-a-half-story, three-bay resource is an outstanding example of Second Empire-styled architecture.	Potentially Eligible under Criterion C (Assuming eligible for undertaking); Contributing to Ashland HD	No Effect	60	166-0001-0060	Fleming Fox House, 708 S. Center Street	Hanover County	ca. 1894	Historically known as the Fleming Fox House, this two-and-a-half-story, four-bay dwelling is an outstanding example of a Colonial Revival-styled dwelling with Free Classic elements.	Potentially Eligible under Criterion C (Assuming eligible for undertaking); Contributing to Ashland HD	No Effect	61	166-0036	MacMurdo House, 713 S. Center Street	Hanover County	ca. 1858	This two-story, three-bay, Greek Revival, single-family dwelling is one of the few buildings of its style in Ashland, and it has excellent historic integrity.	Potentially Eligible under Criterion C (Assuming eligible for undertaking); Contributing to Ashland HD	No Effect	62	166-0037	Hugo House/Lefebvre House, 904 S. Central Street	Hanover County	ca. 1886	This two-story, three-bay, Queen-Anne, frame dwelling is an elaborate and outstanding example of Queen Anne-styled architecture in the community.	Potentially Eligible under Criterion C (Assuming eligible for undertaking); Contributing to Ashland HD	No Effect	63	166-0001-0077	House, 1005 S. Center Street	Hanover County	ca. 1890	This two-and-a-half-story, four-bay, Folk Victorian dwelling possesses characteristics of Queen Anne while its form and orientation suggest an earlier construction date.	Potentially Eligible under Criterion C (Assuming eligible for undertaking); Contributing to Ashland HD	No Effect

RE: Project Eligibility and Effect- Addendum #2
Southeast High Speed Rail (DC2RVA) Project, Washington, D.C. to Richmond Segment
DHR #2014-0666

Dear Marc,

The Federal Railroad Administration (FRA) and the Virginia Department of Rail and Public Transportation (DRPT) are continuing environmental studies associated with the Tier II Environmental Impact Statement (EIS) for the Washington, D.C. to Richmond segment of the Southeast High Speed Rail (DC2RVA) corridor (Project). On June 20, 2018, the DC2RVA team submitted a summary of historic properties located in the Area of Potential Effects (APE) (n=118) and recommendations on project effect. This list of historic properties was based on three years of technical studies and correspondence and meetings with consulting parties. Your agency concurred with the list of historic properties and effect determinations in a letter dated June 28, 2018.

Three additional consulting party meetings were concurrently held in June 2018 to discuss this list of historic properties and effect determinations. Based on these meetings, one additional historic property was added to the roster: Masons' Hall in Richmond (127-0019). The total number of historic properties was revised to be 119. A revised effect determination letter was submitted on July 9, 2018 and your concurrence was received on July 18, 2018.

Since submitting the revised effect determination, one design change has been made to the Project. A three-story parking deck proposed to be constructed east of Main Street Station in Richmond has been removed, along with associated roadway modifications. In addition, a third round of consulting party meetings and associated conference calls was held in October 2018 and additional feedback on historic properties and effect were received. All feedback received in meetings, via email, through telephone calls, and as hard-copy letters has been evaluated and thoroughly discussed with the FRA, DRPT, Advisory Council on Historic Preservation (ACHP), and the Virginia Department of Historic Resources (DHR), as well as with the consulting parties.

Dialogues associated with the Project redesigns and extensive feedback have resulted in additional modifications to the list of historic properties and project effect. In sum, two related resources have been evaluated as a potential Traditional Cultural Property (TCP) (Lumpkin's Jail/Devil's Half Acre Site [44HE1053] and "Burial Ground for Negros" [44HE1089]), two archaeological sites have been added to the list of historic properties (Lumpkin's Jail/Devil's Half Acre Site [44HE1053] and Grave Yard for Free People of Color and Slaves [44HE1203]), one resource has been removed from the list of historic properties (site 44HE0357), and one resource has a recommended effect change (Railroad Y.M.C.A. [127-0344-0123]). Additional details on these resources are below. In total, with these changes, the number of historic properties in the APE has increased to 120.

Lumpkin's Jail/Devil's Half Acre site (44HE1053) and "Burial Ground for Negros" (44HE1089)

The Lumpkins Jail/Devil's Half Acre site (44HE1053) is located west of Main Street Station in Shockoe Bottom (Figure 1 and Figure 2). The "Burial Ground for Negros" (44HE1089) is located nearby, north of Broad Street and east of I-95. On July 20, 2018, the National Trust for Historic Preservation (NTHP) submitted a letter to DRPT stating that they believed that the two sites, as well as several to-be-recorded resources, comprised a TCP representing the Richmond slave trade. Since receipt of their letter, FRA and DRPT have held numerous meetings with the DHR, ACHP, and consulting parties to evaluate this area as a potential TCP. They have also conducted extensive research and coordination on TCPs in general, TCPs in Virginia, and the Shockoe area as a TCP in particular, to assure that all avenues have been explored. According to the National Park Service (NPS), a TCP is: "a property that is eligible for inclusion in the National Register based on its associations with the cultural practices, traditions, beliefs, lifeways, arts, crafts, or social institutions of a living community. TCPs are rooted in a traditional community's history and are important in maintaining the continuing cultural identity of the community." Data gathered as part of the TCP review has been discussed with the FRA, DRPT, ACHP, and DHR to solicit their input and ascertain the path forward. Based on this consultation, FRA recommends that the Shockoe area does not meet the definition of a TCP based on the extant information at hand and its interpretation of this type of resource.

Beyond considering this area as a TCP, the NTHP also requested that both Lumpkin's Jail/Devil's Half Acre and Burial Ground for Negros should be included in the (APE). The APE was initially coordinated with the DHR in February 2015. The extent was based on the previous Richmond to Raleigh High Speed Rail study and included different APEs for above- and below-ground resources. Based on cultural resource studies, modifications to the project design, and input from consulting parties, the APE has been modified since that time to include resources wherein the Project has the potential to impact character-defining features of a resource. The NTHP stated that the APE is inconsistent with Section 106 regulations and requested that the APE in Shockoe be enlarged to include the Lumpkin's Jail Site (44HE1053) and the Burial Ground for Negros (44HE1089).

Expansion of the APE in this area was discussed extensively with involved agencies and presented to consulting parties on October 12, 2018. Through these dialogues, it is recommended that the APE should be expanded to include the Lumpkin's Jail Site but not the Burial Ground for Negros. Although numerous archaeological studies have been completed to locate the Burial Ground for Negros, no physical evidence of this site has yet to be uncovered. As such, the data potential and significance of this site is unknown, and this site is not included in the APE. Archaeological studies at Lumpkin's Jail/Devil's Half Acre occurred in 2006 and 2008 and features and artifacts representing Richmond's slave trade were uncovered beneath over 10 feet of fill. Although the site has not received a formal eligibility determination from the DHR, based on numerous dialogues and meetings regarding this resource, the FRA and DRPT are including the site in APE and assuming eligibility of this site under Criterion A for its association with the slave trade industry and under Criterion D as an archaeological site for its ability to provide information on area history.

In addition to examining its inclusion in the APE, FRA also evaluated the potential project effect on this historic property. As a resource assumed eligible under Criterion A, the applicable aspects of integrity that render an association with the slave trade are location, design, materials, workmanship, and association. None of these aspects will be altered by the current Project. While the Project may alter the integrity of setting and feeling of the resource due to the widening of one rail platform by approximately 15 feet and increase in train traffic, these two aspects of integrity do not contribute to the overall eligibility of the site as they have been severely impacted over many years by the channeling of Shockoe Creek, construction of I-95, and other large-scale development and re-development in this area (Figure 3 and Figure 4).

Regarding Criterion D, the site is located over 300 feet west of the closest project element, and no subsurface disturbance will occur within or near the site boundaries (see Figure 2). Regardless, FRA and DRPT are committed to completing archaeological monitoring and data recovery in all areas where subsurface construction activities for the Project are required in the vicinity of this site and Main Street Station. Archaeological excavations will be completed prior to construction should artifact-bearing deposits associated with this site, or the slave trade in general, be located in the Project's limits of disturbance. Through this commitment and due to the extant diminished setting and feeling of the resource site, it is recommended that the Project will have no adverse effect on this resource. This recommendation reflects National Park Service Bulletin 36 (p. 19) regarding archaeological sites that are eligible under multiple criteria. Despite this recommendation, the FRA and DRPT recognize the importance of this site and acknowledge the history of this area, specifically as it relates to the slave trade. As such, the site is being considered a contributing element to the surrounding Shockoe Valley and Tobacco Row Historic District (127-0344) as part of this Project, and mitigation to the adverse effects on this district (as determined by your office in June 2018) will include stipulations associated with this significant site and its value as an important piece of Richmond's past.

Grave Yard for Free People of Color and Slaves (site 44HE1203)

The Grave Yard for Free People of Color and Slaves (site 44HE1203) is located north of Hospital Street. The site represents a cemetery established around 1816 and in use until the mid-nineteenth century. The area has been repeatedly modified in the twentieth century, including the construction of a gas station on a portion of the lot. There is no above-ground evidence of the site. Archaeological studies to identify portions of the cemetery were conducted several times by the Virginia Department of Transportation, but no physical evidence was uncovered. Due to its presence on numerous historic maps, though, the resource was recorded as an archaeological site during the DC2RVA Project and determined to be potentially eligible for the NRHP under Criterion D; the site's boundaries were determined based on historic map projections. Although the DHR concurred with DRPT's initial eligibility assessment in a letter dated June 12, 2018 that the portion of the site within the APE does not contribute to the eligibility of this resource, FRA and DRPT have elected to include the overall site within the roster of historic properties based on consulting party comments.

Using available data on the site's boundaries, the project team reworked roadway plans in this area to avoid any portion of the site that may have intact soils (Figure 5). The northern limit of disturbance for modifications to Hospital Street was reduced to parallel the existing street cut—an area that is already disturbed. Through this action, the Project now avoids areas of the site with any likely potential to contain interments or other significant archaeological deposits. It is recommended that the Project will have no adverse effect on this resource.

Site 44HE0357

Site 44HE0357 represents the archaeological remains of a late-eighteenth through nineteenth century privy and backyard complex. The site is located east of Main Street Station in Shockoe Bottom. The original effect determination was predicated on the construction of a parking deck in this area, which would have resulted in adverse effects to significant archaeological deposits. With the removal of the parking deck, this site is no longer in the APE as no construction activities are located within or near the site (see Figure 1 and Figure 2).

Railroad Y.M.C.A. (127-0344-0123)

The Railroad Y.M.C.A. (127-0344-0123) at 1552 East Main Street is a circa 1907 building constructed to provide recreational space for railroad workers and their families in the area. Previous plans for the Project included a multistory parking deck immediately to the rear of this building, which had the potential to diminish its integrity of setting, feeling and association resulting in an adverse effect determination. Due to the removal of the parking deck from project plans, no major project structural elements are in the general viewshed of this resource. Project plans do include addition of new platforms extending outward 15 feet alongside the existing rail viaduct and train shed on both the east and west sides of Main Street Station. These minimal changes will not diminish the characteristics that render this resource eligible for the NRHP (see Figure 2 for limits of disturbance in this area). As such, it is recommended that the Project will now have no adverse effect on this resource.

The remainder of the effect recommendations on individual resources and the Project's overall effect on historic properties presented on June 20, 2018 and July 9, 2018 remain unchanged. The attached table represents a full compendium of all 120 resources and effect determinations.

We invite your agency to concur with these recommendations within 30 days of receipt of this letter. If you have questions about these effect recommendations or cultural resource studies for this Project in general, please do not hesitate to contact Ms. Emily Stock, DRPT Project Manager, at (804) 591-4433 or via email at Emily.stock@drpt.virginia.gov, or me at (540) 899-9170 or via email at kbarile@dovetailcrg.com.

Sincerely,

Kerri S. Barile, Ph.D.
President, Dovetail Cultural Resource Group

The Virginia SHPO concurs that Lumpkin's Jail/Devil's Half Acre, Burial Ground for Negros, and the surrounding area do not meet the criteria of a Traditional Culural Property. They also concur that Lumpkin's Jail/Devil's Half Acre is within the APE of the DC2RVA Project (DHR #2014-0666) but Burial Ground for Negros is not wihtin the APE. The SHPO additionally concurs that the Preferred Alternative for the DC2RVA project will have no adverse effect on the Lumpkin's Jail/Devil's Half Acre site (44HE1053), Grave Yard for Free People of Color and Slaves (site 44HE1203), and Railroad Y.M.C.A. (127-0344-0123). Site 44HE0357 has been removed from the APE.

The project will continue to have an overall adverse effect on historic properties**.**

1	500-0001	Richmond, Fredericksburg, and Potomac Railroad	Arlington County, City of Alexandria, Fairfax County, Prince William County, Stafford County, City of Fredericksburg, Spotsylvania County, Caroline County, Hanover County, Henrico County, City of Richmond	1836-1943	The RF&P opened in 1836 and eventually spanned from the Potomac River to Richmond. The corridor includes the main rail line, spurs, and associated elements such as station houses, bridges, and other structures.	Eligible under Criterion A	Adverse	
2	029-0218	Mount Vernon Memorial Highway (portion of George Washington Memorial Parkway)	Fairfax County, Arlington County	ca. 1929	The Mount Vernon Memorial Highway is an 8 ½-mile section of the George Washington Memorial Parkway from Fairfax County to the southern boundary of Alexandria. The four-lane wide highway was constructed with concrete slab construction and while much of the concrete remains intact.	Listed under Criteria A and C	No Adverse	
3	000-0045	Washington National Airport (Reagan National Airport)	Arlington County	1941	The primary/historic building is a four-story, multi-bay, airline passenger terminal constructed in the Moderne style. Property also includes six c 1941 airplane hangers and associated runways and other landscape elements.	Listed under Criteria A and C	No Adverse	
4	100-0160	George Washington Junior High School, 1005 Mt. Vernon Avenue	City of Alexandria	1935	The resource is a three-story, multi-bay school building constructed in the Art Deco style originally in a rectangular form. The building is constructed of large, cut, grey sandstone and brick laid in an irregular bond.	Potentially Eligible under C (Assuming eligible for undertaking)	No Effect	
5	100-0133	Parker-Gray Historic District/Uptown	City of Alexandria	ca. 1810	The district covers over 45 blocks in the northwestern quadrant of Old Town Alexandria and abuts the Alexandria Historic District. It consists mainly of small row houses and townhomes built in the mid-to-late nineteenth century.	Listed under Criteria A and C	No Adverse	
6	100-0137	Rosemont Historic District	City of Alexandria	ca. 1900	The district is a planned, residential subdivision that is located northwest of Old Town Alexandria. It consists mainly of small, middle-class houses built between 1908 and 1940.	Listed under Criteria A and C	No Adverse	
7	100-0124	Alexandria Depot, 110 Callahan Drive	City of Alexandria	1905	The train depot known as Alexandria Union Station at 110 Callahan Drive is a one-and-one-half-story, multi-bay, passenger depot constructed in the Colonial Revival style	Listed under Criteria A and C	No Adverse	
8	100-0128	George Washington National Masonic Memorial	City of Alexandria	ca. 1922	The resource at 101 Callahan Drive is a nine-story, multi-bay, memorial and museum sitting on a designed knoll constructed in the Classical Revival style.	Listed under Criterion C and Criteria Consideration F	No Effect	
9	100-0277	Phoenix Mill, 3642 Wheeler Avenue	City of Alexandria	ca. 1776	The building is a two-story, three-bay, industrial building. It is purportedly the “sole remaining example of a mill structure in Alexandria.”	Eligible under Criteria A and C	No Adverse	

N-S Order	DHR ID	Name/Description	City/County	Date / Time Period	Description	NRHP Eligibility	DHR Effect Determination	Image
10	029-0953	Old Colchester Road, Potomac Path, King's Highway	Fairfax County	ca. 1664	This two-lane asphalt road runs northeast from the Occoquan River for approximately 4 miles to the intersection with Route 1 in Lorton. Old Colchester Road played an important role in the county's early transportation history.	Eligible under Criterion A	No Effect	
11	029-0043	Colchester Arms, Fairfax Arms, 10712 Old Colchester Road	Fairfax County	ca. 1756	The building ais a one-and-a-half story, four-bay tavern constructed with an irregular four-room plan. The timber-framed structural system rests on a continuous, raised-basement, stone foundation.	Listed under Criteria A and C	No Adverse	
12	500-0001-0022	RF&P Bridge over Occoquon River	Prince William County	1915	The resource is a through-truss, camelback railroad bridge constructed close to the middle of the height of this type of structure, 1870-1930. Although once common, few have survived.	Eligible under Criterion C; Contributing to RF&P HD	Adverse	500-0001-0022
13	076-0023	Rippon Lodge	Prince William County	1747	One of the oldest houses in Prince William County, the vista from Rippon Lodge looking down Neabsco Creek (and future site of the railroad) was documented by Benjamin Latrobe.	Listed under Criteria A and B	Adverse	
14	44ST1223	Civil War Campsite	Stafford County	1862-1863	This site represents a Civil War campsite occupied during the winter of 1862–1863 when the Union Army was ordered into winter quarters.	Potentially Eligible under Criteria A and D (Assuming eligible for undertaking)	Adverse	
15	111-0147	Fredericksburg & Spotsylvania Co. Battlefields National Military Park & Cemetery, Lee Drive	City of Fredericksburg	1862	The resource is a Civil War battlefield park composed of earthworks, cannons, and informational markers in addition to a total of 429 non-archaeological cultural resources, 350 of which are considered contributing to its significance.	Listed under Criteria A and D	No Adverse	
16	111-5295	Battle of Fredericksburg I	City of Fredericksburg	1862	The battlefield is the location of a Civil War battle that occurred between December 11 and December 15, 1862. Union Major General Ambrose Burnside and his troops battled General Robert E. Lee's Confederate men, resulting in a Confederate victory. The battlefield continues to retain a high level of integrity.	Eligible/Potentially Eligible under Criterion A	No Adverse	
17	111-5296	Battle of Fredericksburg II	City of Fredericksburg	1863	The Battlefield is a 12,694.2-acre battlefield associated with a Civil War battle of the same name, which took place on May 3, 1863. Despite expansive residential, commercial, and industrial development around the battlefield and the Fredericksburg, it continues to retain a high level of integrity	Eligible/Potentially Eligible under Criterion A	No Adverse	
18	111-0132-0025	Rappahannock River Railroad Bridge and Associated Structures/Platform	City of Fredericksburg	1927	This multiple-span, open-spandrel, concrete-arch bridge is an excellent and rare surviving example of a reinforced-concrete arch railroad bridge within this region of Virginia. It was erected when the station and tracks were elevated for automobile traffic pass through in downtown Fredericksburg.	Eligible under Criterion C; Contributing to Fredericksburg HD and RF&P HD	Adverse	111-0132-0025

N-S Order	DHR ID	Name/Description	City/County	Date / Time Period	Description	NRHP Eligibility	DHR Effect Determination	Image
19	44SP0187	Bridge/Marye's Mill	City of Fredericksburg	19th century	Terrestrial portion of the site occupies the location of Marye's Mill, depicted in an 1863 photograph taken during the Second Battle of Fredericksburg and mills identified on Gray's (1878) map of late-nineteenth-century Fredericksburg. Includes cut stone piers that are now located under the waters of the Rappahannock River, which may be associated with earlier railroad structures that are no longer extant.	Potentially Eligible under Criteria A and D (Assuming eligible for undertaking)	Adverse	
20	111-0132	Fredericksburg Historic District	City of Fredericksburg	post 1727	The district is a 200-acre area that comprises the city's downtown commercial area, adjacent industrial area, and some of the surrounding residential blocks. This part of Fredericksburg boasts a wide variety of infrastructure that ranges in date from the early eighteenth century throughout the late twentieth century	Listed under Criterion C	Adverse	
21	44SP0688	Block 49/Train Station	City of Fredericksburg	Late Archaic; 19th/20th c	Archaeological remains of several dwellings, outbuildings, and industrial features as identified by UMW in the early 1990s	Potentially Eligible under Criteria A and D (Assuming eligible for undertaking)	Adverse	
22	111-0067/ 111-0132-0505	Dr. Charles Mortimer House, House, 213 Caroline Street	City of Fredericksburg	1764-1801	The home is a two-story, five-bay, Federal-style single-family dwelling built circa 1764 in the Georgian style. Dr. Charles Mortimer was an important figure in Fredericksburg's history. The house is also one of a handful of high-style Georgian buildings in Fredericksburg and it is the only example with its original outbuildings.	Eligible under Criteria B and C; Contributing to Fredericksburg HD	No Effect	23	111-0132-0458	Robert Adams Residence, 528 Caroline Street	City of Fredericksburg	1891	The two story, two-bay resource was built in 1891 as a high-style Italianate dwelling. No other high-style, Italianate dwellings are located within the boundaries of the Fredericksburg Historic District.	Eligible under Criterion C; Contributing to Fredericksburg HD	No Effect	24	111-0132-0147	Shiloh Baptist Church New Site, 521 Princess Anne Street	City of Fredericksburg	1890-1968	This 2-story, multi-bay, Colonial Revival-style church was constructed in 1890 and has been an important part of the ante- and post-bellum, African-American community, playing a role in early African-American education and the Civil Rights Movement in Fredericksburg.	Eligible under Criteria A and C and Criteria Consideration A; Contributing to Fredericksburg HD	No Effect	25	44SP0687	Block 48/Train Station	City of Fredericksburg	Late Archaic; 19th/20th c	Archaeological remains of several dwellings, outbuildings, and industrial features as identified by UMW in the early 1990s	Potentially Eligible under Criteria A and D (Assuming eligible for undertaking)	Adverse	
26	111-0132-0704	Fredericksburg Train Station, 200 Lafayette Boulevard	City of Fredericksburg	1910	The depot is a two-story, five-bay building constructed in the Neoclassical style designed by notable local architect Peck Heflin. The adjacent rail tracks were raised in 1927.	Eligible under Criteria A and C; Contributing to Fredericksburg HD	No Adverse	27	111-0132-0126	The 1770 House, 227 Princess Anne Street	City of Fredericksburg	1770	The home is a one-and-one-half-story dwelling constructed circa 1770 in the Tidewater tradition with some Georgian-style elements. It is a unique example of an eighteenth-century, working-class home in this part of town.	Potentially Eligible under Criterion C (Assuming eligible for undertaking); Contributing to Fredericksburg HD	No Effect	
N-S Order	DHR ID	Name/Description	City/County	Date / Time Period	Description	NRHP Eligibility	DHR Effect Determination	Image
28	111-0132-0020	Purina Tower	City of Fredericksburg	1916	The resource is a one-and-one-half story commercial building with a tall grain elevator at the northwest corner. The tower has become an important landscape landmark within the community.	Eligible under Criteria A and C; Contributing to Fredericksburg HD	No Adverse	111-0132-0020
29	111-0132-0522	House, 314–316 Frederick Street	City of Fredericksburg	1851	This is a two-story, four-bay vernacular brick duplex. Oral history states that the building was used as a slave jail in the antebellum period.	Eligible under Criteria A and B; Contributing to Fredericksburg HD	No Adverse	111-0132-0522
30	111-0009-0795	Pulliam's Service Station, 411 Lafayette Boulevard	City of Fredericksburg	ca. 1937	This resource is a one-story filling station constructed in the Spanish Revival style. It still retains its original materials and configuration.	Eligible under Criteria A and C; Contributing to Fredericksburg HD	No Adverse	111-0009-0795
31	111-0009	Fredericksburg Historic District Extension	City of Fredericksburg	1794-1967	The district extension is a large area that includes a wide variety of resources immediately surrounding the city's downtown core including residences, commercial buildings, and churches dating to the 19th and 20th c.	Eligible under Criteria A and C	No Adverse	
32	088-5181	Salem Church Battlefield (Banks Ford Battlefield)	Spotsylvania County, City of Fredericksburg	1863	The battlefield includes the land where Hay's and Hoke's brigades attacked the Union Sixth Corps in 1863. It includes Confederate earthworks, Salem Church, and the path of the Plank Road.	Eligible under Criterion A	No Adverse	
33	088-5364	Virginia Central Railway Historic District	City of Fredericksburg, Spotsylvania County, and more	1853	The district is a 38-mile-long railroad corridor that extends west from the CSX railroad (formerly the RF&P) in Fredericksburg to the town of Orange encompassing rail-related structures, sites, and landscape features. The 3.5-mile long eastern section is eligible.	Eligible under Criterion A	No Adverse	
34	111-0145	Fredericksburg Gun Manufactory	City of Fredericksburg	ca. 1775	The Fredericksburg Gun Manufactory is an archaeological site that is at least 75 percent intact. The remains of the manufacturing facility are located beneath a paved asphalt parking lot for a public school.	Listed under Criteria A and D	No Adverse	
35	088-0254	Slaughter Pen Farm, 11232 Tidewater Trail (Wayside Farm or Pierson Farm)	Spotsylvania County	ca. 1861	Slaughter Pen Farm, also known as Wayside Farm or Pierson Farm, is a 19th century farm complex composed of a two-story, three-bay, Italianate-style, single-family dwelling, three agricultural outbuildings, a shed, one kitchen, a slave quarters, and a well.	Eligible under Criterion A	No Adverse	
36	44SP0468	Earthwork/ Jackson's Earthwork	Spotsylvania County	1861	This resource includes a set of earthworks within a larger archaeological site. The area is almost totally enclosed by lines of military shelter trenches constructed prior to or following the First Battle of Fredericksburg.	Potentially Eligible under Criteria A, C and D (Assuming eligible for undertaking)	Adverse	

N-S Order	DHR ID	Name/Description	City/County	Date / Time Period	Description	NRHP Eligibility	DHR Effect Determination	Image
37	088-0039	La Vue, 3232 LaVue Lane (Prospect View)	Spotsylvania County	ca. 1848	La Vue, also known as Prospect View, is a two-story, three-bay, single-family dwelling constructed in the Greek Revival style with an L-plan.	Listed under Criterion C	No Adverse	
38	016-0092	Fairfield Plantation Office, Jackson Shrine, 12019 Stonewall Jackson Road	Caroline County	1828	The resource is a one-and-a-half-story frame building; it once served as the office for the 740-acre Fairfield Plantation and is the only surviving building. On May 10, 1863, Confederate General Thomas Jonathan "Stonewall" Jackson died at the site after being wounded at the Battle of Chancellorsville.	Eligible under Criteria A and C	No Adverse	
39	016-0208	House, 12096 Guinea Drive	Caroline County	ca. 1900	The resource is a is a one-and-a-half-story vernacular dwelling with Queen Anne and Craftsman elements. The house was built from a kit purchased from the Sears & Roebuck Company.	Potentially Eligible under Criterion C (Assuming eligible for undertaking)	No Effect	
40	016-5165	Excelsior Industry of Caroline County MPD	Caroline County	ca. 1925-1960	This is a thematic collection of resources that are associated with the manufacture of excelsior, Caroline County's largest industry in the early twentieth century	Eligible under Criteria A and C	No Adverse	
41	016-0223	First Woodford Post Office	Caroline County	1874	This small frame office building is located immediately adjacent to the railroad and is associated with the Woodford Excelsior Company, Caroline County's first excelsior manufacturer. It was the focal point of the operation.	Eligible under Criteria A and C	No Adverse	
42	016-0222	Woodford Freight & Passenger Depot, Woodford Road	Caroline County	ca. 1900	The resource is a long, rectangular, one-story, framed building constructed circa 1900. The building served a combined function as both a freight depot and a passenger depot and was one of five original stops along the RF&P in Caroline County.	Eligible under Criteria A and C; Contributing to RF&P HD	No Adverse	
43	016-0220	Carolina Mansion, 11146 Woodford Road	Caroline County	ca. 1900	The ornate, two-and-a-half-story, wood framed dwelling was designed in the Queen Anne style with Classical detailing. The building represents housing constructed in the area in the early-twentieth century, when the RF&P and new manufacturing enterprises brought economic prosperity to the local region.	Potentially Eligible under Criterion C (Assuming eligible for undertaking)	No Effect	
44	016-5136	Milford Historic District	Caroline County	ca. 1880–1960	The district was originally established in the late-eighteenth century as a tobacco trading center. In 1836, the RF&P Railroad was constructed through the area and Milford soon became the largest of the small communities in the county situated along the railroad.	Eligible under Criteria A and C	No Adverse	
45	016-0270	Milford State Bank, 15461 Antioch Road	Caroline County	ca. 1910	The bank is a two-story brick building constructed in the Classical Revival style. The building's façade is divided into five distinct bays via brick pilasters. It is the only Classical Revival building as well as the only bank in the village of Milford.	Potentially Eligible under Criterion C (Assuming eligible for undertaking)	No Adverse

104	127-6213	Davee Gardens Historic District	City of Richmond	1947	This district is a planned, symmetrical suburb of Richmond, established in 1947. Homes in the neighborhood retain a high degree of historic integrity, and the street plan is emblematic of post World War II design.	Eligible under Criteria A and C	No Adverse	
105	127-5818	Philip Morris Operations Complex, 3601 Commerce Road	City of Richmond	1959–1974	This is a mid-twentieth-century, light-industrial complex that serves as headquarters for the company’s tobacco production. They are unique industrial-related building constructed in the post-modern Neoexpressionist and Brutalist styles.	Eligible under Criteria A and C and Criteria Consideration G	No Adverse	
106	020-5474	DuPont Spruance	Chesterfield County	1929	The first of several buildings on the DuPont Spruance Plant was constructed under the ownership DuPont Rayon Co. This large factory has played a significant role in the development of textiles and plastics in the United States.	Eligible under Criteria A and C	No Effect	
107	043-0307	Battle of Chaffin's Farm (New Market Heights Battlefield), New Market Road	Chesterfield County, Henrico County, City of Richmond	1862	The Battle of New Market Heights is nationally significant because of the all-important role played by Black soldiers in this fight and the recognition of their gallantry by the United States government through the award of 14 Medals of Honor to participants.	Eligible under Criterion A	No Adverse	
108	020-0063	Falling Creek Ironworks Archaeological Site	Chesterfield County	1619	The Falling Creek Ironwork archaeological site was originally recorded as the location of the Virginia Company Ironworks. Subsequent investigation suggests that it could also be Cary's Ironworks, destroyed in 1781 during the American Revolution.	Listed under Criterion D	No Adverse	

N-S Order	DHR ID	Name/Description	City/County	Date / Time Period	Description	NRHP Eligibility	DHR Effect Determination	Image
109	020-5320	Proctor's Creek Battlefield	Chesterfield County, Colonial Heights	1864	Currently the battlefield consists of monuments, interpretive markers (state and freeman markers/park service interpretation at Fort Darling unit/county interpretation at Fort Stephens), a cemetery, historic road beds, period structures (Wooldridge, Willis, Halfway houses), and trenches/field fortifications.	Eligible/Potentially Eligible under Criterion A	No Adverse	020-5320 S 11 PROCTOR'S CREEK FIGHT
110	020-0147	Drewry's Bluff Battlefield (Fort Darling, Fort Drewry), Fort Darling Road	Chesterfield County, Henrico County	1862	Drewry's Bluff encompasses 42.4 acres of land. The CCC camp based at Fort Harrison rehabilitated the site in 1935, clearing brush and trees and stabilizing the earthworks.	Eligible under Criterion A	No Adverse	
111	123-5025	Assault on Petersburg (Petersburg Battlefield II), Bermuda Hundred Road (Alt Route 697)	Charles City County, Chesterfield County, City of Colonial Heights, City of Hopewell, City of Petersburg, Prince George County	1865	This resource includes a Civil War battlefield that represents part of the Richmond Petersburg campaign in and around Petersburg. Today, the battlefield consists of earthworks, roadways, and other features as well as interpretive materials.	Eligible under Criterion A	No Adverse	
112	020-5336	The Bellwood-Richmond Quartermaster Depot Historic District, US Department of Defense Supply Center Historic District	Chesterfield County	post-1942	The district is a group of residential, industrial, and military buildings dating from the construction Sheffield/Bellwood Manor (020-0007), circa 1804, to the development of the Korean Conflict era buildings in 1952	Eligible under Criteria A, B, C, D	No Adverse	
113	020-0007	Bellwood, Sheffields, Auburn Chase, Building 42, Defense Supply Center Richmond, 8000 Jefferson Davis Hwy	Chesterfield County	1804	This resource is significant as a representative of an early-nineteenth century antebellum plantation that has evolved into a modern, twentieth-century farm and dairying operation. The main house is an excellent example of vernacular interpretation of the Early Classical Revival style in the piedmont area constructed in an I-form. Numerous archaeological resources are located on the parcel.	Listed under Criteria A, C, and D	No Adverse	
114	44CF0680 / 020-0022	Fort Darling/Battlefield, Earthworks, Fort/ Centralia Earthworks	Chesterfield County	1861-1865	The earthworks were developed by Confederate troops as part of the Outer Line of defenses for Drewry's Bluff. Although some segments of the earthworks has been destroyed, the extant areas remain in excellent condition and the remaining elements of the artillery battery, trenches, and gun emplacements are representative of earthworks developed in this area during the Civil War.	Eligible under Criteria A, C, and D	No Adverse	
115	020-5351	Richmond & Petersburg Electric Railway	Chesterfield County	1902	This resource contains the alignment of the regional trolley system. Creation of this line was the direct impetus for large-scale modifications to settlement patterns in central Virginia.	Eligible under Criterion A	No Adverse	
116	020-0013	House, 3619 Thurston Road	Chesterfield County	1913	This resource is a 1.5-story Colonial Revival dwelling with a gambrel roof and flared eaves. It retains a high degree of architectural integrity.	Eligible under Criterion C	No Effect	
117	127-6251	Atlantic Coast Line Railroad Corridor, Richmond and Petersburg Railroad	City of Richmond, Chesterfield County	post 1833	Historic railroad corridor that represents the origins and growth of the railroad industry in the Richmond to Petersburg corridor; reflects the post-Civil War trend of merging smaller operations to provide better service while being more economical	Eligible under Criterion A	No Adverse

118	020-5378	VEPCo Power Transmission Line	Chesterfield County	ca. 1910	The VEPCo Line was built The line was built sometime between 1910 and 1930, likely between 1925 and 1927, providing high-voltage electric power service to the people in the area. It is approximately one mile long, and it is the only remaining portion of the line that once extended from Richmond to Petersburg.	Eligible under Criteria A and C	No Effect	
119	020-0140	Circle Oaks/4510 Centralia Road	Chesterfield County	1840	This resource is a two-story, wood frame single-family dwelling featuring a two-story, wrap around veranda. Property includes a small tenant house (perhaps servant's quarters) and a kitchen. Circle Oaks is the oldest and largest building in the community.	Eligible under Criterion C	No Adverse	120	020-0552	Centralia Post Office	Chesterfield County	1905	The one-story building was the center of the community of Centralia. It was constructed to face east onto the rail tracks to accommodate rail travelers through this area during the economic boom of the pre-World War I days.	Eligible under Criterion A	No Adverse	
DC TO RICHMOND
SOUTHEAST HIGH SPEED RAIL

600 E. Main Street, Suite 1200
Richmond, VA 23219

November 20, 2018

Mr. Marc Holma
Division of Review and Compliance
Department of Historic Resources
2801 Kensington Avenue
Richmond, Virginia 23221

RE: Project Eligibility and Effect- Addendum #2
Southeast High Speed Rail (DC2RVA) Project, Washington, D.C. to Richmond Segment
DHR #2014-0666

Dear Marc,

The Federal Railroad Administration (FRA) and the Virginia Department of Rail and Public Transportation (DRPT) are continuing environmental studies associated with the Tier II Environmental Impact Statement (EIS) for the Washington, D.C. to Richmond segment of the Southeast High Speed Rail (DC2RVA) corridor (Project). On June 20, 2018, the DC2RVA team submitted a summary of historic properties located in the Area of Potential Effects (APE) (n=118) and recommendations on project effect. This list of historic properties was based on three years of technical studies and correspondence and meetings with consulting parties. Your agency concurred with the list of historic properties and effect determinations in a letter dated June 28, 2018.

Three additional consulting party meetings were concurrently held in June 2018 to discuss this list of historic properties and effect determinations. Based on these meetings, one additional historic property was added to the roster: Masons' Hall in Richmond (127-0019). The total number of historic properties was revised to be 119. A revised effect determination letter was submitted on July 9, 2018 and your concurrence was received on July 18, 2018.

Since submitting the revised effect determination, one design change has been made to the Project. A three-story parking deck proposed to be constructed east of Main Street Station in Richmond has been removed, along with associated roadway modifications. In addition, a third round of consulting party meetings and associated conference calls was held in October 2018 and additional feedback on historic properties and effect were received. All feedback received in meetings, via email, through telephone calls, and as hard-copy letters has been evaluated and thoroughly discussed with the FRA, DRPT, Advisory Council on Historic Preservation (ACHP), and the Virginia Department of Historic Resources (DHR), as well as with the consulting parties.

Dialogues associated with the Project redesigns and extensive feedback have resulted in additional modifications to the list of historic properties and project effect. In sum, two related resources have been evaluated as a potential Traditional Cultural Property (TCP) (Lumpkin's Jail/Devil's Half Acre Site [44HE1053] and "Burial Ground for Negros" [44HE1089]), two archaeological sites have been added to the list of historic properties (Lumpkin's Jail/Devil's Half Acre Site [44HE1053] and Grave Yard for Free People of Color and Slaves [44HE1203]), one resource has been removed from the list of historic properties (site 44HE0357), and one resource has a recommended effect change (Railroad Y.M.C.A. [127-0344-0123]). Additional details on these resources are below. In total, with these changes, the number of historic properties in the APE has increased to 120.

Lumpkin's Jail/Devil's Half Acre site (44HE1053) and "Burial Ground for Negros" (44HE1089)

The Lumpkins Jail/Devil's Half Acre site (44HE1053) is located west of Main Street Station in Shockoe Bottom (Figure 1 and Figure 2). The "Burial Ground for Negros" (44HE1089) is located nearby, north of Broad Street and east of I-95. On July 20, 2018, the National Trust for Historic Preservation (NTHP) submitted a letter to DRPT stating that they believed that the two sites, as well as several to-be-recorded resources, comprised a TCP representing the Richmond slave trade. Since receipt of their letter, FRA and DRPT have held numerous meetings with the DHR, ACHP, and consulting parties to evaluate this area as a potential TCP. They have also conducted extensive research and coordination on TCPs in general, TCPs in Virginia, and the Shockoe area as a TCP in particular, to assure that all avenues have been explored. According to the National Park Service (NPS), a TCP is: "a property that is eligible for inclusion in the National Register based on its associations with the cultural practices, traditions, beliefs, lifeways, arts, crafts, or social institutions of a living community. TCPs are rooted in a traditional community's history and are important in maintaining the continuing cultural identity of the community." Data gathered as part of the TCP review has been discussed with the FRA, DRPT, ACHP, and DHR to solicit their input and ascertain the path forward. Based on this consultation, FRA recommends that the Shockoe area does not meet the definition of a TCP based on the extant information at hand and its interpretation of this type of resource.

Beyond considering this area as a TCP, the NTHP also requested that both Lumpkin's Jail/Devil's Half Acre and Burial Ground for Negros should be included in the APE. The APE was initially coordinated with the DHR in February 2015. The extent was based on the previous Richmond to Raleigh High Speed Rail study and included different APEs for above- and below-ground resources. Based on cultural resource studies, modifications to the project design, and input from consulting parties, the APE has been modified since that time to include resources wherein the Project has the potential to impact character-defining features of a resource. The NTHP stated that the APE is inconsistent with Section 106 regulations and requested that the APE in Shockoe be enlarged to include the Lumpkin's Jail Site (44HE1053) and the Burial Ground for Negros (44HE1089).

Expansion of the APE in this area was discussed extensively with involved agencies and presented to consulting parties on October 12, 2018. Through these dialogues, it is recommended that the APE should be expanded to include the Lumpkin's Jail Site but not the Burial Ground for Negros. Although numerous archaeological studies have been completed to locate the Burial Ground for Negros, no physical evidence of this site has yet to be uncovered. As such, the data potential and significance of this site is unknown, and this site is not included in the APE. Archaeological studies at Lumpkin's Jail/Devil's Half Acre occurred in 2006 and 2008 and features and artifacts representing Richmond's slave trade were uncovered beneath over 10 feet of fill. Although the site has not received a formal eligibility determination from the DHR, based on numerous dialogues and meetings regarding this resource, the FRA and DRPT are including the site in APE and assuming eligibility of this site under Criterion A for its association with the slave trade industry and under Criterion D as an archaeological site for its ability to provide information on area history.

In addition to examining its inclusion in the APE, FRA also evaluated the potential project effect on this historic property. As a resource assumed eligible under Criterion A, the applicable aspects of integrity that render an association with the slave trade are location, design, materials, workmanship, and association. None of these aspects will be altered by the current Project. While the Project may alter the integrity of setting and feeling of the resource due to the widening of one rail platform by approximately 15 feet and increase in train traffic, these two aspects of integrity do not contribute to the overall eligibility of the site as they have been severely impacted over many years by the channeling of Shockoe Creek, construction of I-95, and other large-scale development and re-development in this area (Figure 3 and Figure 4).

Regarding Criterion D, the site is located over 300 feet west of the closest project element, and no subsurface disturbance will occur within or near the site boundaries (see Figure 2). Regardless, FRA and DRPT are committed to completing archaeological monitoring and data recovery in all areas where subsurface construction activities for the Project are required in the vicinity of this site and Main Street Station. Archaeological excavations will be completed prior to construction should artifact-bearing deposits associated with this site, or the slave trade in general, be located in the Project's limits of disturbance. Through this commitment and due to the extant diminished setting and feeling of the resource site, it is recommended that the Project will have no adverse effect on this resource. This recommendation reflects National Park Service Bulletin 36 (p. 19) regarding archaeological sites that are eligible under multiple criteria. Despite this recommendation, the FRA and DRPT recognize the importance of this site and acknowledge the history of this area, specifically as it relates to the slave trade. As such, the site is being considered a contributing element to the surrounding Shockoe Valley and Tobacco Row Historic District (127-0344) as part of this Project, and mitigation to the adverse effects on this district (as determined by your office in June 2018) will include stipulations associated with this significant site and its value as an important piece of Richmond's past.

Grave Yard for Free People of Color and Slaves (site 44HE1203)

The Grave Yard for Free People of Color and Slaves (site 44HE1203) is located north of Hospital Street. The site represents a cemetery established around 1816 and in use until the mid-nineteenth century. The area has been repeatedly modified in the twentieth century, including the construction of a gas station on a portion of the lot. There is no above-ground evidence of the site. Archaeological studies to identify portions of the cemetery were conducted several times by the Virginia Department of Transportation, but no physical evidence was uncovered. Due to its presence on numerous historic maps, though, the resource was recorded as an archaeological site during the DC2RVA Project and determined to be potentially eligible for the NRHP under Criterion D; the site's boundaries were determined based on historic map projections. Although the DHR concurred with DRPT's initial eligibility assessment in a letter dated June 12, 2018 that the portion of the site within the APE does not contribute to the eligibility of this resource, FRA and DRPT have elected to include the overall site within the roster of historic properties based on consulting party comments.

Using available data on the site's boundaries, the project team reworked roadway plans in this area to avoid any portion of the site that may have intact soils (Figure 5). The northern limit of disturbance for modifications to Hospital Street was reduced to parallel the existing street cut—an area that is already disturbed. Through this action, the Project now avoids areas of the site with any likely potential to contain interments or other significant archaeological deposits. It is recommended that the Project will have no adverse effect on this resource.

Site 44HE0357

Site 44HE0357 represents the archaeological remains of a late-eighteenth through nineteenth century privy and backyard complex. The site is located east of Main Street Station in Shockoe Bottom. The original effect determination was predicated on the construction of a parking deck in this area, which would have resulted in adverse effects to significant archaeological deposits. With the removal of the parking deck, this site is no longer in the APE as no construction activities are located within or near the site (see Figure 1 and Figure 2).

Railroad Y.M.C.A. (127-0344-0123)

The Railroad Y.M.C.A. (127-0344-0123) at 1552 East Main Street is a circa 1907 building constructed to provide recreational space for railroad workers and their families in the area. Previous plans for the Project included a multistory parking deck immediately to the rear of this building, which had the potential to diminish its integrity of setting, feeling and association resulting in an adverse effect determination. Due to the removal of the parking deck from project plans, no major project structural elements are in the general viewshed of this resource. Project plans do include addition of new platforms extending outward 15 feet alongside the existing rail viaduct and train shed on both the east and west sides of Main Street Station. These minimal changes will not diminish the characteristics that render this resource eligible for the NRHP (see Figure 2 for limits of disturbance in this area). As such, it is recommended that the Project will now have no adverse effect on this resource.

The remainder of the effect recommendations on individual resources and the Project's overall effect on historic properties presented on June 20, 2018 and July 9, 2018 remain unchanged. The attached table represents a full compendium of all 120 resources and effect determinations.

We invite your agency to concur with these recommendations within 30 days of receipt of this letter. If you have questions about these effect recommendations or cultural resource studies for this Project in general, please do not hesitate to contact Ms. Emily Stock, DRPT Project Manager, at (804) 591-4433 or via email at Emily.stock@drpt.virginia.gov, or me at (540) 899-9170 or via email at kbarile@dovetailcrg.com.

Sincerely,

Kerri S. Barile, Ph.D.
President, Dovetail Cultural Resource Group

Stephen Walter, Parsons

The Virginia SHPO concurs that Lumpkin's Jail/Devil's Half Acre, Burial Ground for Negros, and the surrounding area do not meet the criteria of a Traditional Culural Property. They also concur that Lumpkin's Jail/Devil's Half Acre is within the APE of the DC2RVA Project (DHR #2014-0666) but Burial Ground for Negros is not wihtin the APE. The SHPO additionally concurs that the Preferred Alternative for the DC2RVA project will have no adverse effect on the Lumpkin's Jail/Devil's Half Acre site (44HE1053), Grave Yard for Free People of Color and Slaves (site 44HE1203), and Railroad Y.M.C.A. (127-0344-0123). Site 44HE0357 has been removed from the APE.

The project will continue to have an overall adverse effect on historic properties**.**

N-S Order	DHR ID	Name/Description	City/County	Date / Time Period	Description	NRHP Eligibility	DHR Effect Determination	Image
1	500-0001	Richmond, Fredericksburg, and Potomac Railroad	Arlington County, City of Alexandria, Fairfax County, Prince William County, Stafford County, City of Fredericksburg, Spotsylvania County, Caroline County, Hanover County, Henrico County, City of Richmond	1836-1943	The RF&P opened in 1836 and eventually spanned from the Potomac River to Richmond. The corridor includes the main rail line, spurs, and associated elements such as station houses, bridges, and other structures.	Eligible under Criterion A	Adverse	
2	029-0218	Mount Vernon Memorial Highway (portion of George Washington Memorial Parkway)	Fairfax County, Arlington County	ca. 1929	The Mount Vernon Memorial Highway is an 8 ½-mile section of the George Washington Memorial Parkway from Fairfax County to the southern boundary of Alexandria. The four-lane wide highway was constructed with concrete slab construction and while much of the concrete remains intact.	Listed under Criteria A and C	No Adverse	
3	000-0045	Washington National Airport (Reagan National Airport)	Arlington County	1941	The primary/historic building is a four-story, multi-bay, airline passenger terminal constructed in the Moderne style. Property also includes six c 1941 airplane hangers and associated runways and other landscape elements.	Listed under Criteria A and C	No Adverse	
4	100-0160	George Washington Junior High School, 1005 Mt. Vernon Avenue	City of Alexandria	1935	The resource is a three-story, multi-bay school building constructed in the Art Deco style originally in a rectangular form. The building is constructed of large, cut, grey sandstone and brick laid in an irregular bond.	Potentially Eligible under C (Assuming eligible for undertaking)	No Effect	
5	100-0133	Parker-Gray Historic District/Uptown	City of Alexandria	ca. 1810	The district covers over 45 blocks in the northwestern quadrant of Old Town Alexandria and abuts the Alexandria Historic District. It consists mainly of small row houses and townhomes built in the mid-to-late nineteenth century.	Listed under Criteria A and C	No Adverse	
6	100-0137	Rosemont Historic District	City of Alexandria	ca. 1900	The district is a planned, residential subdivision that is located northwest of Old Town Alexandria. It consists mainly of small, middle-class houses built between 1908 and 1940.	Listed under Criteria A and C	No Adverse	
7	100-0124	Alexandria Depot, 110 Callahan Drive	City of Alexandria	1905	The train depot known as Alexandria Union Station at 110 Callahan Drive is a one-and-one-half-story, multi-bay, passenger depot constructed in the Colonial Revival style	Listed under Criteria A and C	No Adverse	
8	100-0128	George Washington National Masonic Memorial	City of Alexandria	ca. 1922	The resource at 101 Callahan Drive is a nine-story, multi-bay, memorial and museum sitting on a designed knoll constructed in the Classical Revival style.	Listed under Criterion C and Criteria Consideration F	No Effect	
9	100-0277	Phoenix Mill, 3642 Wheeler Avenue	City of Alexandria	ca. 1776	The building is a two-story, three-bay, industrial building. It is purportedly the "sole remaining example of a mill structure in Alexandria."	Eligible under Criteria A and C	No Adverse

10	029-0953	Old Colchester Road, Potomac Path, King's Highway	Fairfax County	ca. 1664	This two-lane asphalt road runs northeast from the Occoquan River for approximately 4 miles to the intersection with Route 1 in Lorton. Old Colchester Road played an important role in the county's early transportation history.	Eligible under Criterion A	No Effect	
11	029-0043	Colchester Arms, Fairfax Arms, 10712 Old Colchester Road	Fairfax County	ca. 1756	The building ais a one-and-a-half story, four-bay tavern constructed with an irregular four-room plan. The timber-framed structural system rests on a continuous, raised-basement, stone foundation.	Listed under Criteria A and C	No Adverse	
12	500-0001-0022	RF&P Bridge over Occoquon River	Prince William County	1915	The resource is a through-truss, camelback railroad bridge constructed close to the middle of the height of this type of structure, 1870-1930. Although once common, few have survived.	Eligible under Criterion C; Contributing to RF&P HD	Adverse	500-0001-0022
13	076-0023	Rippon Lodge	Prince William County	1747	One of the oldest houses in Prince William County, the vista from Rippon Lodge looking down Neabsco Creek (and future site of the railroad) was documented by Benjamin Latrobe.	Listed under Criteria A and B	Adverse	
14	44ST1223	Civil War Campsite	Stafford County	1862-1863	This site represents a Civil War campsite occupied during the winter of 1862–1863 when the Union Army was ordered into winter quarters.	Potentially Eligible under Criteria A and D (Assuming eligible for undertaking)	Adverse	
15	111-0147	Fredericksburg & Spotsylvania Co. Battlefields National Military Park & Cemetery, Lee Drive	City of Fredericksburg	1862	The resource is a Civil War battlefield park composed of earthworks, cannons, and informational markers in addition to a total of 429 non-archaeological cultural resources, 350 of which are considered contributing to its significance.	Listed under Criteria A and D	No Adverse	
16	111-5295	Battle of Fredericksburg I	City of Fredericksburg	1862	The battlefield is the location of a Civil War battle that occurred between December 11 and December 15, 1862. Union Major General Ambrose Burnside and his troops battled General Robert E. Lee's Confederate men, resulting in a Confederate victory. The battlefield continues to retain a high level of integrity.	Eligible/Potentially Eligible under Criterion A	No Adverse	
17	111-5296	Battle of Fredericksburg II	City of Fredericksburg	1863	The Battlefield is a 12,694.2-acre battlefield associated with a Civil War battle of the same name, which took place on May 3, 1863. Despite expansive residential, commercial, and industrial development around the battlefield and the Fredericksburg, it continues to retain a high level of integrity	Eligible/Potentially Eligible under Criterion A	No Adverse	
18	111-0132-0025	Rappahannock River Railroad Bridge and Associated Structures/Platform	City of Fredericksburg	1927	This multiple-span, open-spandrel, concrete-arch bridge is an excellent and rare surviving example of a reinforced-concrete arch railroad bridge within this region of Virginia. It was erected when the station and tracks were elevated for automobile traffic pass through in downtown Fredericksburg.	Eligible under Criterion C; Contributing to Fredericksburg HD and RF&P HD	Adverse	111-0132-0025

28	111-0132-0020	Purina Tower	City of Fredericksburg	1916	The resource is a one-and-one-half story commercial building with a tall grain elevator at the northwest corner. The tower has become an important landscape landmark within the community.	Eligible under Criteria A and C; Contributing to Fredericksburg HD	No Adverse	111-0132-0020
29	111-0132-0522	House, 314–316 Frederick Street	City of Fredericksburg	1851	This is a two-story, four-bay vernacular brick duplex. Oral history states that the building was used as a slave jail in the antebellum period.	Eligible under Criteria A and B; Contributing to Fredericksburg HD	No Adverse	111-0132-0522
30	111-0009-0795	Pulliam's Service Station, 411 Lafayette Boulevard	City of Fredericksburg	ca. 1937	This resource is a one-story filling station constructed in the Spanish Revival style. It still retains its original materials and configuration.	Eligible under Criteria A and C; Contributing to Fredericksburg HD	No Adverse	111-0009-0795
31	111-0009	Fredericksburg Historic District Extension	City of Fredericksburg	1794-1967	The district extension is a large area that includes a wide variety of resources immediately surrounding the city's downtown core including residences, commercial buildings, and churches dating to the 19th and 20th c.	Eligible under Criteria A and C	No Adverse	
32	088-5181	Salem Church Battlefield (Banks Ford Battlefield)	Spotsylvania County, City of Fredericksburg	1863	The battlefield includes the land where Hay's and Hoke's brigades attacked the Union Sixth Corps in 1863. It includes Confederate earthworks, Salem Church, and the path of the Plank Road.	Eligible under Criterion A	No Adverse	
33	088-5364	Virginia Central Railway Historic District	City of Fredericksburg, Spotsylvania County, and more	1853	The district is a 38-mile-long railroad corridor that extends west from the CSX railroad (formerly the RF&P) in Fredericksburg to the town of Orange encompassing rail-related structures, sites, and landscape features. The 3.5-mile long eastern section is eligible.	Eligible under Criterion A	No Adverse	
34	111-0145	Fredericksburg Gun Manufactory	City of Fredericksburg	ca. 1775	The Fredericksburg Gun Manufactory is an archaeological site that is at least 75 percent intact. The remains of the manufacturing facility are located beneath a paved asphalt parking lot for a public school.	Listed under Criteria A and D	No Adverse	
35	088-0254	Slaughter Pen Farm, 11232 Tidewater Trail (Wayside Farm or Pierson Farm)	Spotsylvania County	ca. 1861	Slaughter Pen Farm, also known as Wayside Farm or Pierson Farm, is a 19th century farm complex composed of a two-story, three-bay, Italianate-style, single-family dwelling, three agricultural outbuildings, a shed, one kitchen, a slave quarters, and a well.	Eligible under Criterion A	No Adverse	
36	44SP0468	Earthwork/ Jackson's Earthwork	Spotsylvania County	1861	This resource includes a set of earthworks within a larger archaeological site. The area is almost totally enclosed by lines of military shelter trenches constructed prior to or following the First Battle of Fredericksburg.	Potentially Eligible under Criteria A, C and D (Assuming eligible for undertaking)	Adverse	

N-S Order	DHR ID	Name/Description	City/County	Date / Time Period	Description	NRHP Eligibility	DHR Effect Determination	Image
37	088-0039	La Vue, 3232 LaVue Lane (Prospect View)	Spotsylvania County	ca. 1848	La Vue, also known as Prospect View, is a two-story, three-bay, single-family dwelling constructed in the Greek Revival style with an L-plan.	Listed under Criterion C	No Adverse	
38	016-0092	Fairfield Plantation Office, Jackson Shrine, 12019 Stonewall Jackson Road	Caroline County	1828	The resource is a one-and-a-half-story frame building; it once served as the office for the 740-acre Fairfield Plantation and is the only surviving building. On May 10, 1863, Confederate General Thomas Jonathan "Stonewall" Jackson died at the site after being wounded at the Battle of Chancellorsville.	Eligible under Criteria A and C	No Adverse	
39	016-0208	House, 12096 Guinea Drive	Caroline County	ca. 1900	The resource is a is a one-and-a-half-story vernacular dwelling with Queen Anne and Craftsman elements. The house was built from a kit purchased from the Sears & Roebuck Company.	Potentially Eligible under Criterion C (Assuming eligible for undertaking)	No Effect	
40	016-5165	Excelsior Industry of Caroline County MPD	Caroline County	ca. 1925-1960	This is a thematic collection of resources that are associated with the manufacture of excelsior, Caroline County's largest industry in the early twentieth century	Eligible under Criteria A and C	No Adverse	
41	016-0223	First Woodford Post Office	Caroline County	1874	This small frame office building is located immediately adjacent to the railroad and is associated with the Woodford Excelsior Company, Caroline County's first excelsior manufacturer. It was the focal point of the operation.	Eligible under Criteria A and C	No Adverse	
42	016-0222	Woodford Freight & Passenger Depot, Woodford Road	Caroline County	ca. 1900	The resource is a long, rectangular, one-story, framed building constructed circa 1900. The building served a combined function as both a freight depot and a passenger depot and was one of five original stops along the RF&P in Caroline County.	Eligible under Criteria A and C; Contributing to RF&P HD	No Adverse	
43	016-0220	Carolina Mansion, 11146 Woodford Road	Caroline County	ca. 1900	The ornate, two-and-a-half-story, wood framed dwelling was designed in the Queen Anne style with Classical detailing. The building represents housing constructed in the area in the early-twentieth century, when the RF&P and new manufacturing enterprises brought economic prosperity to the local region.	Potentially Eligible under Criterion C (Assuming eligible for undertaking)	No Effect	
44	016-5136	Milford Historic District	Caroline County	ca. 1880–1960	The district was originally established in the late-eighteenth century as a tobacco trading center. In 1836, the RF&P Railroad was constructed through the area and Milford soon became the largest of the small communities in the county situated along the railroad.	Eligible under Criteria A and C	No Adverse	
45	016-0270	Milford State Bank, 15461 Antioch Road	Caroline County	ca. 1910	The bank is a two-story brick building constructed in the Classical Revival style. The building's façade is divided into five distinct bays via brick pilasters. It is the only Classical Revival building as well as the only bank in the village of Milford.	Potentially Eligible under Criterion C (Assuming eligible for undertaking)	No Adverse

Potentially Eligible under Criterion D (Assuming eligible for undertaking)	Adverse	
96	127-6793	Chesapeake & Ohio (C&O) Railroad Segment	City of Richmond	pre-1851	The C&O Railroad that is primarily made up of two parallel steel tracks that is notable for its role in Richmond's transportation history.	Eligible under Criterion A	No Adverse	
97	127-0171	James River and Kanawha Canal Historic District	City of Richmond	1795	Circa 1785, canal improved navigation on the James River from Richmond to Botetourt County a distance of approximately 200 miles; District comprises of the canal and canal towpath.	Listed under Criteria A and C	No Adverse	
98	127-5809	Bridge #1857, North 14th Street; Mayo Bridge North	City of Richmond	1911	The Mayo Bridge is a closed spandrel reinforced concrete arch bridge. consists of two segments (127-5808, south segment, and 127-5809, north segment) extending between the north and south banks of the James River and separated in the middle by Mayo Island.	Potentially Eligible under Criteria A and C (Assuming eligible for undertaking)	No Adverse	
99	127-6792	Southern Railway	City of Richmond	ca. 1850	A railroad corridor that dates to the mid-nineteenth century and was key in Richmond's development for over a century	Eligible under Criterion A	No Adverse	

N-S Order	DHR ID	Name/Description	City/County	Date / Time Period	Description	NRHP Eligibility	DHR Effect Determination	Image
100	127-0457	Manchester Warehouse Historic District	City of Richmond	1880-1960	The district comprises 42 blocks of industrial development associated with the growth and development of the community of Manchester, an area south of the James River that was once a separate town but later incorporated within the City of Richmond.	Listed under Criteria A and C	No Adverse	
101	127-6193	J.P. Taylor Leaf Tobacco, Southern Stove Works, 516 Dinwiddie Ave	City of Richmond	1920	This resource mirrors other early-20th century factories in the area: all brick construction, with regularly spaced and relatively large windows, and sections of light monitor on the pitched roof apex for allowing natural light for the workers. It was used as a stove factory and then for tobacco processing.	Listed under Criteria A and C	No Adverse	
102	127-6245	Williams Bridge Company, Emergency Fleet Corporation Factory, 700 East 4th Street	City of Richmond	1919	Built in 1919 to assist with World War I war efforts; also used by the US government during World War II; eligible boundary contains main factory and apartment structures used to house workers during both world wars .	Eligible under Criteria A, C, and D	No Adverse	127-6245 WILLIAMS BRIDGE COMPANY
103	127-6248	Pure Oil Company, 1314 Commerce Street, Transmontaigne	City of Richmond	1936	This property has been used to refine, store, ship, and process oil extracts for almost 80 years; founded in 1928 as Gulf Refinery Company; associated with the history of oil production and transport in Richmond	Eligible under Criteria A and C	No Adverse	
104	127-6213	Davee Gardens Historic District	City of Richmond	1947	This district is a planned, symmetrical suburb of Richmond, established in 1947. Homes in the neighborhood retain a high degree of historic integrity, and the street plan is emblematic of post World War II design.	Eligible under Criteria A and C	No Adverse	
105	127-5818	Philip Morris Operations Complex, 3601 Commerce Road	City of Richmond	1959–1974	This is a mid-twentieth-century, light-industrial complex that serves as headquarters for the company’s tobacco production. They are unique industrial-related building constructed in the post-modern Neoexpressionist and Brutalist styles.	Eligible under Criteria A and C and Criteria Consideration G	No Adverse	
106	020-5474	DuPont Spruance	Chesterfield County	1929	The first of several buildings on the DuPont Spruance Plant was constructed under the ownership DuPont Rayon Co. This large factory has played a significant role in the development of textiles and plastics in the United States.	Eligible under Criteria A and C	No Effect	
107	043-0307	Battle of Chaffin's Farm (New Market Heights Battlefield), New Market Road	Chesterfield County, Henrico County, City of Richmond	1862	The Battle of New Market Heights is nationally significant because of the all-important role played by Black soldiers in this fight and the recognition of their gallantry by the United States government through the award of 14 Medals of Honor to participants.	Eligible under Criterion A	No Adverse	
108	020-0063	Falling Creek Ironworks Archaeological Site	Chesterfield County	1619	The Falling Creek Ironwork archaeological site was originally recorded as the location of the Virginia Company Ironworks. Subsequent investigation suggests that it could also be Cary's Ironworks, destroyed in 1781 during the American Revolution.	Listed under Criterion D	No Adverse	

N-S Order	DHR ID	Name/Description	City/County	Date / Time Period	Description	NRHP Eligibility	DHR Effect Determination	Image
109	020-5320	Proctor's Creek Battlefield	Chesterfield County, Colonial Heights	1864	Currently the battlefield consists of monuments, interpretive markers (state and freeman markers/park service interpretation at Fort Darling unit/county interpretation at Fort Stephens), a cemetery, historic road beds, period structures (Wooldridge, Willis, Halfway houses), and trenches/field fortifications.	Eligible/Potentially Eligible under Criterion A	No Adverse	020-5320 S 11 PROCTOR'S CREEK FIGHT
110	020-0147	Drewry's Bluff Battlefield (Fort Darling, Fort Drewry), Fort Darling Road	Chesterfield County, Henrico County	1862	Drewry's Bluff encompasses 42.4 acres of land. The CCC camp based at Fort Harrison rehabilitated the site in 1935, clearing brush and trees and stabilizing the earthworks.	Eligible under Criterion A	No Adverse	
111	123-5025	Assault on Petersburg (Petersburg Battlefield II), Bermuda Hundred Road (Alt Route 697)	Charles City County, Chesterfield County, City of Colonial Heights, City of Hopewell, City of Petersburg, Prince George County	1865	This resource includes a Civil War battlefield that represents part of the Richmond Petersburg campaign in and around Petersburg. Today, the battlefield consists of earthworks, roadways, and other features as well as interpretive materials.	Eligible under Criterion A	No Adverse	
112	020-5336	The Bellwood-Richmond Quartermaster Depot Historic District, US Department of Defense Supply Center Historic District	Chesterfield County	post-1942	The district is a group of residential, industrial, and military buildings dating from the construction Sheffield/Bellwood Manor (020-0007), circa 1804, to the development of the Korean Conflict era buildings in 1952	Eligible under Criteria A, B, C, D	No Adverse	
113	020-0007	Bellwood, Sheffields, Auburn Chase, Building 42, Defense Supply Center Richmond, 8000 Jefferson Davis Hwy	Chesterfield County	1804	This resource is significant as a representative of an early-nineteenth century antebellum plantation that has evolved into a modern, twentieth-century farm and dairying operation. The main house is an excellent example of vernacular interpretation of the Early Classical Revival style in the piedmont area constructed in an I-form. Numerous archaeological resources are located on the parcel.	Listed under Criteria A, C, and D	No Adverse	
114	44CF0680 / 020-0022	Fort Darling/Battlefield, Earthworks, Fort/ Centralia Earthworks	Chesterfield County	1861-1865	The earthworks were developed by Confederate troops as part of the Outer Line of defenses for Drewry's Bluff. Although some segments of the earthworks has been destroyed, the extant areas remain in excellent condition and the remaining elements of the artillery battery, trenches, and gun emplacements are representative of earthworks developed in this area during the Civil War.	Eligible under Criteria A, C, and D	No Adverse	
115	020-5351	Richmond & Petersburg Electric Railway	Chesterfield County	1902	This resource contains the alignment of the regional trolley system. Creation of this line was the direct impetus for large-scale modifications to settlement patterns in central Virginia.	Eligible under Criterion A	No Adverse	
116	020-0013	House, 3619 Thurston Road	Chesterfield County	1913	This resource is a 1.5-story Colonial Revival dwelling with a gambrel roof and flared eaves. It retains a high degree of architectural integrity.	Eligible under Criterion C	No Effect	
117	127-6251	Atlantic Coast Line Railroad Corridor, Richmond and Petersburg Railroad	City of Richmond, Chesterfield County	post 1833	Historic railroad corridor that represents the origins and growth of the railroad industry in the Richmond to Petersburg corridor; reflects the post-Civil War trend of merging smaller operations to provide better service while being more economical	Eligible under Criterion A	No Adverse	

N-S Order	DHR ID	Name/Description	City/County	Date / Time Period	Description	NRHP Eligibility	DHR Effect Determination	Image
118	020-5378	VEPCo Power Transmission Line	Chesterfield County	ca. 1910	The VEPCo Line was built The line was built sometime between 1910 and 1930, likely between 1925 and 1927, providing high-voltage electric power service to the people in the area. It is approximately one mile long, and it is the only remaining portion of the line that once extended from Richmond to Petersburg.	Eligible under Criteria A and C	No Effect	119	020-0140	Circle Oaks/4510 Centralia Road	Chesterfield County	1840	This resource is a two-story, wood frame single-family dwelling featuring a two-story, wrap around veranda. Property includes a small tenant house (perhaps servant’s quarters) and a kitchen. Circle Oaks is the oldest and largest building in the community.	Eligible under Criterion C	No Adverse	120	020-0552	Centralia Post Office	Chesterfield County	1905	The one-story building was the center of the community of Centralia. It was constructed to face east onto the rail tracks to accommodate rail travelers through this area during the economic boom of the pre-World War I days.	Eligible under Criterion A	No Adverse	
The Virginia SHPO concurs that Lumpkin's Jail/Devil's Half Acre, Burial Ground for Negros, and the surrounding area do not meet the criteria of a Traditional Culural Property. They also concur that Lumpkin's Jail/Devil's Half Acre is within the APE of the DC2RVA Project (DHR #2014-0666) but Burial Ground for Negros is not wihtin the APE. The SHPO additionally concurs that the Preferred Alternative for the DC2RVA project will have no adverse effect on the Lumpkin's Jail/Devil's Half Acre site (44HE1053), Grave Yard for Free People of Color and Slaves (site 44HE1203), and Railroad Y.M.C.A. (127-0344-0123). Site 44HE0357 has been removed from the APE.

The project will continue to have an overall adverse effect on historic properties.

Dear DC2RVA MOA signatories,

Thank you so very much for your continued feedback and thoughts as we work through the complex 106 process for the DC to Richmond Southeast High Speed Rail project! Over the past four years, and particularly over the past six months, we have garnered an incredible amount of data on this corridor including significant public and consulting party feedback. I've attached a revised MOA (both a Track Changes copy and a Clean copy as sometimes the track changes copy gets a bit dizzying) to this document that is inclusive of all of the feedback received to date, including:

- Edits to the first draft from the Virginia AG's office received in September 2018
- Edits to the first draft from the FRA received in November 2018
- Edits made based on DHR review and updated effect determinations
- Edits made by DRPT and team to address comments received during the scores of communications with consulting parties and the public regarding cultural resources along the corridor
- Additional edits and thoughts as received from DRPT, FRA, ACHP, DHR, and others throughout the process

In addition to the revised MOA, I've also attached an excel sheet that outlines all of the actual mitigation stipulation changes that have occurred since the original draft. This shows what modifications were made based on consulting party feedback to address their requests and concerns....and to have all mitigation in one spot as scrolling through so many pages is daunting!

Lastly, just a quick note that I reduced the quality of the maps so that the documents can be easily emailed. I will replace them with full-quality versions when the document goes final.

Again, thank you again for your help and please let me, Emily Stock, or any other team member know if we can address any questions. I will be sending this MOA in clean format to consulting parties for their concurrent review likely next week to assure that all comments are received and considered prior to ratifying the document.

I hope you all have a wonderful holiday!
Kerri

DHR has used similar language in other agreement documents to indicate that it's not the federal agency itself doing the work, but a consultant hired by the federal agency.

> Hi Sarah,
>
> Thank you again for your edits to the MOA. I'm making them now. I just had one quick question. As you alluded to in your sidebar comments, DRPT will be using a consultant to do the mitigation commitments but they aren't sure who they will be using. That's why the DHR suggested the "or cause to be created" language. Would it be acceptable to you (and the other signatories) if we amend this line by saying "or cause to be created through the engagement of a qualified consultant"? Or is there other verbiage you would suggest to convey this thought?

APPENDIX E5

CONSULTING PARTY AND PUBLIC INVITATIONS, EMAILS, LETTERS, AND OTHER CORRESPONDENCE

D.C. TO RICHMOND SOUTHEAST HIGH SPEED RAIL

U.S. Department
of Transportation
**Federal Railroad
Administration**

1200 New Jersey Ave. SE
Washington, DC 20590

FEB 1 3 2018

Chief Anne Richardson
Rappahannock Indian Tribe
5036 Indian Neck Road
Indian Neck, VA 23148

RE: Invitation for Consulting Party Status/Southeast High Speed Rail Tier II Environmental Impact Statement, Washington, DC to Richmond Segment (DC2RVA)

Dear Chief Richardson,

The Federal Railroad Administration (FRA) and the Virginia Department of Rail and Public Transportation (DRPT) are conducting environmental studies associated with the Tier II Environmental Impact Statement (EIS) for the Washington, DC to Richmond segment of the Southeast High Speed Rail corridor (Project). The Project spans 123 miles along an existing rail corridor owned by CSX Transportation (CSXT), from Control Point RO (Mile Post (MP) CFP-110) in Arlington south to the CSXT A-Line/CSXT-S-Line junction at MP A-11 in Centralia, Virginia (Chesterfield County) – see attached corridor map. The Tier II EIS will involve further analysis of the route alignments and improvement concepts progressed through the 2002 Tier I EIS and Record of Decision (ROD) covering the Southeast High Speed Rail (SEHSR) corridor between Charlotte, NC and Washington, D.C. Additional information on the Tier II EIS may be found at the project website (www.DC2RVArail.com).

This Tier II EIS is receiving federal funding through the FRA, which is the lead Federal agency for the EIS, and if constructed, the Project will require permits issued by other federal agencies such as the U.S. Army Corps of Engineers, and will traverse federal land including parcels owned by the U.S. Marine Corps and the National Park Service, among others. Due to the federal agency approvals and funding, the undertaking requires compliance with the National Environmental Policy Act (NEPA) and Section 106 of the National Historic Preservation Act (NHPA), as amended. FRA and DRPT have completed initial cultural resources surveys, including defining the Project's limits of disturbance, and are preparing to start a second round of surveys.

In accordance with regulations implementing Section 106 of the NHPA, we are identifying "consulting parties" with whom to coordinate the evaluation of historic properties, potential Project effects on such properties, and possible means of avoiding or mitigating adverse effects on such properties. Because the Rappahannock Tribe is now a federally recognized tribe and potentially has an interest in historic property issues in the general Project area, we would like to extend to you the opportunity to participate in the Project studies as a consulting party. If you or your organization would like to participate as such, including the opportunity to review the any cultural resource documents, please provide a written request to this effect directed to me.

The Project has been ongoing for a little over three years. On October 23, 2014, FRA published in the Federal Register a Notice of Intent to prepare the EIS. On September 8, 2017, FRA published the Draft EIS. The public comment period for the Draft EIS recently closed and FRA and DRPT are preparing the Final EIS. In addition, we have already had one round of consulting party meetings, but are planning another round later this year. If the Rappahannock Tribe would like to participate in the Project as a consulting party, FRA will ensure that you have sufficient opportunities to do so, including, if you'd prefer, in person government-to-government meetings with FRA or additional in-person meetings with FRA and DRPT.

We would appreciate hearing back from you within 30 days of receipt of this letter. If you have any questions on the role of the consulting parties specifically or the cultural resources surveys that are being conducted as part of the Section 106 process, please feel free to contact John Winkle of my staff at 202.493.6067or john.winkle@dot.gov.

Thank you in advance for your interest and participation in this project.

Sincerely,

Michael Johnsen

RE: Invitation for Consulting Party Status/Southeast High Speed Rail Tier II Environmental Impact Statement, Washington, DC to Richmond Segment (DC2RVA)

Dear Chief Adkins,

The Federal Railroad Administration (FRA) and the Virginia Department of Rail and Public Transportation (DRPT) are conducting environmental studies associated with the Tier II Environmental Impact Statement (EIS) for the Washington, DC to Richmond segment of the Southeast High Speed Rail corridor (Project). The Project spans 123 miles along an existing rail corridor owned by CSX Transportation (CSXT), from Control Point RO (Mile Post (MP) CFP-110) in Arlington south to the CSXT A-Line/CSXT-S-Line junction at MP A-11 in Centralia, Virginia (Chesterfield County) – see attached corridor map. The Tier II EIS will involve further analysis of the route alignments and improvement concepts progressed through the 2002 Tier I EIS and Record of Decision (ROD) covering the Southeast High Speed Rail (SEHSR) corridor between Charlotte, NC and Washington, D.C. Additional information on the Tier II EIS may be found at the project website (www.DC2RVArail.com).

This Tier II EIS is receiving federal funding through the FRA, which is the lead Federal agency for the EIS, and if constructed, the Project will require permits issued by other federal agencies such as the U.S. Army Corps of Engineers, and will traverse federal land including parcels owned by the U.S. Marine Corps and the National Park Service, among others. Due to the federal agency approvals and funding, the undertaking requires compliance with the National Environmental Policy Act (NEPA) and Section 106 of the National Historic Preservation Act (NHPA), as amended. FRA and DRPT have completed initial cultural resources surveys, including defining the Project's limits of disturbance, and are preparing to start a second round of surveys.

In accordance with regulations implementing Section 106 of the NHPA, we are identifying "consulting parties" with whom to coordinate the evaluation of historic properties, potential Project effects on such properties, and possible means of avoiding or mitigating adverse effects on such properties. Because the Chickahominy Tribe is now a federally recognized tribe and potentially has an interest in historic property issues in the general Project area, we would like to extend to you the opportunity to participate in the Project studies as a consulting party. If you or your organization would like to participate as such, including the opportunity to review the any cultural resource documents, please provide a written request to this effect directed to me.

The Project has been ongoing for a little over three years. On October 23, 2014, FRA published in the Federal Register a Notice of Intent to prepare the EIS. On September 8, 2017, FRA published the Draft EIS. The public comment period for the Draft EIS recently closed and FRA and DRPT are preparing the Final EIS. In addition, we have already had one round of consulting party meetings, but are planning another round later this year. If the Chickahominy Tribe would like to participate in the Project as a consulting party, FRA will ensure that you have sufficient opportunities to do so, including, if you'd prefer, in person government-to-government meetings with FRA or additional in-person meetings with FRA and DRPT.

We would appreciate hearing back from you within 30 days of receipt of this letter. If you have any questions on the role of the consulting parties specifically or the cultural resources surveys that are being conducted as part of the Section 106 process, please feel free to contact John Winkle of my staff at 202.493.6067or john.winkle@dot.gov.

Thank you in advance for your interest and participation in this project.

Sincerely,

Michael Johnsen

RE: Invitation for Consulting Party Status/Southeast High Speed Rail Tier II Environmental Impact Statement, Washington, DC to Richmond Segment (DC2RVA)

Dear Chief Adkins,

The Federal Railroad Administration (FRA) and the Virginia Department of Rail and Public Transportation (DRPT) are conducting environmental studies associated with the Tier II Environmental Impact Statement (EIS) for the Washington, DC to Richmond segment of the Southeast High Speed Rail corridor (Project). The Project spans 123 miles along an existing rail corridor owned by CSX Transportation (CSXT), from Control Point RO (Mile Post (MP) CFP-110) in Arlington south to the CSXT A-Line/CSXT-S-Line junction at MP A-11 in Centralia, Virginia (Chesterfield County) – see attached corridor map. The Tier II EIS will involve further analysis of the route alignments and improvement concepts progressed through the 2002 Tier I EIS and Record of Decision (ROD) covering the Southeast High Speed Rail (SEHSR) corridor between Charlotte, NC and Washington, D.C. Additional information on the Tier II EIS may be found at the project website (www.DC2RVArail.com).

This Tier II EIS is receiving federal funding through the FRA, which is the lead Federal agency for the EIS, and if constructed, the Project will require permits issued by other federal agencies such as the U.S. Army Corps of Engineers, and will traverse federal land including parcels owned by the U.S. Marine Corps and the National Park Service, among others. Due to the federal agency approvals and funding, the undertaking requires compliance with the National Environmental Policy Act (NEPA) and Section 106 of the National Historic Preservation Act (NHPA), as amended. FRA and DRPT have completed initial cultural resources surveys, including defining the Project's limits of disturbance, and are preparing to start a second round of surveys.

In accordance with regulations implementing Section 106 of the NHPA, we are identifying "consulting parties" with whom to coordinate the evaluation of historic properties, potential Project effects on such properties, and possible means of avoiding or mitigating adverse effects on such properties. Because the Eastern Chickahominy Tribe is now a federally recognized tribe and potentially has an interest in historic property issues in the general Project area, we would like to extend to you the opportunity to participate in the Project studies as a consulting party. If you or your organization would like to participate as such, including the opportunity to review the any cultural resource documents, please provide a written request to this effect directed to me.

The Project has been ongoing for a little over three years. On October 23, 2014, FRA published in the Federal Register a Notice of Intent to prepare the EIS. On September 8, 2017, FRA published the Draft EIS. The public comment period for the Draft EIS recently closed and FRA and DRPT are preparing the Final EIS. In addition, we have already had one round of consulting party meetings, but are planning another round later this year. If the Eastern Chickahominy Tribe would like to participate in the Project as a consulting party, FRA will ensure that you have sufficient opportunities to do so, including, if you'd prefer, in person government-to-government meetings with FRA or additional in-person meetings with FRA and DRPT.

We would appreciate hearing back from you within 30 days of receipt of this letter. If you have any questions on the role of the consulting parties specifically or the cultural resources surveys that are being conducted as part of the Section 106 process, please feel free to contact John Winkle of my staff at 202.493.6067or john.winkle@dot.gov.

Thank you in advance for your interest and participation in this project.

Sincerely,

Michael Johnsen

Chief Bob Gray
Pamunkey Indian Tribe
331 Pocket Road
Pamunkey Reservation
King William, VA 23086

RE: Invitation to Attend Section 106 Consulting Party Meetings
Southeast High Speed Rail Corridor
Tier II Environmental Impact Statement, Washington, DC to Richmond Segment

Dear Chief Gray,

The Federal Railroad Administration (FRA) and the Virginia Department of Rail and Public Transportation (DRPT) are continuing to conduct environmental studies associated with the Tier II Environmental Impact Statement (EIS) for the Washington, DC to Richmond segment of the Southeast High Speed Rail corridor (DC2RVA project). The DC2RVA project spans 123 miles along an existing rail corridor owned by CSX Transportation (CSXT), from Control Point RO (MP CFP-110) in Arlington south to the CSXT A-Line/CSXT-S-Line junction at MP A-11 in Centralia, Virginia (Chesterfield County). A Draft Environmental Impact Statement (DEIS) was published in September 2017. A copy of this document along with additional information on the project in general may be found at the project website (www.DC2RVArail.com) .

As part of ensuring the project is compliant with Section 106 of the National Historic Preservation Act (Section 106), FRA invited the Pamunkey Tribe to be a consulting party in the Section 106 process. All technical reports produced to date were sent to you in April 2017, and the project team has distributed details associated with the Draft EIS to you via email. As noted above, the full Draft EIS is available on the project website, and we can also send you a digital copy upon request.

The project team is holding in-person meetings with the Section 106 consulting parties to discuss the DC2RVA project and answer any questions they may have on the EIS process. We invite you to participate in one or more of the following upcoming meetings:

October 20, 2017; 1:00pm Lloyd House
220 N Washington Street, Alexandria, VA 22314

October 24, 2017; 10:00am Parsons Transportation Group
100 M Street SE, Suite 1200, Washington, DC 20003

October 27, 2017; 10:00am Fredericksburg City Hall/Second Floor
715 Princess Anne Street, 22401

October 30, 2017; 10:00am DC2RVA Office
801 East Main Street, Suite 1000, Richmond, VA 23219

If you would prefer to meet in person with just FRA and DRPT, please respond accordingly and we will schedule a meeting. Please note that, if acceptable to you, such a meeting may also include representatives from the Catawba Tribe. Although the Catawba Tribe is not Federally recognized in Virginia, it has expressed a general interest in projects along the I-95 corridor and were invited to participate in this project as a consulting party.

If you have any questions regarding the meetings, the project, or the role of the Section 106 consulting parties, or if you'd like to request a meeting with just FRA and DRPT, please contact John Winkle, FRA Environmental Protection Specialist, at 202-493-6067 or john.winkle@dot.gov.

Thank you in advance for your interest and participation in this project.

Hello consulting parties!

The DC2RVA team wanted to send you a quick update on a few items: the project DEIS, additional technical studies, and upcoming meetings.

As some of you have heard, the Draft Environmental Impact Statement (DEIS) for the DC to Richmond segment of the Southeast High Speed Rail project was released on September 8, 2017. This document includes a summary of technical studies to date along the project corridor as well as project purpose and need and recommendation on a preferred alternative. The document is over 900 pages long with thousands of pages of appended technical studies, project correspondence, and more- just a little light reading! We wanted to make you all aware that this document has been published if you are interested in taking a look. The draft EIS can be found here: http://dc2rvarail.com/draft/

We also wanted to touch base to give you a brief summary of the cultural resource studies associated with the project. As you know, Phase I (identification)-level studies have been ongoing for the past two years. Copies of these reports and associated documents were sent to you earlier this year. Dovetail and the rest of the DC2RVA team are continuing to complete Phase I studies on areas that were recently added to the project area based on the selection of a preferred alternative (areas such as road improvements, etc). This work will be ongoing for the next three to six months. In addition, the team is completing Phase II (evaluation)-level studies on numerous above-ground resources to determine their National Register of Historic Places eligibility. This includes archival research, additional fieldwork, and producing more reports. As with the original suite of Phase I reports, all documents resulting from this new set of work will be sent to you all for review and comment as they are completed. All work is also being coordinated with the DHR and other cooperating agencies.

In addition to more technical studies, the DC2RVA team will also be reaching out to you all (if we have not already) to set up a meeting to go over the project in general, talk about the cultural resource studies, and discuss any concerns you may have. Emails and phone calls will be coming your way in the next few days to begin to set these meetings up.

In the meantime, if you have any questions on the DEIS or the ongoing technical studies, please let us know. We're happy to help!
Best,
Kerri

Hello Ashland/Hanover folks!

Thank you so much for your continued feedback on the studies associated with the DC to Richmond Segment of the Southeast High Speed Rail. As I mentioned in my email a few weeks ago, we are reaching out to our consulting parties to see if we can arrange for a meeting to chat about the project and answer any questions you may have. We wanted to see if by chance you all are free at 1pm on October 11th? That is the date of our public hearing in Ashland so we thought maybe we can provide additional details prior to that event and then we would be in Ashland for the hearing that evening. Nora has graciously agreed to let us meet in Ashland Town Hall.

Additional details will be shared once we set a date.

Thank you!
Kerri

Hello ABPP and Civil War Trust folks!

Thank you so much for your continued feedback on the studies associated with the DC to Richmond Segment of the Southeast High Speed Rail. As I mentioned in my email a few weeks ago, we are reaching out to our consulting parties to see if we can arrange for a meeting to chat about the project and answer any questions you may have. We'd like to meet with you both in DC at the Parsons office (100 M Street SE) so we can show images, maps, etc, as needed. Would you be free to meet with us at 10:00 am on one of the following dates:

October 23
October 24
October 25

Additional details will be shared once we set a date.

Thank you!
Kerri

Hi all,

In addition to setting up individual consulting party meetings, I wanted to make sure you are all aware of the upcoming public hearings for the DC2RVA project. There are two this week and three next week. See this link for additional details: http://dc2rvarail.com/indexphpcid162/

If you need any additional details, just let me know.

Thanks!
Kerri and team

On Tue, Sep 19, 2017 at 9:10 AM, Kerri Barile <kbarile@dovetailcrg.com> wrote:

> Hello consulting parties!
>
> The DC2RVA team wanted to send you a quick update on a few items: the project DEIS, additional technical studies, and upcoming meetings.
>
> As some of you have heard, the Draft Environmental Impact Statement (DEIS) for the DC to Richmond segment of the Southeast High Speed Rail project was released on September 8, 2017. This document includes a summary of technical studies to date along the project corridor as well as project purpose and need and recommendation on a preferred alternative. The document is over 900 pages long with thousands of pages of appended technical studies, project correspondence, and more- just a little light reading! We wanted to make you all aware that this document has been published if you are interested in taking a look. The draft EIS can be found here: http://dc2rvarail.com/draft/
>
> We also wanted to touch base to give you a brief summary of the cultural resource studies associated with the project. As you know, Phase I (identification)-level studies have been ongoing for the past two years. Copies of these reports and associated documents were sent to you earlier this year. Dovetail and the rest of the DC2RVA team are continuing to complete Phase I studies on areas that were recently added to the project area based on the selection of a preferred alternative (areas such as road improvements, etc). This work will be ongoing for the next three to six months. In addition, the team is completing Phase II (evaluation)-level studies on numerous above-ground resources to determine their National Register of Historic Places eligibility. This includes archival research, additional fieldwork, and producing more reports. As with the original suite of Phase I reports, all documents resulting from this new set of work will be sent to you all for review and comment as they are completed. All work is also being coordinated with the DHR and other cooperating agencies.
>
> In addition to more technical studies, the DC2RVA team will also be reaching out to you all (if we have not already) to set up a meeting to go over the project in general, talk about the cultural resource studies, and discuss any concerns you may have. Emails and phone calls will be coming your way in the next few days to begin to set these meetings up.
>
> In the meantime, if you have any questions on the DEIS or the ongoing technical studies, please let us know. We're happy to help!

Hello Consulting Parties,

Hope 2018 is treating you well so far!

We wanted to provide everyone with a brief update on the DC2RVA project and cultural resource studies. As you know, technical studies associated with the project commenced in 2015. The results of the first round of work were coordinated with the Virginia Department of Historic Resources (DHR) and culled together in the project Draft Environmental Impact Statement (DEIS), along with all comments that you all had submitted on the project. A link to this document was disseminated in the fall of 2017.

Since that time, the project team has continued to refine the engineering, thus reducing the limits of disturbance in many areas and slightly changing them in others. Cultural resource studies associated with these areas will commence next week. This includes additional archaeological Phase I survey, additional architectural reconnaissance survey, and intensive-level architectural survey. We anticipate that approximately five reports will come out of this work (one archaeological report, one reconnaissance architectural report, and three intensive-level architectural reports). Copies of these documents will be sent to you for your comments upon completion. It is our goal to have them to you by the end of May 2018.

All of these technical studies will be sent to the DHR for formal review of resource eligibility. Once this has been determined, coordination of project effect will commence. This step will occur this summer, likely in July. Information regarding effect recommendations will be sent to you all as it is available, and a second round of in-person consulting party meetings will be set to solicit your feedback on this second round of studies and ongoing coordination.

Concurrent with these cultural resource-specific tasks, the larger project team is continuing to coordinate with cooperating agencies and author the Final Environmental Impact Statement (FEIS). This document will be done this fall. As with the DEIS, information on the FEIS will be sent to you as it is available.

We will be in touch with more information as reports are completed and information is ready for dissemination. In the meantime, as always, if you have any questions, just ask! Cultural resource inquiries can be sent to me, and Emily Stock with the DRPT can answer the larger project queries. My contact info is below, and Emily can be reached at Emily.Stock@drpt.virginia.gov / 804-786-1052.

Best,
Kerri

Hello DC2RVA rail consulting parties,

I hope you are having a great spring! Lots going on over the past few months with the DC2RVA project, so I wanted to provide an update.

- We commenced technical studies on areas in the limits of disturbance and associated area of potential effect that had not been previous investigated in January. Since then, we have done additional archaeological Phase I survey, architectural Phase I/identification-level survey, and intensive architectural documentation. The work resulted in the recordation of an additional 350+ architectural properties and over a dozen archaeological sites at the Phase I level and studies on 52 architectural properties at the Phase II/intensive level to determine NRHP eligibility. These studies have been summarized in five technical reports.

- All five reports have been (or will shortly be) submitted to the DHR for their review. As soon as the last report is finalized, which should be next week, I will get copies of all five reports to you for your files/review. An email on the transfer method will arrive next week with more information.

- These studies, combined with the work done over the past three years, have been culled together to create a list of "historic properties" (resources that are eligible for, assumed eligible for, or listed on the NRHP). We are finalizing this list, and I will send that your way once it is done and the DHR has concurred.

- This list of historic properties will be used to evaluate project effect. This will start in mid-June. MOA production will be underway once effect is determined.

- As I mentioned this winter, we'd like to have a series of meetings to discuss all of this, including the remaining technical studies, resource eligibility, project effect, and MOA stipulations. You are invited to attend any of these meetings in person or via telephone (dial-in information will be sent as the meetings get closer):

> Thursday June 21, 1:00pm-3:00pm= Richmond area. DC2RVA project office. 801 E. Main Street Suite 1000, Richmond.

Tuesday June 26, 10:00am-12:00pm= Fredericksburg area. Dovetail office. 11905 Bowman Drive, Suite 502. Fredericksburg (note: Dovetail just moved a few weeks ago so use this new address!)
Thursday June 28, 10:00am-12:00pm= DC area. Parsons office. 100 M Street SE, Suite 1200, Washington, DC

Additional information will be arriving as the meetings get closer, but pencil a meeting in for now if you are interested and free. Let me know if I can answer any questions in the meantime.

Thanks so much!
Kerri

Hello Consulting Parties!

The five 2018 DC2RVA technical reports are ready for your download. They can be found here: https://www.dropbox.com/sh/ml2a80op238ock1/AADkvZL8qgJN9-485pl0uYIXa?dl=0

A couple of notes:
- Per regulations set forth in the Archaeological Resources Protection Act (ARPA), the archaeological report cannot be disseminated to anyone who is not a consulting party as this report contains site data that is not for public distribution. If you know of someone who is not a consulting party and has questions on archaeological sites, please feel free to pass on my name and contact info and I'm happy to help!

- These five reports include information that was not included in the previous 17 reports that you reviewed last year. This includes areas that were not part of the limits of disturbance at that time, areas associated with the preferred alternative, and intensive-level architectural studies on some of the resources along the alignment to render National Register determinations where needed. If you have any questions on why a resource was/was not included, just ask.

- Please have your comments to me by July 2, 2018 . We are extending this deadline past 30 days so that you can attend one of the consulting party meetings and ask any questions you may have, if you have not asked them in advance via telephone or email. You are more than welcome to submit comments any time before July 2, but we would like to present a cut-off date to help things along.

- Lastly, I've heard from one group that they cannot access Dropbox. I can definitely accommodate any others who may need the documents transferred in another way.

I am absolutely available to talk any time about these reports or the cultural resource process in general. Email or call me (kbarile@dovetailcrg.com/540-899-9170). Have questions about the project? Emily Stock is your gal! She is cc'd here.

Thanks and happy reading!
Kerri and the DC2RVA team

Hello DC2RVA Consulting Parties!

A reminder that the three consulting party meetings are coming up soon; our meeting in Richmond is next week and meetings in Fredericksburg and DC are the following week. Details on the dates, times, and locations of all three meetings are at the bottom of this email. Agendas for all three meetings are attached.

For those who cannot attend in person, we have set up a call-in number and a web link should we need to show some maps:

> https://meet66663673.adobeconnect.com/dc2rva_section_106_consulting_party/
> Call-In Number: 866-583-7984
> Conference Code: 9894625

Please let me know if you will be attending, and, if so, which meeting and if you will be there in person or by phone.

One note: We are having a meeting on historic properties and effect with the DHR on Tuesday, June 19th. As such, I will be sending you their determinations later that evening for you to peruse prior to the consulting party meetings. Just a heads up that the data will be heading your way.

If you have any questions, just let me know.

Looking forward to seeing you!
Kerri

MEETING DETAILS
Thursday June 21, 1:00pm-3:00pm= Richmond area. DC2RVA project office. 801 E. Main Street Suite 1000, Richmond.
Tuesday June 26, 10:00am-12:00pm= Fredericksburg area. Dovetail office. 11905 Bowman Drive, Suite 502. Fredericksburg (note: Dovetail just moved recently so use this new address!)
Thursday June 28, 10:00am-12:00pm= DC area. Parsons office. 100 M Street SE, Suite 1200, Washington, DC

Hello all,

First, don't forget to let me know if you will be attending one of the **upcoming consulting party meetings**. The first one is tomorrow in Richmond, followed by meetings in Fredericksburg and DC. Details on times and locations are below. I've heard from very few of you, so I want to make sure you can attend in person or via phone if you have the opportunity.

Second, yesterday, the DRPT and project team met with the Virginia Department of Historic Resources to provide a project update and go over the list of historic properties. As a reminder, a "historic property" in the Section 106 world is any resource that is eligible for or listed in the National Register of Historic Places. After four years of cultural resource studies, the final list of historic properties for the DC2RVA project corridor contains 118 resources.

Using this list, the DHR provided their determinations on project effect (if the project would diminish the characteristics that render these 118 resources eligible for the NRHP). The three categories of determination were no effect, no adverse effect, and adverse effect. In sum, it was determined that the project would have no effect on 30 resources, no adverse effect on 65 resources, and an adverse effect on 23 resources (nine archaeological sites and 14 above-ground resources).

Please take a look at the attached **project effect letter and table** that were sent to the DHR to confirm their determinations. We are soliciting your feedback on this list and the effect determinations as rendered. Please have your comments to me by **July 20th (30 days)**. We can talk more about effects and historic properties at our upcoming meetings. I'm also always free for email or telephone exchanges with any of you!

Thank you so much and again, let me know if you will be coming to one of the three upcoming meetings. Hoping to see you!
Best,
Kerri

MEETING DETAILS
Thursday June 21, 1:00pm-3:00pm= Richmond area. DC2RVA project office. 801 E. Main Street Suite 1000, Richmond.
Tuesday June 26, 10:00am-12:00pm= Fredericksburg area. Dovetail office. 11905 Bowman Drive, Suite 502. Fredericksburg (note: Dovetail just moved recently so use this new address!)
Thursday June 28, 10:00am-12:00pm= DC area. Parsons office. 100 M Street SE, Suite 1200, Washington, DC

N-S Order	DHR ID	Name/Description	City/County	Date / Time Period	Description	NRHP Eligibility	DHR Effect Determination	Image
1	500-0001	Richmond, Fredericksburg, and Potomac Railroad	Arlington County, City of Alexandria, Fairfax County, Prince William County, Stafford County, City of Fredericksburg, Spotsylvania County, Caroline County, Hanover County, Henrico County, City of Richmond	1836-1943	The RF&P opened in 1836 and eventually spanned from the Potomac River to Richmond. The corridor includes the main rail line, spurs, and associated elements such as station houses, bridges, and other structures.	Eligible under Criterion A	Adverse	
2	029-0218	Mount Vernon Memorial Highway (portion of George Washington Memorial Parkway)	Fairfax County, Arlington County	ca. 1929	The Mount Vernon Memorial Highway is an 8 ½-mile section of the George Washington Memorial Parkway from Fairfax County to the southern boundary of Alexandria. The four-lane wide highway was constructed with concrete slab construction and while much of the concrete remains intact.	Listed under Criteria A and C	No Adverse	
3	000-0045	Washington National Airport (Reagan National Airport)	Arlington County	1941	The primary/historic building is a four-story, multi-bay, airline passenger terminal constructed in the Moderne style. Property also includes six c 1941 airplane hangers and associated runways and other landscape elements.	Listed under Criteria A and C	No Adverse	
4	100-0160	George Washington Junior High School, 1005 Mt. Vernon Avenue	City of Alexandria	1935	The resource is a three-story, multi-bay school building constructed in the Art Deco style originally in a rectangular form. The building is constructed of large, cut, grey sandstone and brick laid in an irregular bond.	Potentially Eligible under C (Assuming eligible for undertaking)	No Effect	
5	100-0133	Parker-Gray Historic District/Uptown	City of Alexandria	ca. 1810	The district covers over 45 blocks in the northwestern quadrant of Old Town Alexandria and abuts the Alexandria Historic District. It consists mainly of small row houses and townhomes built in the mid-to-late nineteenth century.	Listed under Criteria A and C	No Adverse	
6	100-0137	Rosemont Historic District	City of Alexandria	ca. 1900	The district is a planned, residential subdivision that is located northwest of Old Town Alexandria. It consists mainly of small, middle-class houses built between 1908 and 1940.	Listed under Criteria A and C	No Adverse	
7	100-0124	Alexandria Depot, 110 Callahan Drive	City of Alexandria	1905	The train depot known as Alexandria Union Station at 110 Callahan Drive is a one-and-one-half-story, multi-bay, passenger depot constructed in the Colonial Revival style	Listed under Criteria A and C	No Adverse	
8	100-0128	George Washington National Masonic Memorial	City of Alexandria	ca. 1922	The resource at 101 Callahan Drive is a nine-story, multi-bay, memorial and museum sitting on a designed knoll constructed in the Classical Revival style.	Listed under Criterion C and Criteria Consideration F	No Effect	
9	100-0277	Phoenix Mill, 3642 Wheeler Avenue	City of Alexandria	ca. 1776	The building is a two-story, three-bay, industrial building. It is purportedly the "sole remaining example of a mill structure in Alexandria."	Eligible under Criteria A and C	No Adverse	

N-S Order	DHR ID	Name/Description	City/County	Date / Time Period	Description	NRHP Eligibility	DHR Effect Determination	Image
10	029-0953	Old Colchester Road, Potomac Path, King's Highway	Fairfax County	ca. 1664	This two-lane asphalt road runs northeast from the Occoquan River for approximately 4 miles to the intersection with Route 1 in Lorton. Old Colchester Road played an important role in the county's early transportation history.	Eligible under Criterion A	No Effect	
11	029-0043	Colchester Arms, Fairfax Arms, 10712 Old Colchester Road	Fairfax County	ca. 1756	The building ais a one-and-a-half story, four-bay tavern constructed with an irregular four-room plan. The timber-framed structural system rests on a continuous, raised-basement, stone foundation.	Listed under Criteria A and C	No Adverse	12	500-0001-0022	RF&P Bridge over Occoquon River	Prince William County	1915	The resource is a through-truss, camelback railroad bridge constructed close to the middle of the height of this type of structure, 1870-1930. Although once common, few have survived.	Eligible under Criterion C; Contributing to RF&P HD	Adverse	13	076-0023	Rippon Lodge	Prince William County	1747	One of the oldest houses in Prince William County, the vista from Rippon Lodge looking down Neabscro Creek (and future site of the railroad) was documented by Benjamin Latribe.	Listed under Criteria A and B	Adverse	14	44ST1223	Civil War Campsite	Stafford County	1862-1863	This site represents a Civil War campsite occupied during the winter of 1862–1863 when the Union Army was ordered into winter quarters.	Potentially Eligible under Criterion D (Assuming eligible for undertaking)	Adverse	
15	111-0147	Fredericksburg & Spotsylvania Co. Battlefields National Military Park & Cemetery, Lee Drive	City of Fredericksburg	1862	The resource is a Civil War battlefield park composed of earthworks, cannons, and informational markers in addition to a total of 429 non-archaeological cultural resources, 350 of which are considered contributing to its significance.	Listed under Criteria A and D	No Adverse	
16	111-5295	Battle of Fredericksburg I	City of Fredericksburg	1862	The battlefield is the location of a Civil War battle that occurred between December 11 and December 15, 1862. Union Major General Ambrose Burnside and his troops battled General Robert E. Lee's Confederate men, resulting in a Confederate victory. The battlefield continues to retain a high level of integrity.	Eligible/Potentially Eligible under Criterion A	No Adverse	
17	111-5296	Battle of Fredericksburg II	City of Fredericksburg	1863	The Battlefield is a 12,694.2-acre battlefield associated with a Civil War battle of the same name, which took place on May 3, 1863. Despite expansive residential, commercial, and industrial development around the battlefield and the Fredericksburg, it continues to retain a high level of integrity	Eligible/Potentially Eligible under Criterion A	No Adverse	
18	111-0132-0025	Rappahannock River Railroad Bridge and Associated Structures/Platform	City of Fredericksburg	1927	This multiple-span, open-spandrel, concrete-arch bridge is an excellent and rare surviving example of a reinforced-concrete arch railroad bridge within this region of Virginia. It was erected when the station and tracks were elevated for automobile traffic pass through in downtown Fredericksburg.	Eligible under Criterion C; Contributing to Fredericsburg HD and RF&P HD	Adverse	
N-S Order	DHR ID	Name/Description	City/County	Date / Time Period	Description	NRHP Eligibility	DHR Effect Determination	Image
19	44SP0187	Bridge/Marye's Mill	City of Fredericksburg	19th century	Terrestrial portion of the site occupies the location of Marye's Mill, depicted in an 1863 photograph taken during the Second Battle of Fredericksburg and mills identified on Gray's (1878) map of late-nineteenth-century Fredericksburg. Includes cut stone piers that are now located under the waters of the Rappahannock River, which may be associated with earlier railroad structures that are no longer extant.	Potentially Eligible under Criteria A and D (Assuming eligible for undertaking)	Adverse	
20	111-0132	Fredericksburg Historic District	City of Fredericksburg	post 1727	The district is a 200-acre area that comprises the city's downtown commercial area, adjacent industrial area, and some of the surrounding residential blocks. This part of Fredericksburg boasts a wide variety of infrastructure that ranges in date from the early eighteenth century throughout the late twentieth century	Listed under Criterion C	Adverse	
21	44SP0688	Block 49/Train Station	City of Fredericksburg	Late Archaic; 19th/20th c	Archaeological remains of several dwellings, outbuildings, and industrial features as identified by UMW in the early 1990s	Potentially Eligible under Criterion D (Assuming eligible for undertaking)	Adverse	
22	111-0067/ 111-0132-0505	Dr. Charles Mortimer House, House, 213 Caroline Street	City of Fredericksburg	1764-1801	The home is a two-story, five-bay, Federal-style single-family dwelling built circa 1764 in the Georgian style. Dr. Charles Mortimer was an important figure in Fredericksburg's history. The house is also one of a handful of high-style Georgian buildings in Fredericksburg and it is the only example with its original outbuildings.	Eligible under Criteria B and C; Contributing to Fredericksburg HD	No Effect	23	111-0132-0458	Robert Adams Residence, 528 Caroline Street	City of Fredericksburg	1891	The two story, two-bay resource was built in 1891 as a high-style Italianate dwelling. No other high-style, Italianate dwellings are located within the boundaries of the Fredericksburg Historic District.	Eligible under Criterion C; Contributing to Fredericksburg HD	No Effect	24	111-0132-0147	Shiloh Baptist Church New Site, 521 Princess Anne Street	City of Fredericksburg	1890-1968	This 2-story, multi-bay, Colonial Revival-style church was constructed in 1890 and has been an important part of the ante- and post-bellum, African-American community, playing a role in early African-American education and the Civil Rights Movement in Fredericksburg.	Eligible under Criteria A and C and Criteria Consideration A; Contributing to Fredericksburg HD	No Effect	25	44SP0687	Block 48/Train Station	City of Fredericksburg	Late Archaic; 19th/20th c	Archaeological remains of several dwellings, outbuildings, and industrial features as identified by UMW in the early 1990s	Potentially Eligible under Criterion D (Assuming eligible for undertaking)	Adverse	
26	111-0132-0704	Fredericksburg Train Station, 200 Lafayette Boulevard	City of Fredericksburg	1910	The depot is a two-story, five-bay building constructed in the Neoclassical style designed by notable local architect Peck Heflin. The adjacent rail tracks were raised in 1927.	Eligible under Criteria A and C; Contributing to Fredericksburg HD	No Adverse	27	111-0132-0126	The 1770 House, 227 Princess Anne Street	City of Fredericksburg	1770	The home is a one-and-one-half-story dwelling constructed circa 1770 in the Tidewater tradition with some Georgian-style elements. It is a unique example of an eighteenth-century, working-class home in this part of town.	Potentially Eligible under Criterion C (Assuming eligible for undertaking); Contributing to Fredericksburg HD	No Effect	
N-S Order	DHR ID	Name/Description	City/County	Date / Time Period	Description	NRHP Eligibility	DHR Effect Determination	Image
28	111-0132-0020	Purina Tower	City of Fredericksburg	1916	The resource is a one-and-one-half story commercial building with a tall grain elevator at the northwest corner. The tower has become an important landscape landmark within the community.	Eligible under Criteria A and C; Contributing to Fredericksburg HD	No Adverse	29	111-0132-0522	House, 314–316 Frederick Street	City of Fredericksburg	1851	This is a two-story, four-bay vernacular brick duplex. Oral history states that the building was used as a slave jail in the antebellum period.	Eligible under Criteria A and B; Contributing to Fredericksburg HD	No Adverse	30	111-0009-0795	Pulliam's Service Station, 411 Lafayette Boulevard	City of Fredericksburg	ca. 1937	This resource is a one-story filling station constructed in the Spanish Revival style. It still retains its original materials and configuration.	Eligible under Criteria A and C; Contributing to Fredericksburg HD	No Adverse	31	111-0009	Fredericksburg Historic District Extension	City of Fredericksburg	1794-1967	The district extension is a large area that includes a wide variety of resources immediately surrounding the city's downtown core including residences, commercial buildings, and churches dating to the 19th and 20th c.	Eligible under Criteria A and C	No Adverse

109	123-5025	Assault on Petersburg (Petersburg Battlefield II), Bermuda Hundred Road (Alt Route 697)	Charles City County, Chesterfield County, City of Colonial Heights, City of Hopewell, City of Petersburg, Prince George County	1865	This resource includes a Civil War battlefield that represents part of the Richmond Petersburg campaign in and around Petersburg. Today, the battlefield consists of earthworks, roadways, and other features as well as interpretive materials.	Eligible under Criterion A	No Adverse	
110	020-5336	The Bellwood-Richmond Quartermaster Depot Historic District, US Department of Defense Supply Center Historic District	Chesterfield County	post-1942	The district is a group of residential, industrial, and military buildings dating from the construction Sheffield/Bellwood Manor (020-0007), circa 1804, to the development of the Korean Conflict era buildings in 1952	Eligible under Criteria A, B, C, D	No Adverse	
111	020-0007	Bellwood, Sheffields, Auburn Chase, Building 42, Defense Supply Center Richmond, 8000 Jefferson Davis Hwy	Chesterfield County	1804	This resource is significant as a representative of an early-nineteenth century antebellum plantation that has evolved into a modern, twentieth-century farm and dairying operation. The main house is an excellent example of vernacular interpretaion of the Early Classical Revival style in the piedmont area constructed in an I-form. Numerous archaeological resources are located on the parcel.	Listed under Criteria A, C, and D	No Adverse	
112	44CF0680 / 020-0022	Fort Darling/Battlefield, Earthworks, Fort/ Centralia Earthworks	Chesterfield County	1861-1865	The earthworks were developed by Confederate troops as part of the Outer Line of defenses for Drewry's Bluff. Although some segments of the earthworks has been destroyed, the extant areas remain in excellent condition and the remaining elements of the artillary battery, trenches, and gun emplacements are representative of earthworks developed in this area during the Civil War.	Eligible under Criteria A, C, and D	No Adverse	
113	020-5351	Richmond & Petersburg Electric Railway	Chesterfield County	1902	This resource contains the alignment of the regional trolley system. Creation of this line was the direct impetus for large-scale modifications to settlement patterns in central Virginia.	Eligible under Criterion A	No Adverse	
114	020-0013	House, 3619 Thurston Road	Chesterfield County	1913	This resource is a 1.5-story Colonial Revival dwelling with a gambrel roof and flared eaves. It retains a high degree of architectural integrity.	Eligible under Criterion C	No Effect	
115	127-6251	Atlantic Coast Line Railroad Corridor, Richmond and Petersburg Railroad	City of Richmond, Chesterfield County	post 1833	Historic railroad corridor that represents the origins and growth of the railroad industry in the Richmond to Petersburg corridor; reflects the post-Civil War trend of merging smaller operations to provide better service while being more economical	Eligible under Criterion A	No Adverse	
116	020-5378	VEPCo Power Transmission Line	Chesterfield County	ca. 1910	The VEPCo Line was built The line was built sometime between 1910 and 1930, likely between 1925 and 1927, providing high-voltage electric power service to the people in the area. It is approximately one mile long, and it is the only remaining portion of the line that once extended from Richmond to Petersburg.	Eligible under Criteria A and C	No Effect	
117	020-0140	Circle Oaks/4510 Centralia Road	Chesterfield County	1840	This resource is a two-story, wood frame single-family dwelling featuring a two-story, wrap around veranda. Property includs a small tenant house (perhaps servant's quarters) and a kitchen. Circle Oaks is the oldest and largest building in the community.	Eligible under Criterion C	No Adverse	

N-S Order	DHR ID	Name/Description	City/County	Date / Time Period	Description	NRHP Eligibility	DHR Effect Determination	Image
118	020-0552	Centralia Post Office	Chesterfield County	1905	The one-story building was the center of the community of Centralia. It was constructed to face east onto the rail tracks to accommodate rail travelers through this area during the economic boom of the pre-World War I days.	Eligible under Criterion A	No Adverse

Hey all!

Thank you so very much to everyone who participated in our consulting party meetings over the past few weeks for the DC2RVA rail project. We are extraordinarily thankful for your continued feedback. I wanted to pass around a few things that have occurred since our meeting.

- FRA, DRPT, and the team held a call with the DHR on Monday, July 2 to provide them with an update of the consulting party meetings and to address several key items that came up. I've shared the info with the pertinent parties but in sum, a more robust dialogue was held on why this project and the Long Bridge rail project to the north are separate undertakings; Masons' Hall in Richmond has been added to the list of historic properties; and Devil's Half Acre/Lumpkins Jail and the Burial Ground in Shockoe have not been added to the list as individual resources but are being mitigated through adverse effects in the 106 process to the surrounding Shockoe Valley and Tobacco Row Historic District.

- Given this dialogue, the list of historic properties has expanded by one to include Masons' Hall. See the revised attached list.

- Also attached is the MOA for the Virginia segment of the Richmond to Raleigh (R2R) SEHSR project. I wanted to provide this to you so you can see some of the mitigations that were proposed for adverse effects on the sister project to the south. This may help you in thinking about mitigation strategies for the adverse effects from this project. Note, though, that the current project corridor and the R2R corridor overlap between Richmond and Centralia but project plans have slightly changed. Use the effect determinations for DC2RVA rather than R2R in these cases, such as the Williams Bridge Company.

- As a reminder, comments on the technical reports, list of historic properties and project effect are due by **July 20th**.

Again, we are so deeply appreciative of your feedback on this project and look forward to our next set of calls to chat mitigation.

Thanks!
Kerri and team

N-S Order	DHR ID	Name/Description	City/County	Date / Time Period	Description	NRHP Eligibility	DHR Effect Determination	Image
1	500-0001	Richmond, Fredericksburg, and Potomac Railroad	Arlington County, City of Alexandria, Fairfax County, Prince William County, Stafford County, City of Fredericksburg, Spotsylvania County, Caroline County, Hanover County, Henrico County, City of Richmond	1836-1943	The RF&P opened in 1836 and eventually spanned from the Potomac River to Richmond. The corridor includes the main rail line, spurs, and associated elements such as station houses, bridges, and other structures.	Eligible under Criterion A	Adverse	
2	029-0218	Mount Vernon Memorial Highway (portion of George Washington Memorial Parkway)	Fairfax County, Arlington County	ca. 1929	The Mount Vernon Memorial Highway is an 8 ½-mile section of the George Washington Memorial Parkway from Fairfax County to the southern boundary of Alexandria. The four-lane wide highway was constructed with concrete slab construction and while much of the concrete remains intact.	Listed under Criteria A and C	No Adverse	
3	000-0045	Washington National Airport (Reagan National Airport)	Arlington County	1941	The primary/historic building is a four-story, multi-bay, airline passenger terminal constructed in the Moderne style. Property also includes six c 1941 airplane hangers and associated runways and other landscape elements.	Listed under Criteria A and C	No Adverse	
4	100-0160	George Washington Junior High School, 1005 Mt. Vernon Avenue	City of Alexandria	1935	The resource is a three-story, multi-bay school building constructed in the Art Deco style originally in a rectangular form. The building is constructed of large, cut, grey sandstone and brick laid in an irregular bond.	Potentially Eligible under C (Assuming eligible for undertaking)	No Effect	5	100-0133	Parker-Gray Historic District/Uptown	City of Alexandria	ca. 1810	The district covers over 45 blocks in the northwestern quadrant of Old Town Alexandria and abuts the Alexandria Historic District. It consists mainly of small row houses and townhomes built in the mid-to-late nineteenth century.	Listed under Criteria A and C	No Adverse	
6	100-0137	Rosemont Historic District	City of Alexandria	ca. 1900	The district is a planned, residential subdivision that is located northwest of Old Town Alexandria. It consists mainly of small, middle-class houses built between 1908 and 1940.	Listed under Criteria A and C	No Adverse	
7	100-0124	Alexandria Depot, 110 Callahan Drive	City of Alexandria	1905	The train depot known as Alexandria Union Station at 110 Callahan Drive is a one-and-one-half-story, multi-bay, passenger depot constructed in the Colonial Revival style	Listed under Criteria A and C	No Adverse	8	100-0128	George Washington National Masonic Memorial	City of Alexandria	ca. 1922	The resource at 101 Callahan Drive is a nine-story, multi-bay, memorial and museum sitting on a designed knoll constructed in the Classical Revival style.	Listed under Criterion C and Criteria Consideration F	No Effect	9	100-0277	Phoenix Mill, 3642 Wheeler Avenue	City of Alexandria	ca. 1776	The building is a two-story, three-bay, industrial building. It is purportedly the "sole remaining example of a mill structure in Alexandria."	Eligible under Criteria A and C	No Adverse	
N-S Order	DHR ID	Name/Description	City/County	Date / Time Period	Description	NRHP Eligibility	DHR Effect Determination	Image
10	029-0953	Old Colchester Road, Potomac Path, King's Highway	Fairfax County	ca. 1664	This two-lane asphalt road runs northeast from the Occoquan River for approximately 4 miles to the intersection with Route 1 in Lorton. Old Colchester Road played an important role in the county's early transportation history.	Eligible under Criterion A	No Effect	
11	029-0043	Colchester Arms, Fairfax Arms, 10712 Old Colchester Road	Fairfax County	ca. 1756	The building ais a one-and-a-half story, four-bay tavern constructed with an irregular four-room plan. The timber-framed structural system rests on a continuous, raised-basement, stone foundation.	Listed under Criteria A and C	No Adverse	12	500-0001-0022	RF&P Bridge over Occoquon River	Prince William County	1915	The resource is a through-truss, camelback railroad bridge constructed close to the middle of the height of this type of structure, 1870-1930. Although once common, few have survived.	Eligible under Criterion C; Contributing to RF&P HD	Adverse	13	076-0023	Rippon Lodge	Prince William County	1747	One of the oldest houses in Prince William County, the vista from Rippon Lodge looking down Neabsco Creek (and future site of the railroad) was documented by Benjamin Latrobe.	Listed under Criteria A and B	Adverse	14	44ST1223	Civil War Campsite	Stafford County	1862-1863	This site represents a Civil War campsite occupied during the winter of 1862–1863 when the Union Army was ordered into winter quarters.	Potentially Eligible under Criterion D (Assuming eligible for undertaking)	Adverse	
15	111-0147	Fredericksburg & Spotsylvania Co. Battlefields National Military Park & Cemetery, Lee Drive	City of Fredericksburg	1862	The resource is a Civil War battlefield park composed of earthworks, cannons, and informational markers in addition to a total of 429 non-archaeological cultural resources, 350 of which are considered contributing to its significance.	Listed under Criteria A and D	No Adverse	
16	111-5295	Battle of Fredericksburg I	City of Fredericksburg	1862	The battlefield is the location of a Civil War battle that occurred between December 11 and December 15, 1862. Union Major General Ambrose Burnside and his troops battled General Robert E. Lee's Confederate men, resulting in a Confederate victory. The battlefield continues to retain a high level of integrity.	Eligible/Potentially Eligible under Criterion A	No Adverse	
17	111-5296	Battle of Fredericksburg II	City of Fredericksburg	1863	The Battlefield is a 12,694.2-acre battlefield associated with a Civil War battle of the same name, which took place on May 3, 1863. Despite expansive residential, commercial, and industrial development around the battlefield and the Fredericksburg, it continues to retain a high level of integrity	Eligible/Potentially Eligible under Criterion A	No Adverse	
18	111-0132-0025	Rappahannock River Railroad Bridge and Associated Structures/Platform	City of Fredericksburg	1927	This multiple-span, open-spandrel, concrete-arch bridge is an excellent and rare surviving example of a reinforced-concrete arch railroad bridge within this region of Virginia. It was erected when the station and tracks were elevated for automobile traffic pass through in downtown Fredericksburg.	Eligible under Criterion C; Contributing to Fredericksburg HD and RF&P HD	Adverse	
N-S Order	DHR ID	Name/Description	City/County	Date / Time Period	Description	NRHP Eligibility	DHR Effect Determination	Image
19	44SP0187	Bridge/Marye's Mill	City of Fredericksburg	19th century	Terrestrial portion of the site occupies the location of Marye's Mill, depicted in an 1863 photograph taken during the Second Battle of Fredericksburg and mills identified on Gray's (1878) map of late-nineteenth-century Fredericksburg. Includes cut stone piers that are now located under the waters of the Rappahannock River, which may be associated with earlier railroad structures that are no longer extant.	Potentially Eligible under Criteria A and D (Assuming eligible for undertaking)	Adverse	
20	111-0132	Fredericksburg Historic District	City of Fredericksburg	post 1727	The district is a 200-acre area that comprises the city's downtown commercial area, adjacent industrial area, and some of the surrounding residential blocks. This part of Fredericksburg boasts a wide variety of infrastructure that ranges in date from the early eighteenth century throughout the late twentieth century	Listed under Criterion C	Adverse	
21	44SP0688	Block 49/Train Station	City of Fredericksburg	Late Archaic; 19th/20th c	Archaeological remains of several dwellings, outbuildings, and industrial features as identified by UMW in the early 1990s	Potentially Eligible under Criterion D (Assuming eligible for undertaking)	Adverse	
22	111-0067/ 111-0132-0505	Dr. Charles Mortimer House, House, 213 Caroline Street	City of Fredericksburg	1764-1801	The home is a two-story, five-bay, Federal-style single-family dwelling built circa 1764 in the Georgian style. Dr. Charles Mortimer was an important figure in Fredericksburg's history. The house is also one of a handful of high-style Georgian buildings in Fredericksburg and it is the only example with its original outbuildings.	Eligible under Criteria B and C; Contributing to Fredericksburg HD	No Effect	23	111-0132-0458	Robert Adams Residence, 528 Caroline Street	City of Fredericksburg	1891	The two story, two-bay resource was built in 1891 as a high-style Italianate dwelling. No other high-style, Italianate dwellings are located within the boundaries of the Fredericksburg Historic District.	Eligible under Criterion C; Contributing to Fredericksburg HD	No Effect	24	111-0132-0147	Shiloh Baptist Church New Site, 521 Princess Anne Street	City of Fredericksburg	1890-1968	This 2-story, multi-bay, Colonial Revival-style church was constructed in 1890 and has been an important part of the ante- and post-bellum, African-American community, playing a role in early African-American education and the Civil Rights Movement in Fredericksburg.	Eligible under Criteria A and C and Criteria Consideration A; Contributing to Fredericksburg HD	No Effect	25	44SP0687	Block 48/Train Station	City of Fredericksburg	Late Archaic; 19th/20th c	Archaeological remains of several dwellings, outbuildings, and industrial features as identified by UMW in the early 1990s	Potentially Eligible under Criterion D (Assuming eligible for undertaking)	Adverse	
26	111-0132-0704	Fredericksburg Train Station, 200 Lafayette Boulevard	City of Fredericksburg	1910	The depot is a two-story, five-bay building constructed in the Neoclassical style designed by notable local architect Peck Heflin. The adjacent rail tracks were raised in 1927.	Eligible under Criteria A and C; Contributing to Fredericksburg HD	No Adverse	27	111-0132-0126	The 1770 House, 227 Princess Anne Street	City of Fredericksburg	1770	The home is a one-and-one-half-story dwelling constructed circa 1770 in the Tidewater tradition with some Georgian-style elements. It is a unique example of an eighteenth-century, working-class home in this part of town.	Potentially Eligible under Criterion C (Assuming eligible for undertaking); Contributing to Fredericksburg HD	No Effect	
N-S Order	DHR ID	Name/Description	City/County	Date / Time Period	Description	NRHP Eligibility	DHR Effect Determination	Image
28	111-0132-0020	Purina Tower	City of Fredericksburg	1916	The resource is a one-and-one-half story commercial building with a tall grain elevator at the northwest corner. The tower has become an important landscape landmark within the community.	Eligible under Criteria A and C; Contributing to Fredericksburg HD	No Adverse	111-0132-0020
29	111-0132-0522	House, 314–316 Frederick Street	City of Fredericksburg	1851	This is a two-story, four-bay vernacular brick duplex. Oral history states that the building was used as a slave jail in the antebellum period.	Eligible under Criteria A and B; Contributing to Fredericksburg HD	No Adverse	111-0132-0522
30	111-0009-0795	Pulliam's Service Station, 411 Lafayette Boulevard	City of Fredericksburg	ca. 1937	This resource is a one-story filling station constructed in the Spanish Revival style. It still retains its original materials and configuration.	Eligible under Criteria A and C; Contributing to Fredericksburg HD	No Adverse	111-0009-0795
31	111-0009	Fredericksburg Historic District Extension	City of Fredericksburg	1794-1967	The district extension is a large area that includes a wide variety of resources immediately surrounding the city's downtown core including residences, commercial buildings, and churches dating to the 19th and 20th c.	Eligible under Criteria A and C	No Adverse	
32	088-5181	Salem Church Battlefield (Banks Ford Battlefield)	Spotsylvania County, City of Fredericksburg	1863	The battlefield includes the land where Hay's and Hoke's brigades attacked the Union Sixth Corps in 1863. It includes Confederate earthworks, Salem Church, and the path of the Plank Road.	Eligible under Criterion A	No Adverse	
33	088-5364	Virginia Central Railway Historic District	City of Fredericksburg, Spotsylvania County, and more	1853	The district is a 38-mile-long railroad corridor that extends west from the CSX railroad (formerly the RF&P) in Fredericksburg to the town of Orange encompassing rail-related structures, sites, and landscape features. The 3.5-mile long eastern section is eligible.	Eligible under Criterion A	No Adverse	
34	111-0145	Fredericksburg Gun Manufactory	City of Fredericksburg	ca. 1775	The Fredericksburg Gun Manufactory is an archaeological site that is at least 75 percent intact. The remains of the manufacturing facility are located beneath a paved asphalt parking lot for a public school.	Listed under Criteria A and D	No Adverse	
35	088-0254	Slaughter Pen Farm, 11232 Tidewater Trail (Wayside Farm or Pierson Farm)	Spotsylvania County	ca. 1861	Slaughter Pen Farm, also known as Wayside Farm or Pierson Farm, is a 19th century farm complex composed of a two-story, three-bay, Italianate-style, single-family dwelling, three agricultural outbuildings, a shed, one kitchen, a slave quarters, and a well.	Eligible under Criterion A	No Adverse	
36	44SP0468	Earthwork/ Jackson's Earthwork	Spotsylvania County	1861	This resource includes a set of earthworks within a larger archaeological site. The area is almost totally enclosed by lines of military shelter trenches constructed prior to or following the First Battle of Fredericksburg.	Potentially Eligible under Criteria A, C and D (Assuming eligible for undertaking)	Adverse	

N-S Order	DHR ID	Name/Description	City/County	Date / Time Period	Description	NRHP Eligibility	DHR Effect Determination	Image
37	088-0039	La Vue, 3232 LaVue Lane (Prospect View)	Spotsylvania County	ca. 1848	La Vue, also known as Prospect View, is a two-story, three-bay, single-family dwelling constructed in the Greek Revival style with an L-plan.	Listed under Criterion C	No Adverse	
38	016-0092	Fairfield Plantation Office, Jackson Shrine, 12019 Stonewall Jackson Road	Caroline County	1828	The resource is a one-and-a-half-story frame building; it once served as the office for the 740-acre Fairfield Plantation and is the only surviving building. On May 10, 1863, Confederate General Thomas Jonathan "Stonewall" Jackson died at the site after being wounded at the Battle of Chancellorsville.	Eligible under Criteria A and C	No Adverse	
39	016-0208	House, 12096 Guinea Drive	Caroline County	ca. 1900	The resource is a is a one-and-a-half-story vernacular dwelling with Queen Anne and Craftsman elements. The house was built from a kit purchased from the Sears & Roebuck Company.	Potentially Eligible under Criterion C (Assuming eligible for undertaking)	No Effect	
40	016-5165	Excelsior Industry of Caroline County MPD	Caroline County	ca. 1925-1960	This is a thematic collection of resources that are associated with the manufacture of excelsior, Caroline County's largest industry in the early twentieth century	Eligible under Criteria A and C	No Adverse	
41	016-0223	First Woodford Post Office	Caroline County	1874	This small frame office building is located immediately adjacent to the railroad and is associated with the Woodford Excelsior Company, Caroline County's first excelsior manufacturer. It was the focal point of the operation.	Eligible under Criteria A and C	No Adverse	
42	016-0222	Woodford Freight & Passenger Depot, Woodford Road	Caroline County	ca. 1900	The resource is a long, rectangular, one-story, framed building constructed circa 1900. The building served a combined function as both a freight depot and a passenger depot and was one of five original stops along the RF&P in Caroline County.	Eligible under Criteria A and C; Contributing to RF&P HD	No Adverse	
43	016-0220	Carolina Mansion, 11146 Woodford Road	Caroline County	ca. 1900	The ornate, two-and-a-half-story, wood framed dwelling was designed in the Queen Anne style with Classical detailing. The building represents housing constructed in the area in the early-twentieth century, when the RF&P and new manufacturing enterprises brought economic prosperity to the local region.	Potentially Eligible under Criterion C (Assuming eligible for undertaking)	No Effect	
44	016-5136	Milford Historic District	Caroline County	ca. 1880–1960	The district was originally established in the late-eighteenth century as a tobacco trading center. In 1836, the RF&P Railroad was constructed through the area and Milford soon became the largest of the small communities in the county situated along the railroad.	Eligible under Criteria A and C	No Adverse	
45	016-0270	Milford State Bank, 15461 Antioch Road	Caroline County	ca. 1910	The bank is a two-story brick building constructed in the Classical Revival style. The building's façade is divided into five distinct bays via brick pilasters. It is the only Classical Revival building as well as the only bank in the village of Milford.	Potentially Eligible under Criterion C (Assuming eligible for undertaking)	No Adverse	

N-S Order	DHR ID	Name/Description	City/County	Date / Time Period	Description	NRHP Eligibility	DHR Effect Determination	Image
46	016-0286	Coghill-Jeter Store, 22275 Penola Road; Penola, 16095 Polecat Lane	Caroline County	1880	The resource is a two-story, wood-framed commercial building. It is the only surviving commercial building in the largely abandoned village of Penola and is representative of the small country stores once found in crossroads communities and railroad stops throughout the area.	Eligible under Criteria A and C	No Adverse	
47	042-0123	North Anna Battlefield	Hanover County	1864	The North Anna Battlefield was the location of one of the most important Civil War campaigns in the state. It was the culminating point of the 1864 Overland Campaign. The battlefield is composed of defensive earthworks and trenches, as well as other elements predating and contemporaneous with the battle.	Eligible under Criterion A	No Adverse	
48	042-5448	Doswell Historic District	Hanover County	ca. 1880-1940	Doswell Historic District encompasses a rural community that was once a center of major activity along road and rail networks. Nearly a dozen historic properties are located within the district's boundaries.	Eligible under Criteria A and C	Adverse	
49	042-0093	Doswell Depot and Tower, 10577 Doswell Rd	Hanover County	ca. 1928	The current depot is a well-balanced design with classical-styled architectural features. The nearby, contemporaneous "HN tower" housed electrical systems managing an interlocking device permitting safe crossing of trains over both railroads.	Eligible under Criteria A and C; Contributes to RF&P HD and Doswell HD	Adverse	
50	042-5307	Taylorsville Road Historic District	Hanover County	ca. 1900-1935	The community was settled in the early–nineteenth century and has remained active to present day. Most built features are residential and agricultural in nature within the district and reflect architectural styles and construction methods from the late-nineteenth to mid-twentieth century.	Eligible under Criteria A and C	No Adverse	
51	042-0556	Hoopers, 11108 McConnell Lane	Hanover County	1810	Resource was recorded during the LOD survey document but it was not accessible during the study; DHR suggested that it be considered potentially eligible for the project on April 4, 2018	Not evaluated; Not accessible (Assuming eligible for undertaking)	No Effect	
52	166-5073	Berkleytown Historic District	Hanover County	ca. 1900-1965	The district is typical of many small-town, twentieth-century, African-American neighborhoods in that it was relatively isolated from the formal downtown core and is dotted by small vernacular dwellings.	Eligible under Criterion A	Adverse	
53	166-0001	Ashland Historic District	Hanover County	1850-1950	The Ashland Historic District, with its large collection of late-Victorian and Edwardian frame dwellings and its brick commercial core, all set among hundreds of trees, survives as a fine example of a railroad and streetcar suburb preserving much of its turn-of-the-century character.	Listed under Criteria A and C	No Adverse	
54	166-0001-0015	Business Office, Randolph-Macon , 310 N. Center Street	Hanover County	ca. 1895	Historically known as the Blackwell House, it is an elaborate and outstanding example of Queen Anne-styled architecture with Eastlake elements in this historic community.	Potentially Eligible under C (Assuming eligible for undertaking); Contributing to Ashland HD	No Effect	

N-S Order	DHR ID	Name/Description	City/County	Date / Time Period	Description	NRHP Eligibility	DHR Effect Determination	Image
55	166-5072	Randolph-Macon College Historic District Expansion	Hanover County	ca. 1900-1960	The Randolph-Macon College Historic District Expansion highlights a significant part of campus that developed between the early-twentieth century up to the mid-1960s when a substantial building boom occurred.	Potentially Eligible under Criteria A and C (Assuming eligible for undertaking)	No Effect	
56	166-0002	Randolph-Macon College Historic District	Hanover County	1872-1950	The district includes the 85-acre college campus and all associated buildings, structures and landscape features. This is the oldest Methodist-related college in the United States still in operation	Listed under Criteria A and C	No Effect	
57	166-0001-0008	Ashland Station Depot, 112 N. Railroad Avenue	Hanover County	1910	The one-story, five-bay, brick depot is said to have been designed by W. P. Lee to replace a previous circa-1890 station that had burned. The building appears little altered and is a good example of a Colonial Revival-styled depot.	Potentially Eligible under A and C (Assuming eligible for undertaking); Contributing to Ashland HD	No Effect	166-0001-0008
58	166-5041	Priddy House, 107 Stebbins Street	Hanover County	ca. 1926	This one-and-a-half-story, four-bay, single-family dwelling is an outstanding example of Craftsman-styled domestic architecture in this community.	Potentially Eligible under Criterion C (Assuming eligible for undertaking); Contributing to Ashland HD	No Effect	
59	166-0001-0055	Emily Gray House, 702 S. Center Street	Hanover County	ca. 1850	Historically known as the Emily Gray House, this one-and-a-half-story, three-bay resource is an outstanding example of Second Empire-styled architecture.	Potentially Eligible under Criterion C (Assuming eligible for undertaking); Contributing to Ashland HD	No Effect	166-0001-0055
60	166-0001-0060	Fleming Fox House, 708 S. Center Street	Hanover County	ca. 1894	Historically known as the Fleming Fox House, this two-and-a-half-story, four-bay dwelling is an outstanding example of a Colonial Revival-styled dwelling with Free Classic elements.	Potentially Eligible under Criterion C (Assuming eligible for undertaking); Contributing to Ashland HD	No Effect	166-0001-0060
61	166-0036	MacMurdo House, 713 S. Center Street	Hanover County	ca. 1858	This two-story, three-bay, Greek Revival, single-family dwelling is one of the few buildings of its style in Ashland, and it has excellent historic integrity.	Potentially Eligible under Criterion C (Assuming eligible for undertaking); Contributing to Ashland HD	No Effect	
62	166-0037	Hugo House/Lefebvre House, 904 S. Central Street	Hanover County	ca. 1886	This two-story, three-bay, Queen-Anne, frame dwelling is an elaborate and outstanding example of Queen Anne-styled architecture in the community.	Potentially Eligible under Criterion C (Assuming eligible for undertaking); Contributing to Ashland HD	No Effect	
63	166-0001-0077	House, 1005 S. Center Street	Hanover County	ca. 1890	This two-and-a-half-story, four-bay, Folk Victorian dwelling possesses characteristics of Queen Anne while its form and orientation suggest an earlier construction date.	Potentially Eligible under Criterion C (Assuming eligible for undertaking); Contributing to Ashland HD	No Effect	166-0001-0077

100	127-6193	J.P. Taylor Leaf Tobacco, Southern Stove Works, 516 Dinwiddie Ave	City of Richmond	1920	This resource mirrors other early-20th century factories in the area: all brick construction, with regularly spaced and relatively large windows, and sections of light monitor on the pitched roof apex for allowing natural light for the workers. It was used as a stove factory and then for tobacco processing.	Listed under Criteria A and C	No Adverse	
101	127-6245	Williams Bridge Company, Emergency Fleet Corporation Factory, 700 East 4th Street	City of Richmond	1919	Built in 1919 to assist with World War I war efforts; also used by the US government during World War II; eligible boundary contains main factory and apartment structures used to house workers during both world wars .	Eligible under Criteria A, C, and D	No Adverse	
102	127-6248	Pure Oil Company, 1314 Commerce Street, Transmontaigne	City of Richmond	1936	This property has been used to refine, store, ship, and process oil extracts for almost 80 years; founded in 1928 as Gulf Refinery Company; associated with the history of oil production and transport in Richmond	Eligible under Criteria A and C	No Adverse	
103	127-6213	Davee Gardens Historic District	City of Richmond	1947	This district is a planned, symmetrical suburb of Richmond, established in 1947. Homes in the neighborhood retain a high degree of historic integrity, and the street plan is emblematic of post World War II design.	Eligible under Criteria A and C	No Adverse	
104	127-5818	Philip Morris Operations Complex, 3601 Commerce Road	City of Richmond	1959–1974	This is a mid-twentieth-century, light-industrial complex that serves as headquarters for the company’s tobacco production. They are unique industrial-related building constructed in the post-modern Neoexpressionist and Brutalist styles.	Eligible under Criteria A and C and Criteria Consideration G	No Adverse	
105	020-5474	DuPont Spruance	Chesterfield County	1929	The first of several buildings on the DuPont Spruance Plant was constructed under the ownership DuPont Rayon Co. This large factory has played a significant role in the development of textiles and plastics in the United States.	Eligible under Criteria A and C	No Effect	
106	043-0307	Battle of Chaffin's Farm (New Market Heights Battlefield), New Market Road	Chesterfield County, Henrico County, City of Richmond	1862	The Battle of New Market Heights is nationally significant because of the all-important role played by Black soldiers in this fight and the recognition of their gallantry by the United States government through the award of 14 Medals of Honor to participants.	Eligible under Criterion A	No Adverse	
107	020-0063	Falling Creek Ironworks Archaeological Site	Chesterfield County	1619	The Falling Creek Ironwork archaeological site was originally recorded as the location of the Virginia Company Ironworks. Subsequent investigation suggests that it could also be Cary's Ironworks, destroyed in 1781 during the American Revolution.	Listed under Criterion D	No Adverse	
108	020-5320	Proctor's Creek Battlefield	Chesterfield County, Colonial Heights	1864	Currently the battlefield consists of monuments, interpretive markers (state and freeman markers/park service interpretation at Fort Darling unit/county interpretation at Fort Stephens), a cemetery, historic road beds, period structures (Wooldridge, Willis, Halfway houses), and trenches/field fortifications.	Eligible/Potentially Eligible under Criterion A	No Adverse	PROCTOR'S CREEK FIGHT

N-S Order	DHR ID	Name/Description	City/County	Date / Time Period	Description	NRHP Eligibility	DHR Effect Determination	Image
109	020-0147	Drewry's Bluff Battlefield (Fort Darling, Fort Drewry), Fort Darling Road	Chesterfield County, Henrico County	1862	Drewry's Bluff encompasses 42.4 acres of land. The CCC camp based at Fort Harrison rehabilitated the site in 1935, clearing brush and trees and stabilizing the earthworks.	Eligible under Criterion A	No Adverse	
110	123-5025	Assault on Petersburg (Petersburg Battlefield II), Bermuda Hundred Road (Alt Route 697)	Charles City County, Chesterfield County, City of Colonial Heights, City of Hopewell, City of Petersburg, Prince George County	1865	This resource includes a Civil War battlefield that represents part of the Richmond Petersburg campaign in and around Petersburg. Today, the battlefield consists of earthworks, roadways, and other features as well as interpretive materials.	Eligible under Criterion A	No Adverse	
111	020-5336	The Bellwood-Richmond Quartermaster Depot Historic District, US Department of Defense Supply Center Historic District	Chesterfield County	post-1942	The district is a group of residential, industrial, and military buildings dating from the construction Sheffield/Bellwood Manor (020-0007), circa 1804, to the development of the Korean Conflict era buildings in 1952	Eligible under Criteria A, B, C, D	No Adverse	
112	020-0007	Bellwood, Sheffields, Auburn Chase, Building 42, Defense Supply Center Richmond, 8000 Jefferson Davis Hwy	Chesterfield County	1804	This resource is significant as a representative of an early-nineteenth century antebellum plantation that has evolved into a modern, twentieth-century farm and dairying operation. The main house is an excellent example of vernacular interpretation of the Early Classical Revival style in the piedmont area constructed in an I-form. Numerous archaeological resources are located on the parcel.	Listed under Criteria A, C, and D	No Adverse	
113	44CF0680 / 020-0022	Fort Darling/Battlefield, Earthworks, Fort/ Centralia Earthworks	Chesterfield County	1861-1865	The earthworks were developed by Confederate troops as part of the Outer Line of defenses for Drewry's Bluff. Although some segments of the earthworks has been destroyed, the extant areas remain in excellent condition and the remaining elements of the artillery battery, trenches, and gun emplacements are representative of earthworks developed in this area during the Civil War.	Eligible under Criteria A, C, and D	No Adverse	
114	020-5351	Richmond & Petersburg Electric Railway	Chesterfield County	1902	This resource contains the alignment of the regional trolley system. Creation of this line was the direct impetus for large-scale modifications to settlement patterns in central Virginia.	Eligible under Criterion A	No Adverse	
115	020-0013	House, 3619 Thurston Road	Chesterfield County	1913	This resource is a 1.5-story Colonial Revival dwelling with a gambrel roof and flared eaves. It retains a high degree of architectural integrity.	Eligible under Criterion C	No Effect	
116	127-6251	Atlantic Coast Line Railroad Corridor, Richmond and Petersburg Railroad	City of Richmond, Chesterfield County	post 1833	Historic railroad corridor that represents the origins and growth of the railroad industry in the Richmond to Petersburg corridor; reflects the post-Civil War trend of merging smaller operations to provide better service while being more economical	Eligible under Criterion A	No Adverse	
117	020-5378	VEPCo Power Transmission Line	Chesterfield County	ca. 1910	The VEPCo Line was built The line was built sometime between 1910 and 1930, likely between 1925 and 1927, providing high-voltage electric power service to the people in the area. It is approximately one mile long, and it is the only remaining portion of the line that once extended from Richmond to Petersburg.	Eligible under Criteria A and C	No Effect

Hello Consulting Parties!

Just a quick reminder that comments on the five 2018 technical reports, list of historic properties, and project effect are due tomorrow, July 20, 2018, by COB eastern time. I've already received comments from several of you but I know that others are planning on submitting materials. Emailed replies are just fine. Once I receive everyone's feedback, it will be disseminated to the FRA, DRPT, DHR, and project team.

Also, I'll be initiating conversations on mitigation of the 23 resources that have received an adverse effect determination in the next few weeks so there absolutely will be more opportunities to comment!

Thanks so much,
Kerri
